He said he held strongly that the nationalisation of the cables was the right course to follow. The proposals of Mr. Samuel were very important and constituted steps in the right direction, but the rates could be put on a satisfactory basis only by the Governments interested owning the cables. If they could arrive at an arrangement by which they took over the private companies on reasonable terms, it would be one of the finest things ever done for the Empire, and he belived it would be a good commercial transaction. If the Atlantic cables were British-owned, it ought to be possible to come to an understanding that if the companies were not willing to sell their cables at market value the Governments of the Empire would put down a cable or cables of their own. Even at a cost of £500,000 for the cable alone, he believed a substantial result would be obtained. The Government contributions, considered as a subsidy, would be a very small matter, but the resultant advantages would be immense. He thought the Conference ought to suggest the desirability of such a State-owned link being provided. With regard to the proposed second cable between Australia and New Zealand, its refusal by the British Treasury was regrettable. The reason given, the possible development of wireless telegraphy, was likely to result in no advance being made.

Dr. FINDLAY said the position in Australia and New Zealand was essentially different from the position on this side. They had to rely on the cable for all their outside news, and the question was, therefore, too large a one to be treated on a purely commercial basis.

Sir D. DE V. GRAAFF said the system of control foreshadowed by Mr. Samuel was a great step in the right direction. The nationalisation of cables might be desirable, but it was a question whether the present was the right time to undertake it. The first part of the resolution aimed at reduction of rates. A further point was the Government control of cables in time of war. The Union Government also issued landing licences to cable companies, and in that way obtained a measure of control. Mr. Samuel had told them that in 10 years' time existing licences would be falling in, and uniformity in this respect could then be brought about and the necessary control secured throughout the Empire. He thought the Conference would be wise to hesitate a little before passing this resolution, in order to see in what directions wireless telegraphy developed.

Sir E. MORRIS said the hopes held out by Mr. Samuel with regard to the control of rates promised largely to lessen the objections to the present privately owned cables, and also to remove some of the reasons in favour of nationalisation. The matter must not be regarded entirely from the commercial aspect.

The POSTMASTER-GENERAL said the proposal which had been put forward invited the various Governments, partners in the Pacific Cable Board, to incur the expenditure of about £500,000 for cable alone. In view of the deficiency between the amount of work which the Pacific cable could directly give to an Atlantic cable and the full capacity of the cable, the question was whether the deficiency could be made up by increased business. If the business were increased by a large reduction of rates, the load might be made up, but it would not increase the revenue. There would be little possibility of attracting business to the State-owned cable in the United States and Canada, because the land-lines in those countries were in the hands of private companies connected with the American cable companies. According to an estimate which had been made such a cable would involve a total annual expenditure of over £50,000, against receipts estimated at £25,000. An independent estimate by the British Post Office officials placed the probable expenditure somewhat higher. The Governments concerned would not be asked to undertake that additional loss on the ground of efficiency, because the present service was worked with speed and accuracy. If it were argued that it should be done in order to cheapen cable rates, the argument would be a stronger one if no steps were being taken at present in that direction. But, in view of the probability of a reduction in rates, he suggested that the Governments would not be justified in undertaking the large capital expenditure and the risk of loss that would be involved. He suggested the following as an alternative resolution :—

"That in the event of considerable reductions in trans-Atlantic cable rates not being effected in the near future, it is desirable that the laying of a State-owned cable between England and Canada be considered by a subsidiary Conference."

The original resolutions were then both withdrawn, and Mr. Samuel's resolution unanimously adopted.

Wireless Telegraphy.

Sir JOSEPH WARD afterwards moved :—

"That the great importance of wireless telegraphy for social, commercial and defensive purposes renders it desirable that a scheme of wireless telegraphy approved at the Conference held at Melbourne in Dec., 1909, be extended as far as practicable throughout the Empire, with the ultimate object of establishing a chain of British State-owned wireless stations which in emergency will enable the Empire to be to a great extent independent of submarine cables."

He said wireless telegraphy had advanced considerably, and offered a great inducement to have a world-wide Empire system established. In New Zealand they were having two high-power stations erected, which would guarantee to carry 1,250 miles during the day and much further at night. In addition they would have four low-power stations, and all the ships in New Zealand waters would be equipped with wireless apparatus. It would be grand to have a girdle of wireless stations round the Empire, particularly in time of war, when the existing cables might be cut. The system might also be of advantage from the commercial point of view.

The POSTMASTER-GENERAL said that the Home Government considered it very desirable that a chain of wireless stations should be established throughout the Empire, partly for strategic and partly for commercial purposes. Such a system should be State-owned, and should be established speedily. It was not thought advisable to establish the system in every direction simultaneously at the outset. The Government proposed to start with a chain of six stations in England, Cyprus, Aden, Bombay, the Straits Settlements and Western Australia, and from there to be linked on to New Zealand. Later on South Africa would be connected viâ either East or West Africa, or even by both routes. If favourable terms could be arranged it might be desirable, in the first instance, for one of the wireless companies to erect the stations; but failing that, the Admiralty might undertake the work. In any case, the working of the system would be by the Post Office and the local administrations in India and the various Dominions. It was suggested that the United Kingdom should bear the cost of the stations in England, Cyprus and Aden; that India should bear the cost of the station at Bombay; that New Zealand and Australia should bear the cost of the stations in their respective territories; and that the cost of the station at Singapore, that station being created almost exclusively as a link in the chain, should be equitably divided. With regard to the proposals of the Melbourne Conference, he was advised that the cost of crossing the Pacific by a chain of stations would be very heavy, while the strategic value would be small and the commercial value negligible. Such a system could, in fact, hardly be the beginning of an Imperial chain of wireless stations, and he suggested to omit any reference to the Melbourne Conference and pass a resolution in general terms in favour of a system of Imperial wireless telegraphy.

Sir JOSEPH WARD agreed to substitute the following :—

"That the great importance of wireless telegraphy for social, commercial and defensive purposes renders it desirable that a chain of British State-owned wireless stations should be established within the Empire."

The Hon. G. F. M. PEARCE supported the resolution, and hoped the Pacific would not be lost sight of. Other European countries possessed colonies in the Pacific, and it was possible they would not throw away their opportunities. Moreover, a Western Australian station was being established, and now was the time for the subject to be considered if there was any idea of adapting their system to any new scheme.

Mr. L. HARCOURT, M.P. (Colonial Secretary), said the question of the Pacific would not be lost sight of by the Colonial Office in the ultimate development of the scheme.

Sir D. DE V. GRAAFF supported the scheme on behalf of South Africa, and said he was glad to hear that a high-power station would be placed at Aden. As soon as that station had been erected, the Union Government would be prepared to consider the advisability of erecting another high-power station to form a link.

In regard to the financial side of the proposal, the POSTMASTER-GENERAL said the capital expenditure on establishing the stations would be borne in the manner and in the proportions he had described, but, as the stations would be links in a chain, the scheme must be viewed as a whole. He suggested that the working expenses and the receipts be pooled, and any profit or loss divided in an equitable manner to be arranged.

Sir JOSEPH WARD thought it would be more satisfactory if Australia and New Zealand themselves carried out what they required for their local purposes and agreed to share with the other portions of the Empire the costs of Singapore as a link between the various parts. He supported the proposal generally, it being understood that they were not committing

Digitized by Google

themselves to the details, upon which they would later be consulted and upon which they would require their own experts to report.

The Hon. A. FISHER said Australia was in favour of a British linking-up by a wireless system. But the Commonwealth authorities had started their own scheme and intended to proceed with it. They must reserve to themselves the right to put up stations where and how they pleased. While supporting the proposed scheme for strategic, protective and commercial purposes, he wished to make it clear that they were not committing themselves upon the financial side.

The amended resolution was then approved.

EDINBURGH THEATRE FIRE.

The public inquiry into the recent fire at the Empire Theatre, Edinburgh, was held on Thursday last by Sheriff Maconochie and a jury.

Mr. G. M. Sinclair, stage manager of the theatre, gave a general description of the stage, means of exit, &c. The class of plant used by the deceased Lafayette (he said) was the same as that used generally by artists of the kind. It was customary for such artists to bring their own plant, and Lafayette brought a considerable quantity of scenery and electric fittings. He had a stage manager and an electrician of his own. The supply of electricity was given by the theatre company. In "The Lion's Bride" there was a curtain roof, so to speak, on the stage, and hanging below that canopy roof was a lantern. Holes had been bored in the lantern and covered with gelatine material, and inside there were seven coloured electric lamps. Electricity was supplied by means of a cable from the prompt side. There were a number of other electric light fittings on the stage. There were two sets of seven wax candles also. He was satisfied that the fire had nothing to do with any of the fittings on the stage. He had a little box of his own at the prompt side of the stage. On the night in question Lafayette had completed his act, and the tableau curtain had been lowered, when he heard shrieking. Lafayette's electrician ran out from the stage and let go the iron curtain. He (witness), seeing the danger of two perch-light men who would have been killed had the curtain struck them, arrested the descent of the curtain. The curtain would then be about 12 ft. down. The men escaped, and the curtain was then lowered further. The back doors on the stage must have been open, however, and the draught blew the tableau curtain underneath the fire-proof iron curtain, and stopped it about 2 ft. 6 in. from the floor. He could not see how the fire occurred. The lights on the stage went out very soon after the fire, but the lights in the auditorium did not go out for some time afterwards. All the hydrants and other appliances in the theatre were working satisfactorily. Lafayette's properties were marked "Fire-proof." Everything had been done in the way of fireproofing in the building that science could suggest. The men who were working the perch lights could not be situated anywhere else to be of use. The fire-proof curtain served its purpose. The theatre was not fitted with any special automatic arrangements in case of fire, except the fire alarms. Under Lafayette's arrangements everybody connected with the theatre had to leave the stage, and the stage left solely to his men, witness and the stage fire-men.

Mr. ADAM H. CAMPBELL, burgh engineer, said that on May 2 (a week before the fire) he made an inspection of the theatre for a report to the justices. He saw no reason for disagreeing with his predecessor in considering the arrangements satisfactory for licensing the theatre.

Mr. E. W. BUSSELL, who said he was in the habit of doing Lafayette's repair work and constructed the lantern which was used on the night in question, said the lantern was open at both ends and a good current of air could pass through it. It was covered with canvas, with holes made in it. The holes were covered with gelatine. Inside the lantern there were seven electric lamps. He was in the theatre at the prompt side in the dress at the time the fire broke out. He observed flame running along the communicating wire of the lantern. After giving the alarm, he came across the two midgets who were engaged in the performance, and he ran them off as quickly as possible. When he came back he saw that the flames were spreading rapidly among the scenery. So far as his work of supervision was concerned he found everything in order that evening. He did not think the fire had been caused by the lamps swinging against the gelatine cover.

SAMUEL LLOYD said he was in the theatre at the time of the outbreak. He first noticed an extraordinary light at the top of the lantern. He could not say what caused the light. It was customary to line lanterns with gelatine, and he thought the gelatine was the least likely to take fire.

EUGENE CAWOOD, electrician, said he supplied the cable for Mr. Lafayette's performance. From his experience of electricity the only thing he could think of as to how the fire originated, assuming that it occurred in connection with the lantern, was a faulty joint inside the lamp.

Mr. S. E. MERRICK, electrician to the Lafayette Co., said he had been using the lantern in question for some time previous to the night of the fire, and it worked quite satisfactorily. He considered the electric cable supplied was perfectly suitable.

Mr. FRANK A. NEWINGTON, electrical engineer to the city of Edinburgh, was asked to give his opinion as to what might have been the origin of the fire, and it might have been caused by the fusing of one or other of the wires in connection with the lantern.

Mr. C. B. FOUNTAINE, manager of the Empire Theatre, said when the outbreak occurred he ran round to the stage with the intention of having the iron curtain run down but on getting there he found that this had already been done. If the artistes had made immediately for the exits after the alarm was given there would have been no fatalities.

Other witnesses having been heard Sheriff MACONOCHIE summed up the evidence. He thought it right to raise the question as to whether there was celluloid used upon the lamp, but to his mind it was conclusively proved that there was not, and at all events they were bound to take it that there was not, because there was no evidence to the contrary. One gentleman who had experimented said gelatine did not flare up, but frizzled away. He thought the evidence distinctly came to this, that, for one reason or another, there was a fusing at the place where the flexible cord was attached to the lantern, or at some of the points inside the lantern, and that the india-rubber insulation caught fire, ran up the wire, and then dropped down on the inflammable material or touched the scene hung about it. Several experts had told them that the wire was sufficient to carry seven lamps of 8 c.p. They had also the testimony of fact, which was even better than the testimony of experts—the fact that the wire had borne the lantern for a number of times. The only suggestion was that if it was exposed to hard usage it was not a strong enough wire, but there was not a shred of evidence to entitle them to say that it was exposed to rough usage. If they took the view of the evidence, there was no doubt the verdict should be that the cable was sufficient, and that the precautions taken were proper. The only question was whether they were going to suggest any other precautions which the evidence might have suggested to them might be taken.

The jury, after consideration, returned a formal verdict, with the recommendation that in future the city authorities should exercise more care both in regard to the safe construction of theatres and more frequent examination of electric lights and water hydrants.

PARLIAMENTARY INTELLIGENCE.

TELEPHONE TRANSFER BILL.

On Monday, in the House of Commons, in Committee, on a resolution on which to found this Bill.

The Postmaster-General (Mr. H. L. SAMUEL) said the resolution and the Telephone Transfer Bill which would be founded on it would enable the accomplishment of the transfer to the State of the business of the National Telephone Co., a great corporation with £3,000,000 capital employing some 18,000 men and women and supplying for the use of the public about 500,000 telephones. That was the consummation of a policy which was decided upon in 1905 by the Government of that day. At that time the policy of transfer to the State of the whole telephone business of the country was sanctioned by Parliament. Mr. Samuel proceeded to make a brief statement of the events which led up to the present measure and of the development of the telephone in this country. In 1907, he said, the Post Office had agreed with the National Company that at the end of the company's licence (on Dec. 31, 1911) the Post Office would purchase the company's plant in London on certain terms. That agreement was discussed in the House of Commons and was approved. In 1901 an agreement was made on the same lines covering all the rest of the country, and it was that agreement which now came to be consummated. The substance of that agreement was that on Dec. 31 next, unless the Postmaster-General fixed a later date—and there was no intention of fixing a later date—when the business of the company came to an end, and when it legally could not carry on its business any longer, the Postmaster-General should purchase the plant, which included land and buildings, at its value *in situ*, no payment being made for goodwill, no payment being made for past or future profits, and no payment being made in respect of compulsory purchase. These were the provisions inserted, because the company's business existed solely by virtue of the licence held from the Postmaster-General, and if things were left to take their course the whole business would come to a sudden stop on Dec. 31, 1911. Therefore it was by no means inequitable that the plant should be purchased on what was generally known as "tramway terms." The Postmaster-General was, by the agreement, given the right to object to any portion of the plant on one of two grounds—either that it had not been provided according to agreed specification, or that it was unsuitable for the actual requirements of the Post Office system on Dec. 31 next. The precise interpretation of those words was now under consideration by the Court. Goodwill payments, however, under the agreement, had to be made in respect of private-wire service provided by the company, which was not provided by virtue of any licence of the Postmaster-General. Goodwill payment had to be made in respect of that equal to the profits of the last three years. Also there was the special case of Portsmouth and Brighton, where the company's licence under the Act of 1899 had to be extended till 1926; goodwill payments might be claimed in respect to that period. These extensions were because the municipalities of Brighton and Portsmouth had started systems of their own with licences terminable in 1926. The Act passed in 1899 provided that where municipal licences were extended, the licence of the company was also to be extended for an equal period, and that on the occasion of the purchase, goodwill payments would be required in respect of that period of extension. That applied only to these two cases. The value of the plant was to be ascertained by agreement, or, failing agreement, by the Railway and Canal Commission. That draft document was presented to the House by the then Postmaster-General, and was referred by the House to a Select Committee in 1905, who carefully investigated the whole question, heard evidence from the Post Office, the company and other parties, and ultimately presented to the House a report approving the agreement with some slight modifications, which were thereupon embodied in the agreement. The House acquiesced in the terms of the agreement. Recently preparations had been made between the com-

Digitized by Google

pany and the Post Office for carrying the agreement into effect, according to the letter and the spirit of its provisions. A joint inventory was proceeding, but there was, he regretted to say, little or indeed no prospect of an agreement being arrived at between the two parties as to the value to be attached to the plant. The divergence of view between the company and the Post Office was so great that no negotiations were likely to bridge the gulf, and it was fully anticipated that the matter would have to be referred, as provided in the agreement, to the Railway and Canal Commission to determine the precise amount of money to be paid for the plant on tramway terms.

Clause 1 of the bill, which he should introduce would authorise, the Treasury to borrow to pay the sum awarded by the Railway and Canal Commission as the amount due to the National Telephone Co. in accordance with the agreement. There would also be a provision in the bill relating to a sum which amounts to about £1,600,000 which was in the hands of the National Company, and which represented subscriptions paid in advance by telephone subscribers. That sum had been gradually accumulating from year to year, and had been invested by the company in its own business, and of course it had paid for part of the plant. That sum of £1,600,000 must be handed over by the company in cash to the Post Office on the occasion of the transfer, and it was proposed that the Post Office should do as the company had done—use the money as part of the capital invested in the business. The agreement required that one-fourth of the purchase money should be paid in cash by the Postmaster-General to the company, and that sum of £1,600,000 would be used as a set-off against the sum payable in cash to the company. The Post Office had had considerable experience for some years past in the management of the telephone through the development of its own system. When the trunk wires were bought from the company in 1896 they were purchased for £450,000. The Post Office had invested in the development of trunk wires an additional sum of nearly £5,000,000 and, although he was far from claiming that the trunk-wire system was by any means perfect, and he looked to a very large development, extension and quickening of it, still he thought there would be a general consensus of opinion that in the last few years it had shown considerable improvement. In the United States, it must be admitted that between some of the large cities there was a rapidity of service which had not yet been attained in the United Kingdom, but it should be remembered that the charge made for the use of the trunk-wire service in the United States varies between 250 and 300 per cent. more than the charge in this country. Another £5,000,000 had been spent by the Post Office on the remainder of the Post Office telephone system in London and the provinces, and they had now over 100,000 connected with the Post Office system. The number of telephones belonging both to the Post Office and to the company 10 years ago was 200,000. There were now 600,000, but that number was quite inadequate to the population of the country. They were providing for a very large development subsequent to the transfer. The Treasury was already empowered under existing statutes to spend another £2,000,000—that was to say, there were £2,000,000 of unexhausted borrowing powers remaining. In the bill he proposed to ask for power being given to the Treasury to raise an additional £4,000,000, over and above what was required to purchase the National Company's plant for future developments of the trunk service and the local service where it might be found that profitable extensions could be made. They had been very closely watching the development of the telephone system in the United States, and for many years representatives of his department had been visiting that country to acquire information. The head of the telephone branch of the Post Office had been in the United States, and the chief engineer had also made an exhaustive study of the telephone system there. The telephone traffic manager had only just returned. They had established a system of travelling scholarships for Post Office engineers which would enable them to go over to the United States for considerable periods in order to make a minute study of the telephone in that country. Representatives of the Post Office had recently visited Sweden, and they were contemplating visits by other officers to that country, where telephony was so widespread and provided at remarkably cheap rates. They were also going to experiment with automatic and semi-automatic exchanges. They recognised that that was a highly specialised business which could not be conducted on routine methods, and they were very much on their guard against the possibility that the future progress of telephony in England might be hampered by what might be called the dead hand of the State. The responsible officers in the district would be given a large measure of local control, and they meant to use to the full the experience and capacity of the company's staff in connection with work upon which they were experts. The company's managers would be kept at telephone work, and they would be given a large measure of discretion in their own sphere. It had been argued that the telephones ought to be transferred to a telephone authority instead of the Post Office, as a telephone authority would be less amenable to Parliamentary pressure. The loss on the telegraphs was due to several causes. To the low Press rates, to the extension of the telegraph system in the rural districts, to the introduction of sixpenny telegrams and to the development of the telephone itself. The bulk of telegrams used to be telegrams despatched short distances, but now the bulk were becoming, more and more, messages sent over long stretches of the country, and which were not of a remunerative character at the 6d. rate. When the average cost of dealing with the telegram now as compared with 20 years ago was considered, one found that a telegram dealt with now was a different thing from what it was 20 years ago, owing largely to the advent of telephony. He was being pressed to promise immediate reductions in telephone rates, and those who complained that the Post Office was not to be trusted to manage the telephones in a businesslike way because it was too much open to pressure were often themselves the first to bring political and other pressure to bear in order to secure an immediate reduction of rates which might be unremunerative. There was an objection to the request that the question of rates should be referred, prior to the transfer, to a Select Committee of the House of Commons in order that the existing rates might be examined and a new scale devised. They did not know what the cost of the telephone company's plant would be. It had to be determined by arbitration, by the Railway and Canal Commissioners. The capital cost of the plant would, of course, be a predominant factor in fixing the rates to be charged. In connection with that exceedingly extensive system, the capital investment was a most important factor in the balance-sheet, and it would be perfectly impossible at present (when the value of the plant was undetermined) to fix what should be charged for the use of that plant. If a Select Committee were appointed this session there would be no data to place before it on which it could act, and the Committee would have no course open but to report to the House that it was unable to consider what were the proper rates to be charged for the telephone service when it had no estimate of the capital value of the telephone system or of what ought to be charged year by year for interest. He proposed to leave the matter over until after the award of the Railway and Canal Commission. Subsequently an alteration of the existing rates would be necessary for two reasons. First, there was an inequality in the rates at present. Some had their service on the "flat" and others on the measured rate system. There were many cases where subscribers were receiving their service below cost price, and the continuation of that system must be either a loss, to be made good by the State when the service was taken over, or the user must be subsidised by the small user at an unduly high rate for his smaller service. I hope, therefore, that if unremunerative agreements were terminated the present measured rates might be greatly reduced. When the revision came the rates should be fixed in accordance with fixed principles, first of efficiency, speed and accuracy, and it would be a false policy to put the rates so low that a highly efficient service would be impossible. The second principle was that it was to the interest of the State and of the community to encourage a very wide user of the telephone by great numbers of small users. In the third place, the telephone service should pay its own way. Telephone users should have the use of their own subscriptions. He proposed that when the valuation was completed a revision of rates should be undertaken on those lines by the Post Office. He proposed also that if that revision was not generally acceptable it should then be submitted to a Committee of Inquiry for examination, which should be either a Select Committee of the House or a Committee consisting of representatives of the chief commercial bodies of the country, and of others who had great interest in the efficient conduct of the telephone service.

One or two suggestions had been made as alternatives to the transfer of the telephone system to the State. When that subject was discussed by the House in 1905 municipal telephones were then being advocated by many persons. In 1899 there was a considerable movement in favour of municipal telephony. He favoured the policy of municipal trading and the ownership of the telephones by municipalities where it could be shown that they could be suitably managed by local bodies. But after a careful study of the subject he had come to the conclusion that the management of the telephones was not really a suitable enterprise for a local body to conduct. In the first place, local service was more and more being connected with the trunk service, and in years to come the custom of communication between town and town would rapidly increase. If, however, the trunk service was in the hands of the Post Office, and the local telephone exchanges were under the local bodies in the towns, friction and difficulty were sure to occur in arriving at speedy communication between the different towns. The municipal area was not the natural telephone area, which was rather that which had a town for its centre with outlying suburbs and districts. Those areas frequently were not all comprised within the municipal area, and difficulties would consequently arise—they did arise when the municipalities were in the business—owing to questions of finance, the rates charged and wages paid. Next there were all the economies to be gained by management on a large scale. A Government department which had perhaps 600,000, or perhaps 1,000,000, telephone subscribers, could place its contracts to much greater advantage than municipalities that had but 10,000 or 20,000 subscribers each. A Government department had at its command also highly skilled and highly paid expert advice always engaged in watching developments, always experimenting, always bringing up possible improvements in the service. Municipalities could not go to the expense of having experts of that calibre. Again, a Government department could easily obtain capital for its needs and the advanced requirements most necessary in developing the service, while municipalities were not as well situated in this respect. Experience showed that telephony was not a very profitable sphere for municipal enterprise. He had offered to purchase the Portsmouth system on similar terms to those paid by the National Company, or, alternatively, to sell them the National Telephone Co.'s plant at Portsmouth. Neither offer had been accepted by the Corporation, and therefore there would be a competing system. He was still in communication with Hull Corporation. There was no demand from any quarter for a municipal telephone service except from some individuals and associations in Glasgow, but there was no official request from Glasgow Corporation itself. It might be assumed, therefore, that municipalisation as an alternative policy was now generally abandoned.

More recently suggestions had been made, supported by the London Chamber of Commerce, that a Telephone Authority should be created on the lines of the Port of London Authority, which should, without control by the House of Commons or a Government department, conduct

Digitized by Google

the whole telephone business. He was opposed to that suggestion on several grounds. One was that such an authority could not be fully representative without being too large to be workable. It would be necessary for the small users to be represented as well as the large, for the rural districts to be represented as well as the town districts; and he saw no prospect of any board being created that would represent all the various interests and districts entitled to representation. The House of Commons was the only sufficiently representative body to which to commit the ultimate control over so widespread and important a service as that of the national telephones. More important, perhaps, was the fact that the telephones were inextricably intertwined with the telegraphs, and it would be a most unbusinesslike and uneconomical proposition to endeavour to set up new lines of poles everywhere, to lay new underground cables, and to separate the buildings of the telephone system from the telegraph system. The alternative would be that the telephone authority should also be the telegraph authority. If that were so, it would mean taking over £1,000,000 a year loss on the telegraphs and the total break up of the whole organisation of the Post Office system. If the telephones were under one authority and the telegraphs under another it would result in so wasteful a system, a system giving rise to so much friction among the officials who had to deal with the two services, that it would become utterly impracticable in its working. Of all the various proposals made in regard to the telephone system this proposal of a separate telephone authority seemed to him to be by far the worst and most impracticable.

It was desirable and necessary that the company's employés should be taken over by the Post Office. Lord Stanley, in 1905, undertook that those employés of the company receiving less than £700 a year and having more than two years' service should be taken over, unless they had, unfortunately, an abnormal sick leave rate in any particular case. He proposed to redeem that promise and to extend it further, so as to take over the whole staff, no matter what their length of service might be. The pay they would receive would, in many cases, be greater than they were now receiving, and in no case would it be less, unless their rate of pay had been abnormally raised by the company in the last two years in view of or in connection with the transfer. The conditions in regard to leave and sick pay would also be considerably better than those provided by the company. The question of their seniority after they became members of the State system raised a good many difficulties which it would take some time to adjust, but in no case would their years of service with the company be left out of account in fixing the seniority of the transferred officers. The question of their classification in the various grades of Post Office employés was being investigated by a Departmental Committee. The pensionable servants in the company's employment would have two options: they might either take their share of the pension fund, put it in their pockets, and then come to the State and start afresh to qualify for pensions, the State adding two years' additional service in respect of their past service. Or, as probably they might regard as more advantageous, they might surrender to the Exchequer their share in the company's pension fund, and in exchange they would be given State pension rights attaching to the office to which they would be appointed as though the whole of their past service had been with the State and not with the company. Almost the whole of the pensionable staff of the company would be transferred to establishment posts in the Post Office, and therefore pensionable posts. They would receive a more liberal pension than was provided by the company. With regard to the other and larger class of servants of the company who were not subscribers to the pension fund, four times as many would be placed on the establishment as had hitherto been in the pensionable class in the company. These officers had desired that all their back pay service should count for pension service under the State. The cost of that had been calculated, and he found that it would involve what would be practically a bonus of £700,000 to those officers. There was only one case in which such a course had been taken, and that was when the original telegraph company was transferred to the State—a transaction which had since been recognised as having been carried out on most wasteful and extravagant lines, when vast sums of public money were given with both hands, and with the result that the telegraphs had been charged ever since with an excessive liability in respect of the transaction. There was no precedent for counting for pension purposes after transfer to the public authority service which was not regarded as pensionable by the previous employer. The matter was referred to the Select Committee which sat in 1905 to consider the purchase agreement, and after hearing evidence the Committee reported against that demand. However, they did not propose to stand upon the strict letter of justice. They proposed to give these officers not only better pay, better leave conditions, better conditions with regard to sick rates, and new pension rights, but, in addition, they proposed to add two years to their service with the State as a bonus to qualify for pension under the Civil Service. That was in accordance with the recommendations of the Select Committee. That bonus would be given not only to those who were pensionable under the company, but also to all those who were not pensionable under the company, and they were very much the larger number, including nearly the whole of the operating class, who would be pensionable when they were transferred to the State and came on the establishment as Civil servants.

Mr. AUSTEN CHAMBERLAIN said that if he had any complaint to make of the very business-like statement of the Postmaster-General it was that he did not tell the Committee a little more about his financial arrangements. He gathered from the resolution that, as regarded that portion of the purchase price of the company's plant which was not to be paid in cash, the bill would take power to raise the money by terminable annuities.

Mr. H. SAMUEL: Or Exchequer bonds.

Mr. AUSTEN CHAMBERLAIN said that he should have thought that, on the whole, terminable annuities were eminently the right financial weapon to deal with a transaction of that particular kind, for they would fix a date by which the capital liability would be extinguished. He was glad to learn from the speech of the Postmaster-General that some of the rather fierce controversies which raged round the two agreements were definitely closed, and that the Government which made those agreements had been justified alike by experience and by the verdict of their successors. He entirely agreed with what the right hon. gentleman had said about the municipalities and the telephone system. If the telephone system was to be worked by a public authority at all, and he agreed that it must be, it must be worked by a national authority. No other authority could deal with the whole country, reconcile all the interests that had to be reconciled, and make the system a thoroughly national system. He was not quite certain that, if they had a perfectly free hand to do as they pleased, it would not be wise for the House of Commons, even at that stage, to create a telephone authority national in character, acting under powers conferred by Parliament, but not subject to the same kind of perpetual pressure that every Postmaster-General was exposed to in that House. That, however, was not now a question of practical politics, and he desired to support the Postmaster-General in first creating an efficient public telephone service and then in maintaining it at the highest level of public utility. He differed from the right hon. gentleman when he said that the service was not to be worked for a profit. There were systems of public utility which must be worked even at a loss, but in his opinion the telephone service was not one of them. He did not want to dogmatise on the exact amount of profit, but thought that it might be taken at 5 per cent. on the capital outlay. Part should be devoted to the benefit of the taxpayer as a whole, at whose risk the work was being carried on. When the change came in the rates charged for the service, he hoped that he would bear in mind the case of the small user and would lower the minimum rather than the maximum charge. The only thing that he regretted in the absorption of the system by the State was the great addition it entailed in the number of State employés, which might prove a possible danger to public life. Whether they warded off that danger depended on the ability of the House to remember that it was the guardian of the interests of the nation, and that they must not be sacrificed to the interests of individuals, however well organised or clamorous they might be.

Mr. T. LOUGH, Mr. JOYNSON-HICKS, Mr. HELME, Mr. STUART-WORTLEY and Mr. PETO also took part in the discussion.

In reply, Mr. H. SAMUEL said the agreement between the Postmaster-General and the Telephone Company was that the payment of the purchase money should be made in the form of annuities. The company, however, had made representations since to the Treasury that those securities were not of a character readily marketable, and they would prefer to have the payment made in the form of Exchequer bonds. They were prepared to meet their views in that respect, the amount of money involved being very small, and accordingly powers were taken under the bill for the Treasury either to issue annuities or Exchequer bonds payable within a period of not more than 20 years. As regards the staff, he wished to make it clear that of course if a person had entered the service of the Telephone Company a week or a month before the transfer he would not be entitled to have the two years' service added. Many of the undertakings which had been given were of a character which it would be exceedingly difficult to put into the form of clauses, but, just as he was honouring the promises given by the present Lord Derby, and even going beyond them, he had no doubt that any successor of his would honour any undertaking he had given across the floor of the House. The officers of the company who were not placed on the establishment when they were transferred would receive a compensatory allowance. There would be no medical and no literary examination for the servants who were transferred. It was impossible to give any accurate forecast of how many years it would take before the full development of the system to which he looked forward could be secured. That must depend on the rates to be charged and the efficiency of the service, and the rates would depend on what they would have to pay the company. Therefore they had every reason to hope that the price would not be at all an excessive one, for the lower the price they had to pay to the company the more cheaply they would be able to supply a service to the subscribers, and the more rapid the telephone development would be.

The resolution was then agreed to.

GREATER LONDON RAILWAY BILL.

This Bill has been under consideration by a Select Committee of the House of Commons, and on Friday the Committee sanctioned the portion of the proposed line from Northolt to Victoria and Albert Docks, but disallowed other portions.

The CHAIRMAN (Sir J. Compton-Rickett) said the Committee were not satisfied with the promoters' case in regard to the cost of constructing the line, nor with regard to the anticipations of income. They could not believe the trade to and from the docks would continue to go down the Thames. They did not think it desirable that a large amount of trade should be carted through the congested streets of London to outside destinations, and considered that some such line should be constructed, because a large increase of trade immediately would tax the present means of communication to the point of congestion. The case of Tilbury did not appeal to the Committee so strongly as the case of the Victoria and Albert Docks. The Committee, therefore, disallowed the section of the line between Ilford and Tilbury. At the other end of the proposed line the Committee were not satisfied with the evidence as to north and south traffic or that the present means of communication were congested. They considered that Feltham was not a good place for a congeries of railways to the south, and that in the

Digitized by Google

trade anticipated the promoters would be disappointed. They disallowed the portion of the line between Feltham and Northholt. The Committee hoped that the Great Western and Greater London Cos. would find it mutually desirable to arrange a passenger service from Paddington to the north and west of London, and they hoped that the junction with the Great Northern would affect passenger arrangements between King's Cross and the City. The Committee would leave to the Greater London Railway optional rights to make junctions on condition that all junctions affecting main running lines should be flying junctions. The line should be made within a reasonable time, and the Committee hoped no extension of time would be granted in the future. There should be a limitation for substantial construction to the satisfaction of the Board of Trade in three years, and two-thirds of the capital should be raised in two years. The portion of the line sanctioned would extend from Northolt to the Victoria and Albert Docks.

RAILWAY SIGNALLING AND ACCIDENTS.

In the House of Commons on Friday, Mr. Wardle raised a discussion on the administration by the Board of Trade in reference to the number of hours worked by railway men, urging that instead of a standard of 12 hours per day there should be one of 10 hours. He said that the question of accidents on railways was still a serious one for the men concerned. The Board of Trade did not seem to realise what their powers were, or they were slow in carrying them out. On the whole of the railways there were only 10 inspectors. There was great need of further inspection.

Mr. J. H. THOMAS said that since 1907 there had been three or four serious railway accidents, and the Government inspectors who inquired into these disasters attributed them to the failure of the men to observe rule 55. While strict observance of the rule might have prevented those accidents, it was impossible, under modern conditions of railway life, to give effect to it because it was not only dangerous and obsolete, but absolutely impracticable. The rule made it compulsory on the part of either fireman or guard of a train immediately the train reached a signal-box to proceed to the signal-box in order to remind the signalman that they were there, so that the signalman should not permit another train to run into them. The Board of Trade ought to abolish the rule, and compel railway companies to adopt some of the many mechanical appliances now available.

In reply, Mr. S. BUXTON said that, while not wishing to minimise the importance of the question of accidents, he would point out that, especially in the last 10 years, there had been a substantial reduction in the number of fatal accidents. As to non-fatal accidents, the increase was not so great as had been represented, because a large number of small accidents formerly not recorded, were now brought into the return. The Board of Trade had not found that the staff of inspectors and sub-inspectors was insufficient to cope with the work. He had been in communication with the railway companies in regard to the rule which required that, if a train was detained, the guard or fireman should walk to the signal box and speak to the signalman, so as to make sure that he was aware of the position of the train. Having regard to the improvements there had been in telephonic and electric communication, the Board thought that danger might be avoided by the use of appliances, and wrote to the companies pointing this out. Many of the companies had done a great deal in the way of fitting these mechanical appliances, but others had not done as much as lay in their power. The suggestion had been made that the Board of Trade should compel railway companies to fit these appliances; but the Board had no power to do so, and he hoped that it would not be necessary for them to seek such power.

Electric Traction on Standard Railways.—Last week Mr. CHIOZZA MONEY asked the Prime Minister whether his attention had been directed to the fact that German producers already possessed the advantage of cheaper railway rates than were available here, that Germany was now entering upon a vigorous policy of railway electrification, that electrification would give, in addition to still lower railway rates, cheap supplies of light, heat and power for industrial and social purposes; and if, in view of the increasing handicap which British producers and traders would soon suffer in these respects, he could say whether the question of railway nationalisation was engaging the attention of His Majesty's Government.

Mr. ASQUITH, in a printed reply, said he understood that railway rates were to some extent lower in Germany than in this country, but it was difficult to make an effective comparison. Steps were, he believed, being taken to equip portions of the German railways for electric traction; but a cheap supply of electric power for other industries did not necessarily depend on the electrical equipment of railways. He was unable to promise legislation with a view to railway nationalisation.

Telegraph (Construction) Bill.—This Bill was read a second time in the House of Commons on Monday. In moving the second reading, the Postmaster-General (Mr. Herbert Samuel) said it was a purely departmental measure of no general public interest. It dealt with telegraph lines and cables crossing railways and canals, and relieved the Post Office from payment for their maintenance in cases where those services were not rendered.

London Electric Railways.—On the 1st prox. the London Electric Railway Co. will introduce season tickets on the Baker-street and Waterloo, the Great Northern and Piccadilly and Hampstead lines.

Tickets will be sold to cover all journeys where the ordinary fare is 2d. or over, and will be sold at half rates to children under 15 years of age, to students, apprentices and junior clerks up to the age of 18 years.

LEGAL INTELLIGENCE.

British Westinghouse Electric & Mfg. Co. (Ltd.) v. Electrical Co. (Ltd.)

On Saturday Mr. Justice Swinfen Eady delivered his considered judgment in this action, relating to an alleged infringement of letters patent No. 18,786 of 1902, for "Improvement in electric arc lamps," granted to Hugo Bremer.

Defendants denied infringement and disputed the validity of the patent.

Mr. Justice SWINFEN EADY, in giving judgment, said the validity of the patent had come into question in a former action between plaintiffs and one George Braulik, when the patent was upheld by the Court of Appeal. But the evidence in the present case was different, and the alleged infringement was a different lamp. The patentee stated in the specification that his invention related to electric arc lamps of the kind in which the electrodes were inclined to each other, and both pointed in the downward direction, the arc being formed at their lower extremities, and he claimed as his invention an arc lamp having downwardly pointing electrodes and provided with both downward and horizontal feed mechanism, so arranged that a certain amount of operation of the horizontal feed mechanism takes place before the downward feed mechanism is permitted to operate, subject, however, to the disclaiming note, which was as follows: "The lamps to which this, my invention, applies are of the type in which the current is supplied to the electrodes through electrode holders in which the upper end of the electrodes are firmly clipped, and which are capable of being lowered simultaneously through the same distance, and about one of which the corresponding electrode can swing under the action of a device acting near its lower end, and I limit my claim to lamps of this description." It was determined in the former action that there was no substance in the objection as to insufficiency of specification, that the letterpress was clear and intelligible, and when taken in connection with the figures rendered it perfectly easy to understand the invention, notwithstanding certain trifling inaccuracies in the drawing which were not of a kind to cause difficulties to any electrician. The exact nature and extent of the invention, as described in the specification and shown in the drawings, was considered in that action, and reading the claim with the text of the specification it was determined that the claim was limited to the invention so described, and the exact limits of the claim were pointed out. He was bound by the construction put upon the specification by the Court of Appeal in the former action. It was urged, however, that the language of the plea of insufficiency was different in the present case from that in the former, and that if the patentee intended a floating feed the language of his specification was very inappropriate for that purpose. But that point was covered by the previous decision. The floating feed involved a lamp being so adjusted as to meet the variations of current arising from the irregularities and the resistance due to the irregularities of the carbons. The mechanism shown and claimed in the specification was capable of instantaneously adjusting the electrodes so as to compensate for the irregularities in them, and thus keep the light steady. The mechanism which struck the arc was capable of alternately shortening and lengthening the arc as the variations of the electrodes required, and it was that improved mechanism which rendered the lamp capable of instantaneous response to changes of resistance in the arc. It was said that there was no evidence of utility in the present case, but the sale of the "Excello" lamp was proved by Mr. Marshall. That lamp was made substantially in accordance with plaintiffs' specification, and was the pattern being sold commercially at present, and the manufacturers had already paid royalty on nearly 20,000 lamps to the owners of the patent in question. It was urged that some lamp manufactured and put on the market by plaintiffs themselves proved a failure, but he had no evidence of what that lamp was. It was then contended that plaintiffs' patent failed for want of novelty, that the invention had been anticipated, or at all events, having regard to common knowledge, there was no subject matter. With regard to Graham's lamp, he was satisfied that he did not contemplate or intend, or describe any arrangement intended to obtain a floating feed. The action of his mechanism was what had been referred to as "sudden death" action. There was no indication in the specification of floating or of any advantage or benefit being gained by any horizontal movement of the carbon beyond striking the arc. The essence of his invention was his device for regulating by an electromagnet the escapement, so as to provide for the knife edge being alternately engaged with and released from the series of pins, and thus regulating the feed of the carbons. The patentee's mode of regulating the length of the arc was by regulating the downward feed, and not by obtaining any horizontal floating action. Although a model of Graham could be made so that it would float, there was, in his opinion, no indication of obtaining a floating feed in Graham's specification from beginning to end. Crosby is much further off floating than Graham, and might be dismissed, for the reason and upon the grounds set forth in the judgments of Lords Justices Moulton and Buckley in the previous case. Wright's patent was for a magazine electric arc lamp, the object being to provide a lamp with a series of carbons arranged in magazines, and also having a central main for automatically feeding the carbons one after the other as they were consumed. It seemed quite a hopeless lamp. Prof. S. P. Thompson said that if you made the lamp with magazines it would be a very bad lamp indeed or badly balanced. With regard to floating, the extreme positions of the electromagnetic mechanism would vary in accordance with the number of carbons in the magazine, and the points of equilibrium would vary also. It was urged that defendants really admitted that

Digitized by Google

Wright floated, but Mr. Swinburne's evidence amounted to this—that if the lamp did float the feed would become hopeless, because one carbon would go before the other, and that the only way to make the lamp work would be to arrange it so that there was no floating in the ordinary working, and that when it did feed it fed both carbons. Jamin was also referred to, but it seemed to have little if any bearing on the case, and the evidence about it was not elaborated. The carbons were not inclined but parallel while burning, and were only inclined to strike the arc.

The real contention of defendants was that the substance of plaintiffs patent was to be found in Graham, Crosby and Wright taken together and adding common knowledge. In his opinion that contention could not be supported. Plaintiffs' invention was for a lamp of a certain definite type, and was a distinct advance upon everything that had gone before; it had enabled flame arc lamps to come into general and commercial use; it had given to a definite type of lamp a floating horizontal feed in a definite manner and superior to anything which had gone before. The invention was new and useful, and subject matter for a valid patent. The infringement seemed clear. Defendants had in substance taken plaintiffs' lamp, although with variations; they pivoted the guides, with the result that there was a larger mass to be moved. But it could make no difference in principle whether one merely moved the electrode and its holder or whether one regarded the whole frame as being the electrode holder, pivot that, and then operate it as near the bottom as possible. Such a variation was covered by the doctrine of mechanical equivalents. The horizontal floating was obtained by a similar method in each case. The result was that plaintiffs succeeded, and were entitled to the relief claimed.

Mr. WALTER: I ask for an injunction, an enquiry as to damages and delivery up. I also ask for a certificate of the particulars of breaches, and also that the validity of the patent came into question.

His LORDSHIP granted the application and, by consent (if notice of appeal is set down within 14 days), the operation of the order, so far as the delivery up was concerned, was suspended until after the appeal has been disposed of, but no stay as to costs.

W. Canning & Co. v. Northern Flexible Metallic Tube Co.

On Monday and Tuesday Mr. Muir Mackenzie, official referee, heard this action to recover the balance of the price of an electric galvanising plant for galvanising iron strip. Defendants alleged that the plant was defective and counterclaimed for damages.

Mr. T. TERRELL, K.C., said the question to be decided was whether the plant supplied was efficient for its purpose. Plaintiffs contended that it was, and that if any defects did arise they were caused by want of skill on the part of defendants' employés. He explained that flexible tubing was produced by a process of coiling long iron strips or ribbons, a thin strip of rubber material fashioning the joints. It was necessary to protect the tubing, when made, from ravages of rust, and that was done by galvanising it or giving it a thin coating of zinc. In 1908 defendants were desirous of procuring a galvanising plant for galvanising their own strip, which hitherto they had not done. Plaintiffs agreed to supply the plant. Counsel explained the process of galvanising and said that the strips of steel wire passed through a tank containing a carefully prepared solution. An electric current passed from the anode in the tank through the solution to the steel strip which formed the cathode and deposited on the strip a coating of zinc. The electric energy was derived from a dynamo and the current used had to be carefully regulated. After plaintiffs had put down the plant in 1909 at a cost of £260, it was tested on Feb. 21 and described by defendants as "very satisfactory." In April they wrote still saying it was satisfactory but complaining that the zinc coating obtained was too dark, and asking plaintiffs' advice. Plaintiffs wrote asking for samples of the solution, &c., defendants were using but did not get them. Hearing no more, they rendered their final bill, but defendants refused to pay, contending that the plant was not satisfactory.

Mr. GEO. A. DARBY, electrician in plaintiffs' employ, gave evidence as to visiting Bradford to test the plant after it had been put down. Such plant needed careful watching to see that the electric current used was kept quite steady. He saw the plant while passing a quantity of steel strip through it. It did the work of galvanising very well, and defendant's representative expressed himself as quite satisfied with it. When he went down at a later stage, after the dispute had arisen over the settlement of the account, he found the plant in a very dirty and rusty condition. It was an eyesore compared with the condition the plant was in when plaintiffs handed it over. Changes had been made in the working of the plant which seemed to suggest that defendants had been trying to experiment with it. If the plant had been properly cleaned, put into working order and skilled men to attend to it, it would turn out perfectly galvanised steel strips.

Cross-examined by Mr. WAUGH, K.C., for the defendants, witness admitted that he had not worked similar plant to the one in question anywhere else. He was testing it for four and a-half days. It was necessary for the sawdust through which the steel strip passed for the purposes of drying, to be moved about to prevent that nearest the strip from becoming sodden. There was no mechanical device to do that on the plant in question. If there had been it would have been an improvement no doubt, but it would have put up the cost of the plant. The man attending the plant could have done that. If not properly dried by passing through the sawdust the strip would not be properly galvanised and rust would be produced. As to the suitability of the solution used in the electrolyte, he said the use of the hydrometer was not sufficient to test whether the solution had been made up properly.

Mr. H. RILEY, electrician in plaintiffs' employ, said that in testing the plant of this character it was necessary to find out the best current density required. He helped last witness to test the plant in question.

Mr. WM. S. RAWSON, consulting electrical engineer, said he had examined the plant and was of opinion that with proper supervision it ought to work satisfactorily. He did not think that the zincing would take on a dark colour in the electrolytic tank. He had seen the zincing come out porous when the current had been excessive. There was a switchboard and a resistance, and from the switchboard the operator would from time to time regulate the strength of current sent through the electrolyte.

Cross-examined, witness said, given reasonable supervision, a two hours' test was sufficient to see whether the electrical portion of the plant would work properly. He denied that the strip would show a black appearance in the electrolytic bath unless the current density was reduced to a very small minimum indeed. With the exception of rust on the original strip it would not become dark by reason of inefficient cleaning in the processes through which it passed. If the speed at which the steel tape was passed through the plant were increased it would be reasonable to increase the electric current density in order to maintain a uniform zinc coating on the strip. He agreed that the effect of hydrochloric acid on zinc would be to dissolve the zinc. It would not be a proper method to line boxes where hydrochloric acid was washed off the steel tape, with zinc. He should not have used zinc. If the current was maintained at a proper average he could not account for the strip coming out dark in places and subsequently rusting. Even if the swillers were not properly acting and the felt wipers did not take away all the caustic solution or acid, it was difficult to say whether they might not cause part of the strip to be darker in colour than others.

Mr. GEORGE ARTHUR POPE, works manager of plaintiffs, stated that he was associated with the design of the apparatus in question. The general principle of the design could not be followed in the case of defendants' plant because of want of space.

Mr. WM. E. HUGHES said plaintiffs gave him samples of steel strip galvanised and not galvanised for testing. Witness had been asked to find out what would be the quickest time and lowest current used in which to produce a deposit similar to that on the galvanised sample sent to him. With the aid of Sir Wm. Preece's process he had found that by using one-tenth of an ampere on a foot length of ¼ in. strip for a period of 10 or 15 minutes he obtained the deposit of zinc desired. He examined the plant in question on Feb. 8, 1911, at Bradford. It was in a filthy condition. He thought that if the plant had been properly worked under efficient supervision the results would have been satisfactory.

In cross-examination he said from what he saw the dynamo was quite sufficient for the purposes of supplying current, the electrolyte was satisfactory and the pickling tank and swills were suitable. Too much or too little electric current would make the zinc deposit on the steel tape darker, certainly too much time would.

Hearing adjourned till Monday.

National Telephone Co. (Ltd.) v. Postmaster-General.

The Court of Appeal (the Master of the Rolls and Lords Justices Farwell and Kennedy) continued the hearing of the cross appeals in this case.

Sir ALFRED CRIPPS, for the company, submitted that sub-clause *a* of clause 3 of the specification applied to both competitive and non-competitive areas. It was most important to bear in mind that as regards *a* the test was whether the plant was of the prescribed construction or specified in the list in the schedule to the agreement of Feb. 2, 1905. No objection could be taken to plant in the list, even if it was not constructed according to specification. Then by *b*, in competitive areas, what was taken out of *a* was plant, whether constructed according to specification or not, if it was not suitable to the Postmaster-General's system at a particular date. As for land and buildings, land was not to be bought and buildings were not to be constructed after 1905 without the consent of the Postmaster-General, but in competitive areas the assent did not protect the company if the buildings were not suitable. It could, of course, be contended that certain buildings were not suitable to the business that the Postmaster-General proposed to carry on. It was admitted that plant in the list could not be objected to under *a* All. that *b* provided was that construction according to the specification was no longer a protection to the company. That did not give the Postmaster-General the right to object to plant in the list as unsuitable to his requirements. The test of suitability was suitability to the system of the Post Office on a particular day. That excluded suitability to the Company's system. Suitability, therefore, had to be considered with reference to that limited test, and if in these circumstances it were construed as meaning necessity, the result would be absurd, because no portion of the company's plant could be said to be necessary to the Post Office. With regard to the notices, it must be remembered that the onus was on the company to obtain an award before a certain date that plant objected to was suitable. The notice, therefore, ought to be such that a reasonable business man on receiving it could decide whether it should be accepted or not having regard to his business interests. He contended that if a piece of plant was suitable for the requirements of the Post Office on Dec. 31, 1911, it did not become unsuitable merely on the ground of redundancy. If the test of the Post Office requirements was, what plant was required on that day, both services would be working on that day and it could not be said that plant which was actually in use was not required. With regard to notices, the Postmaster-General had obtained for himself the advantage that he could give notices of objection. That, however, did not entitle him to put on the company the burden, which might be extremely onerous, of finding out what was included in the

Digitized by Google

notice. It was for the person who gave the notice to make plain what he was objecting to. It was no answer to say that the matters were so complicated that it would be impossible for the Postmaster-General to do that. The more complicated the matter, the more necessary was it that the notice should be such that a reasonable man of business could act on it. If it was impossible to give such a notice, then it was impossible to give a valid notice at all. There were a large number of matters in respect of which a valid notice could be given, but there was no reason for holding valid a notice on which no reasonable man of business could decide whether he should accept or contest the notice.

On Tuesday the Attorney-General having concluded his reply on behalf of the P.M.G., their lordships reserved judgment until June 28th.

Potts v. Metropolitan District Railway Co.

At Westminster (London) County Court on Friday, before Judge Woodfall and a jury, Wm. Potts sued defendant company for damages for personal injuries alleged to have been sustained through his having received an electric shock while standing on the platform at Putney Bridge station.

Mr. NIMMO (for plaintiff) said that on Dec. 8 last his client went to Putney Bridge station to catch a train to Southfields. There had been a heavy fall of rain shortly before, and on the platform there was a small puddle of water. Plaintiff walked to within 2½ ft. or 3 ft. of the edge of the platform, and was standing in the puddle when he suddenly received an electric shock of so severe a character that it precipitated him on to the permanent way. As a result he sustained serious injury. The explanation of plaintiff's unpleasant experience was that the heavy rainfall had caused the tape or covering of the electric cable to become so saturated that the current leaked from the "live" rail and passed through the girder and concrete, which formed the platform, to the water—a natural conductor—in which plaintiff was standing.

After hearing plaintiff's evidence,

Mr. A. E. COOPER, engineer to the defendant company, said he examined the cable after plaintiff had received the alleged shock, and found not the slightest trace of there having been a leakage. Had there been a leakage the current would have gone nowhere, except to earth, and the fact that plaintiff stood in water on the platform rendered him in no way liable to receive a shock. It was possible that if plaintiff from some unexplained cause fell off the platform on to the "live" rail he might have received a slight electric shock.

His HONOUR said the allegation that there must have been a leakage of electric current had not been satisfactorily proved, but even if there had been, the expert evidence was distinctly against the current having travelled to the station platform. Going further and presuming that plaintiff did receive an electric shock in the way he alleged, could it be said that the railway company had been guilty of negligence, seeing that the leakage was described as resulting from a sudden heavy downpour of rain?

The jury, after a few minutes' deliberation, found for plaintiff, awarding him £50 damages, and judgment was entered for that amount, with costs.

Belfast Corporation v. Cavehill & Whitewell Tramway Co.

A Divisional Court of the King's Bench Division, Dublin, delivered judgment last week in this application by the Corporation to set aside the award of Mr. Macassey, arbitrator appointed to settle the amount of the purchase money to be paid by plaintiffs for the company's undertaking.

The CHIEF BARON, in delivering judgment, said the question was, first, what was the basis upon which the award was made? And, secondly, was that the true basis? He had arrived at a clear conclusion that the basis upon which it was made appeared upon its face. He had come to the conclusion that the award was made upon a wrong basis, and consequently that there was jurisdiction in the Court to set it aside. The statement in the award was that the arbitrator had valued the undertaking as a going concern, ascertained as a revenue-producing undertaking, and that on such construction he was bound to assess the value on the basis of capitalising the revenue which the transferred undertaking was capable of producing. He considered he was precluded from having regard to any circumstances other than the circumstances of a maintainable revenue which the undertaking was capable of producing and the number of years' purchase to be taken for ascertaining the capitalised revenue. He declared that he had not adopted the construction contended for by counsel for the Corporation, and that in arriving at the value, which he fixed at £56,155, he had had regard not merely to the circumstances of the maintainable revenue which the transferred undertaking was capable of producing and the proper number of years' purchase, but to all the circumstances of the case to which he could properly have regard, assuming the construction contended for by the Corporation was not the true construction. Therefore if that was the true construction of the agreement he had acted on a wrong basis. The true mode of arriving at its value, in the opinion of the Court, was first by ascertaining what was its net annual value, what could be made out of the thing to be rented and then by capitalising the rental value of the undertaking. He was not to be taken as laying it down that it was the amount of rent that could be obtained if let, because the profit that could be made by a tenant would be part of the profits that would be made by the company or Corporation, and that element of profit was an element that would be taken into consideration. The arbitrator would be bound to take into consideration the reasonable probability, having regard to all the circumstances of the case, of the actual profit in previous years either being increased or diminished or continued, and in that way he might arrive at an average sum which would fairly represent what would be the average income for a number of years, and then capitalising and putting upon it such a number of years' purchase as he thought ought to be given in the circumstances. Accordingly the Court held that the award should be remitted back to the arbitrator, and they would extend the time for making tha award to Nov. 1 next. They would give no costs.

Arbitration as to Laying Power Mains.

At Batley last week Mr. W. H. Patchell sat as Board of Trade arbitrator to hear an appeal by the Yorkshire Electric Power Co. against the refusal of Batley Corporation to give consent to the laying of electric mains in Bradford-road in connection with the Company's scheme for the extension of their cables from Dewsbury to Gomersal.

Mr. W. B. WOODHOUSE, engineer and manager of the company, stated that the mains were intended, primarily, to serve one mill in Soothill, and he quoted from the company's Acts to show that they had power to supply energy and lay mains in Batley.

The Town Clerk (Mr. J. H. CRAIK) pointed out that it was specially provided that the company should not lay mains except with the consent in writing of the Corporation.

Mr. WOODHOUSE stated that in the Soothill Upper area the company had power to supply without consent, that power being preserved in the amalgamation order, so that both the company and the Corporation had power, in competition, to supply. The company had made an agreement with the owners of the Union Mills to supply energy, and he contended that the company's supply was more suitable than the Corporation's. He asserted that the Corporation's supply on the borders of Soothill was not satisfactory.

Mr. CRAIK contended that an alternative route for the company's main was practicable, and that Bradford-road was so full of tramways, gas and water mains, electric mains and sewers, that there was not room for any more.

Evidence was called on this point, and after Mr. Woodhouse had replied, asserting that the alternative route would be a mile longer than the one proposed, the inquiry closed.

Rail-less Trolley Traction.—The official opening of the Leeds and Bradford rail-less trolley routes took place on Tuesday, and subsequently those who took part in the proceedings lunched together at the Town Hall, Leeds.

There were about 200 guests at the luncheon: The Lord Mayor of Leeds (Mr. Wm. Middlebrook, M.P.) presided, and amongst others present were the Lord Mayor of Bradford (Mr. J. Moser), Sir Wm. Clegg (Sheffield), Mr. E. Priestley (chairman of Bradford Tramways Committee), Ald. C. F. Tetley (chairman of Leeds Tramways and Electricity Committee), Ald. Smithson, the Town Clerks of Leeds and Bradford (Mr. R. E. Fox and Mr. F. Stevens), Mr. J. B. Hamilton (Leeds city tramways manager) and Mr. C. J. Spencer (Bradford city tramways manager).

Sir WILLIAM CLEGG, chairman of the Sheffield Tramways Committee, proposed "Success to Rail-less Trolley Traction." He offered to Leeds and Bradford his hearty congratulations on being pioneers of this new system of traction. He believed that their venture would be most successful, but whether they would be as profitable as ordinary tramways he was a little doubtful. He was certain that the advantages of the rail-less system would outweigh any financial difficulties that might present themselves.

Ald. C. F. TETLEY responded to the toast. He regretted, however, that they had had to go to such distant countries to find the latest developments in traction, at a time when the enterprise in England was in some directions as great as ever, and when capital and mechanical skill were not less. Referring to the extraordinary development in electric traction during the past 20 years, he remarked that the first trolley system was started in America in 1888, and three years later the British Thomson-Houston Co. started a trial line from Sheepscar to Roundhay, in Leeds. From those small beginnings had grown the splendid success of municipal tramways, and he could not imagine that anyone who saw the traction of 1891 realised what the next 20 years would bring about. He hoped that complete success would attend the new system, and that its advantages would be fully appreciated. However, he was glad to think that they had joined with Bradford in being the pioneers of that great movement.

Mr. E. PRIESTLEY also responded. They were inaugurating what he believed would be a very successful means of traction. He believed that both Leeds and Bradford would go forward to success in the working of the system, which, as had been pointed out, had very material advantages for special routes. One advantage which had not been mentioned was that if the service on any particular route proved unprofitable the equipment could easily be moved to another. He believed that the example of Leeds and Bradford would be speedily followed by other towns.

The equipment of the route along Sticker-lane, Bradford, awaits the inspection of the Board of Trade, and a public service cannot be started until that inspection has been made. It is proposed as a start to run a half-hourly service with two cars, one of which has still to be completed. Later other cars may be added and the service reduced to 20 minutes, or even less. The cars are single deckers, constructed to hold 28 passengers, and they are driven by two motors, each of 20 H.P. They run smoothly on wheels with solid rubber tyres, and if necessary they can be steered to the extreme edge of the road. The fare of the single journey has been fixed at a penny.

COMMERCIAL AND INDUSTRIAL SECTION.

MUNICIPAL, FOREIGN & GENERAL NOTES.

BRITISH NOTES.

Application for Extension of Patent.—The Automatic Telephone Co. are applying to the High Court for extension of the period of the patent No. 809/1898, for "Improvements in calling devices for telephone exchanges. Application will be made on or after July 29 to the Court for a time to be fixed for the hearing of the petition.

Bethnal Green (London).—The Council have decided to appoint a consulting engineer, at a fee of not more than 50 guineas, to report upon a municipal scheme for the distribution of electricity in the district, energy being taken in bulk from a neighbouring Council.

Birmingham.—The Tramways Committee are in negotiation with the City of Birmingham Tramways Co. for the acquisition of the company's undertaking in Aston, Yardley, King's Norton and other districts in the Greater Birmingham area.

Ewell.—Epsom Council have applied for an order to enable them to give a supply of electricity to certain premises in this district.

Glasgow.—At a special meeting of the Corporation last week the Tramways Committee recommended that the application of the motormen and conductors for a 48-hour week (instead of 54) and 14 days holiday with pay (instead of 5) be not entertained.

It was also recommended that the department continue to arrange the duties and reliefs of motormen and conductors so that the average time actually spent on the car would be as near as possible eight hours per day; that after the day's work of motormen and conductors be, as far as practicable, divided into two shifts, and that the number of long shifts be kept at a minimum. The committee further recommended that during the first, second, third and fourth six months the rates of pay remain as at present, these being respectively 4s., 4s. 2d., 4s. 4d. and 4s. 6d., but that in the third year they be increased in the fifth six months of service from 4s. 8d. to 4s. 10d., in the sixth six months from 4s. 10d. to 5s., in the fourth year from 5s. to 5s. 2d., in the fifth year from 5s. 2d. to 5s. 4d. and thereafter from 5s. 4d. to 5s. 6d.; conductors with over five years' service who have not qualified as motormen to be raised from 5s. to 5s. 2d. The extra cost to the department in wages would be about £5,500, and this sum, added to the recommendation for increases already adopted by the committee, would make the total net increase £9,000.

Hastings.—The Council have applied for sanction to a loan of £[illegible] for mains extensions.

Menai Bridge.—The Council have entered into an agreement with W. E. Berry for the erection of electricity works for public and private lighting.

Merthyr.—The Council have appointed a committee to consider the question of approaching the Merthyr Electric Traction & Lighting Co. with a view to ascertaining whether they were disposed to sell to the Corporation the whole of their undertaking within and adjacent to the borough. The committee is also to report upon the advisability of applying for powers to construct an electric tramway or other mode of conveyance along the main road between Merthyr and Treharris.

Nantwich.—The Rural Council have granted permission for the Council to lay mains in the district so as to supply current to the new County Training College and the new Postal Sorting Office.

Southampton.—The salary of the station engineer (Mr. J. B. B. Hewitt) has been increased to £215 per annum.

Stockton-on-Tees.—An unopposed inquiry was held here on Tuesday last into the application of the Council for sanction to borrow £6,750 for additional plant at the electricity works.

Theft of Electric Cable.—At Dublin City Commission last week two men named Meyne and Kavanagh were found guilty of stealing 11 yards of electric cable from the Technical Schools. The cable was being used in connection with the electric lighting installation for a new building. Each prisoner was sentenced to six months' imprisonment.

Weaverham.—The Rural Council have consented to overhead wires being used by a private company to supply current at Weaverham, Acton and Acton Bridge. The scheme will be carried out by Mr. A. J. Leigh, Northwich.

Wombwell.—The Council will apply for a provisional electric supply order, the area to include Darfield. An order is also being applied for by the Electrical Distribution of Yorkshire.

COLONIAL AND FOREIGN NOTES.

Australasia.—The Agent-General for New South Wales (123-5, Cannon-street, London, E.C.) will receive communications for a N.S.W. firm who wish to get into touch with a British maker of machinery for manufacturing ordinary and brazed mild steel unscrewed electric conduits.

Wanganui East (N.Z.) ratepayers have passed a resolution to raise a loan for tramway construction.

The Ruthning Electrical Co. propose to erect electricity works at Murwillumbah (N.S.W.), a town of 2,000 inhabitants, about 400 miles north of Sydney. The local Council have referred the matter to a sub-committee.

Mr. Woodford, civil engineer of the Public Works Department, has completed taking levels for a scheme for utilising the water power of the Shoalhaven river (N.S.W.) for the generation of electrical energy. The river, which comes within 20 miles of the city of Goulburn, rises 3,000 ft. above the sea level. It is proposed to conduct the water 24 miles in flumes and pipes from Devil's Bridge to a power house at Tanner's Gully.

Newcastle (N.S.W.) Council are strongly in favour of the electrification of the present steam tramways in the town. At a recent meeting they decided to ask the Minister for Works to construct another electric tramway. Mr. J. E. Donaghue has withdrawn his offer to act as consulting engineer to the Council's electricity department at 50 guineas per annum, as in view of the large amount of work involved his fee would be 100 guineas for the first and 50 guineas for subsequent years.

Mr. F. W. Clements calls attention to the fact that Adelaide Council have power under the Adelaide Electric Supply Co.'s Private Act to acquire the company's undertaking in 10 years, whereas the usual term in the other Australian States is 30 years, and in the case of English undertakings 42 years. He considers the Corporation are not justified in their threat to demand, through Parliamentary intervention, "more liberal terms" than they already have as to the acquisition of the company's undertaking.

The net profit on the Wellington (N.Z.) electric tramways last year was £6,225, and on the supply undertaking £4,346.

Austria-Hungary.—The Aussig Communal authorities will commence the construction of the Aussig-Pokau railway to Tellnitz station in the coming autumn. The expenditure will include about £14,500 for the construction of the line, £7,500 for a turbine and £5,800 for a storage battery.

The Zivnostenska Bank is interested in a project to erect iron-works (in which electrical energy generated by water power will be used) to work the rich iron deposits in Eisenstein (Bohmerwald).

Belgium.—An engineer at Brussels wishes to receive communications from British manufacturers desirous of supplying goods to the Belgian Government Departments, particularly for the telegraph and telephone services. Further particulars from Mr. T. E. Jeffes, British Vice-Consul, Brussels.

Canada.—The Imperial Trade Correspondent at Winnipeg (Mr. J. Appleton) says, in reference to the contract for the erection of a dam, power station, &c., at La Colle Falls, on the North Saskatchewan river, British firms could not tender, but there will be an opening for electrical machinery.

India.—"Indian Engineering" understands that consideration of the scheme for a system of electric lighting and electric fans for the general offices and press buildings of the Assam-Bengal Railway at Chittagong has been deferred because the initial cost is considered prohibitive.

"Indian Industries and Power" states that Marshall & Co. (Bombay) will illuminate the Bombay public buildings electrically on the occasion of the visit of the King and Queen in December next. The Bombay Electric Supply Corpn. will have available for this purpose and for private illuminations 2,200 kw. of plant. The devices on the public buildings will comprise about 200,000 5 c.p. carbon filament lamps.

Sweden.—The Bill dealing with the lease of State waterfalls to private persons has been passed, the maximum period for leases being 75 years instead of 95 as originally proposed. Leases may be cancelled by the Government if the holders use the water power for purposes other than those specified.

ELECTRICITY SUPPLY AND TRAMWAY ACCOUNTS.

Colchester.—The income of the electricity supply department for the year ended March 31 was £16,248, against £15,146 in 1909-10.

Receipts from the sale of electricity to private consumers were £12,261 nett (952,153 units), against £10,990 (802,564 units); public

Digitized by Google

lighting revenue was £968, against £959, and tramway revenue £2,699, against £2,948. Total costs were £8,949, against £8,410, and after paying interest (£2,351) and repayment of loans (£3,189), writing off £999 from prepayment installations and mechanical stokers account, and providing £385 for purchase of arc lamps for hire and £162 for purchase of meters, there was a net profit of £212, against £414. The capital expended is £36,430, an increase of £3,381. The maximum load was 1,050 kw., against 895 kw., and the load factor 16·11 per cent., against 17·5. The equivalent of 61,164 8 c.p. lamps is connected, against 56,191, and 1,483,458 units were sold, against 1,372,340. The works costs were 1·23d. (1·23d.) and the total costs 1·44d. (1·47d.) per unit.

Manchester.—The accounts of the electricity department were submitted to the Corporation last week.

The total capital expenditure was £2,733,207, an increase of £54,577 over 1909-10, but the net loan debt is £1,949,583. The revenue from the sale of current was £396,145 (including £118,223 from the tramways department, £870 from street lighting and £13,599 from private lighting, power and heating supplies to Corporation departments) and meter and motor rental, &c., brought the total revenue to £403,327. The total working expenses were £189,027, and included £108,349 cost of generation, £31,710 distribution, £34,947 rents, rates and taxes and £11,814 management expenses. The gross profit was £214,300, and after paying interest (£69,682), sinking fund (£89,543) and instalment of loan repaid to Public Works Loan Commissioners (£6,370), and placing £21,672 to renewals suspense account, there was a net profit of £27,573, out of which £15,000 was paid to rate account and the balance placed to special renewals account; 115,400,446 units were generated (against 95,542,254) and 83,308,848 were sold (against 42,886,223), including 54,718,320 to private consumers, 167,001 for public lamps and 28,423,527 to tramways department. The total maximum supply demanded was 28,240 kw. lighting and power and 9,310 kw. for traction. At the Dickinson-street and Bloom-street stations the first completed year of working with the large Tudor storage battery results in a very substantial reduction of the station costs.

South Shields.—The accounts of the electricity supply department at March 31 show capital expenditure £188,173.

The revenue from electricity supply was £26,307, an increase of £1,236; the working expenses were £13,185, a decrease of £245, and the gross profit was £13,122, an increase of £1,481. Interest and sinking fund came to £11,707, a decrease of £49, leaving a net profit of £1,415, making, with the profit on the quay of £19, a total surplus of £1,434, compared with a deficit of £209. £59,499 of the capital expended (over 31 per cent.) has been contributed by means of the sinking fund. The maximum load was 2,054 kw., against 1,760 kw., and the combined load factor was 19·32 per cent., against 20·53 per cent. The lamps and motors connected increased from the equivalent of 133,703 to 143,817 35-watt lamps, and the number of premises connected was 1,574, an increase of 100. 3,476,539 units were sold, an increase of 310,243. The lighting units increased by 1·5 and the power units by 7·4 per cent.; but there was a decrease of 14·4 per cent. in the traction units. The works costs were 0·57d., against 0·63d. per unit sold, and the total costs 1·66d., against 1·85d.

Sunderland.—The capital expended on the electricity supply undertaking at March 31 was £431,737, an increase of £7,281 over 1909-10.

Revenue from the sale of electricity was £53,568 (including £14,299 from the tramways and other Corporation departments and £2,566 from public lighting), and after adding meter rent (£671), public lamp maintenance (£988), &c., the total income was £55,485. The working expenses were £23,997, leaving a gross profit of £31,488. After taking into account the balance brought forward (£1,077) and paying interest (£12,403), sinking fund (£16,055) and £1,685 for condensing plant, pipework, switchgear, &c., there was a net balance of £112; 10,208,493 units were sold (6,850,966 for power and 1,206,431 for private lighting) 1,702,872 for traction and 448,224 for public lamps. The maximum supply demanded was 5,235 kw.

In his report, the borough electrical engineer (Mr. A. S. Blackman) states that the outstanding features of the year were the recovery in the shipbuilding and engineering trades from the great depression, the further reduction in generating costs (0·42d. to 0·37d. per unit) and the reduction in the average price from 1·5d. to 1·3d. per unit. The net profit of £1,189 on the year's working was made possible by the reduction in the coal consumption (from 4·35 lb. to 3·7 lb.). The power sales increased by 58·2 per cent. (from 3,961,302 units to 6,041,559) and the increase over the whole sales was 30 per cent. There are 1,256 consumers, an increase of 19; the equivalent of 94,377 32-watt lamps is connected for private lighting (an increase of 2,070) and 72,189 (3,097·8 H.P.) for power (an increase of 3,001 (123·6 H.P.). There are 215 arc and 355 incandescent lamps for street lighting, an increase of 263 incandescents.

West Bromwich.—The total revenue of the electricity supply department for the year ended March was £14,226, including £3,642 for private lighting, £8,547 net for power, £4,757 for traction and £380 for public lighting.

The total expenditure was £7,650, leaving a gross profit of £6,354 on the electricity supply and £222 on the hiring department. Interest and dividends on stock absorbed £1,734 and sinking fund £3,069, leaving a net profit of £1,782. 323,158 units were supplied for private lighting, 1,319,727 for power ,627,714 for traction and 100,974 units for public lighting.

TRADE NOTES AND NOTICES.

TENDERS INVITED

ALDERSHOT Urban District Council invite tenders for supply and erection at their electricity works of one 135 kw. Diesel direct-coupled set. Specifications and further particulars from the engineer, Mr. F. Garside, Electricity Works, Laburnum-road, Aldershot. Tenders to the Clerk to the Council, Mr. W. E. Foster, by noon July 4. See also an advertisement.

Tenders are invited for the supply of 150 miles insulated wire and 5 miles of telegraph cable to the Postmaster-General's Department in Victoria. Tender forms and specifications from the Commonwealth Office, 72, Victoria-street, London, S.W. See also an advertisement.

HAMMERSMITH (London) Borough Council invite tenders for supply of about 600 time switches suitable for controlling individual electric lamps for lighting side streets. The switches are required to deal with 1 ampere at a pressure of 120 volts single-phase a.c. 50 periods. Samples of switches tendered for should be addressed to the borough electrical engineer, Mr. G. G. Bell, 85, Fulham Palace-road, Hammersmith, W. Tenders to the town clerk, Mr. H. Thompson, by 4 p.m. Friday, June 30.

The Electricity Committee of HULL Corporation invite tenders for one year's supply of electric cables and for the supply of the two water-tube boilers required in connection with the extensions of plant at their Sculcoates-lane generating works. Tenders, addressed to the Chairman of the Electricity Committee, Town Hall, Hull, must be delivered by noon of Monday, June 26.

Tenders are invited for supply of lead-covered and vulcanised rubber-covered cable to the City of MELBOURNE. Specifications, &c., from the agents for the City Council, Messrs. McIlwraith, McEacharn & Co. Proprietory (Ltd.), Billiter-square-buildings, London, E.C., to whom tenders by noon Friday, July 7.

The Secretary of H.M. OFFICE OF WORKS invites tenders for providing and erecting at the South Kensington generating station complete surface-condensing plant, capable of dealing with 15,000 lb. of steam per hour, together with the necessary gantry and stanchions. Forms of tender and further information may be obtained at H.M. Office of Works, Engineering Division, 55, Whitehall, London, S.W., Tenders by 11 a.m., June 30, to Secretary, Storey's Gate, London, S.W.

GOVAN Corporation require tenders by June 27 for supply and erection of steam, exhaust and water piping, boiler, mechanical stoker, coal bunkers, and cooling tower and for extension of h.t. switchboard. Specifications, &c., from the Burgh Electrical Engineer.

BATTERSEA (London) Council require tenders by 4 p.m. June 30 for the supply of about 440 street lanterns for containing groups of metallic filament lamps. Specifications, &c., from the Borough Electrical Engineer.

The Great Southern & Western Railway Co., Kingsbridge Terminus, DUBLIN, require tenders by 10 a.m. July 5 for one year's supply of stores and materials, including electric light carbons, copper, iron, steel, oils, &c. Forms of tender from the Stores, Inchicore, Dublin.

SWINFORD (co. Mayo) Electric Lighting Committee invite tenders for the electric lighting of the town. Specifications from the Clerk to Swinford Rural Council, to whom tenders by 11 a.m. July 10 The requirements include suction gas plant, engines and dynamos storage battery switchboard, overhead lines and street lamps.

Mr. A. C. Freeman, 499, Sauchiehall-street, Glasgow, will receive tenders until 10:30 a.m. June 28 for carrying out an electric illumination and decorative lighting scheme for the Scottish Exhibition GLASGOW, 1911. Plans, &c., from the Chief Engineer's Department at the Exhibition.

MANCHESTER Electricity Committee invite tenders for supply and erection of two water-tube boilers, superheaters, coal chute ash conveyors and fuel economisers. Tenders to Chairman Committee, Town Hall, Manchester, by 27th inst.

IPSWICH Guardians require tenders by noon June 30 for alterations to switchboards and other electrical apparatus at the workhouse. Specifications, &c., from Mr. H. P. Girling, the Wharf Maldon, Essex.

CHARLEVILLE Electric Co. (Charleville, co. Cork) want tenders by noon June 30 for supply of suction gas plant, gas engine and electric generators, storage battery and accessories, switchgear, overhead lines and street lamp fittings. Plans, &c., from the Secretary.

Digitized by Google

CARDIFF Corporation require tenders by 10 a.m. July 14 for the supply of economisers and induced draught installation and supply and laying of cables. Forms of tender from Mr. A. Ellis, The Hayes, Cardiff.

HESTON and ISLEWORTH Education Committee require tenders by 10 a.m. July 5 for electric lighting of schools in district. Specifications from Mr. C. E. Ryecroft, Electricity Works, Hounslow.

LONDONDERRY Corporation require tenders by mid-day July 7 for wiring, fittings, lamps, switchboards, connections, &c., for the electric lighting of the new Guildhall.

ROTHERHAM Corporation want tenders by July 8 for 12 months' supply of single vulcanised bitumen covered cable and electricity meters. Particulars from the Borough Electrical Engineer.

BIRMINGHAM Electric Supply Department require tenders by June 26 for 12 months' supply of electrical accessories, engineering and general stores, &c. Particulars from the City Electrical Engineer.

LONDON County Council require tenders by 11 a.m. July 4 for four electric traversers for car-sheds. Specification, &c., from the Clerk.

IPSWICH Guardians want tenders by noon June 30 for alterations of switchboard and other electrical plant at the workhouse.

The Metropolitan Water and Sewerage Board, Albert-street, BRISBANE, Queensland, want tenders by noon Jan. 30 next for supply and erection, of one, two or three complete units, each consisting of power generating plant and pump or pumps to lift not less than 6,000,000 gallons per day. Particulars from the Secretary.

Tenders are invited up to July 19 for the supply of insulators, telephones, copper and iron wire to the Postmaster-General's Department in QUEENSLAND, and up to July 25 for the supply of 12 sections of a branching multiple magneto lamp signalling switchboard, &c., or one automatic or semi-automatic switchboard, &c., to the Postmaster-General's Department, VICTORIA. Tender forms, &c., from 72, Victoria-street, London, S.W.

MORTLAKE (Victoria) Butter & Cheese Factory Co. require tenders by noon Aug. 14 for supply of dynamo and booster, storage batteries and accessories, switchboard, cables, &c. Specifications from Messrs. F. A. McCarty & Co., 31, Queen-street, Melbourne.

The Town Clerk, WANGANUI, N.Z., will receive tenders until July 12 for supply of generating plant, gas-producing plant and battery and booster for the Corporation tramways. Specification can be seen at 73, Basinghall-street, London, E.C. Local representation is necessary.

WELLINGTON (N.Z.) Corporation require tenders by 4 p.m. Aug. 24 for supply of a motor power waggon and accessories for the electric tramways department. Gonville and Castlecliff Tramway Board, Ridgway-street, WANGANUI (N.Z.) require tenders by 4 p.m. Aug. 14 for supply of overhead tramway material, feeders, &c. Conditions, &c., can be seen at 73, Basinghall-street, London, E.C. Representation in New Zealand is necessary.

NAPLES Municipal Authorities require tenders by July 9 for supply and installation of the following plant in connection with the supply of electric power to Naples from the river Volturno:

1. Tubing and accessories for harnessing the water at rate of 7,000 litres a second and for the fall of 190 meters; upset price 702,900 lire (£28,116.)
2. Machinery and apparatus for hydro-electric power station, transmission line (about 57 miles), and transforming station; upset price [illegible] lire (£30,000.)

Tenders to Presidente del Consiglio Generale dell' Ente Autonomo Volturno, Naples.

Manufacturers who are prepared to supply 600 km. (372 miles) copper wire 5 mm. dia. are invited to communicate with the Direzione dell' Ente Autonomo Volturno, Naples, who after two months from April 10 will send invitations to tender to firms whom they consider suitable.

Conditions of tender, &c. (in Italian) may be seen at 73, Basinghall-street, London, E.C.

Tenders will be received at the Royal Arsenals, SPEZIA and NAPLES until 11 a.m. July 11, for supply of incandescent electric lamps and brackets (total about £1,260). Conditions (in Italian) at 73, Basinghall-street, London, E.C. Local representation necessary.

The "Gaceta de Madrid" announces that tenders will be received up to noon July 4, at the Sección Colonial del Ministerio de Estado, Madrid, for the complete installation of a wireless telegraph station on the island of Fernando Po, for the purpose of carrying on telegraphic communications in the Gulf of Guinea. The cost is estimated at 92,150 pesetas (about £2,300) excluding excavation and foundation work. This call for tenders is reserved to Spanish firms, but should no award be made, a second adjudication will take place to which foreign firms will be admitted. In this latter event Spanish firms will be allowed a preferential margin not exceeding 10 per cent. over foreign estimates.

The Prussian State Railways Administration, HAMBURG, will receive tenders on July 4 for supply of two electric motors, four pumps, travelling crane, &c.

TENDERS RECEIVED AND ACCEPTED.

Orders have recently been placed by the Bengal Nagpur Railway Co. with the Edison & Swan United Electric Light Co. and Dorman & Smith for electric light fittings, the Brush Co. for a motor frame and switch pillar, the Lancashire Dynamo & Motor Co. for a motor frame and control gear, and Siemens Bros. Dynamo Works for electric wire.

The Hart Accumulator Co. have a large order for train lighting cells and acids for the East Indian Railway Co. to whom J. Stone & Co. are also supplying a complete train lighting equipment.

Carlisle Council have accepted the tender of the Premier Accumulator Co. for the supply of a new lighting battery, booster balancing set and switchgear at £1,755, and for the maintenance of the battery for 10 years at £77 per annum.

Nelson Council have accepted the tender of the Tudor Accumulator Co. for replating the storage battery, for its maintenance for 10 years, and also for the supply of a booster balancer and switchgear.

Ashton-under-Lyne Corporation have accepted the tender of the Bastian Meter Co. for supply of meters (10 ampere) for the ensuing year.

Hornsey Council have placed an order with Babcock & Wilcox for the supply of a water-tube boiler, automatic stoker, &c. Two other tenders were sent in.

Hornsey Council have also accepted the tender of the Beck Flame Lamp (Ltd.) for the supply and erection of flame arc lamps. Twelve firms submitted tenders.

Southampton Council have placed an order with Cole, Marchent & Morley for an air pump at £262.

Stoke-on-Trent Guardians have accepted the tender for the National Telephone Co. for a fire alarm system at £130.

Dunmow Guardians have accepted the tender of Mr. Archer for telephones at £14. 10s.

Commonwealth Contracts.—The Australian Postmaster-General's Department has accepted the following tenders —

Victoria.—Western Electric Co., 200 attendants' telephone sets (25s. each) and outside distributing wire; Noyes Bros., g.i. wire; International Electric Co., J. Bartram & Son and India Rubber, Gutta Percha & Telegraph Works Co., telegraph and telephone apparatus and material.

South Australia.—British Insulated & Helsby Cables, British General Electric Co., Siemens Bros. Dynamo Works, India Rubber, Gutta Percha & Telegraph Works Co., Western Electric Co., J. Bartram & Son, Lawrence & Hanson Electrical Co., T. Zwesker & Co., Geo. Wills & Co., Rabone, Feez & Co. and British & Foreign Indent Co., telegraph and telephone apparatus and material.

BUSINESS NOTICES.

In future the address of the National Electric Construction Co. (Ltd.) and its subsidiary companies will be 3, Laurence Pountney hill, Cannon-street, E.C. Telephone numbers are 5329 and 5330 Bank.

The partnership between S. A. Sillem, F. A. Donnison and Wm. Sillem (trading as the Phœnix Electric Co.), 17, Morwell-street, Tottenham Court-road, London, W., has been dissolved. Debts by Sidney D. Cox, who will carry on the business under the old style.

Patents Development.—The proprietor of patent No. 21,959/1908, relating to "Process and apparatus for producing oxides of nitrogen by means of a rotary flame," desires to enter into arrangements for exploiting same in this country. Applications to Messrs. Wheatley & Mackenzie, Chartered Patent Agents, 40, Chancery-lane, London, W.C.

The owner of patent No. 16,183/1908, for "Improvements in or relating to telephony and telegraphy," desires to negotiate for the granting of licences thereunder. Particulars from Messrs. Lloyd Wise & Co., chartered patent agents and consulting engineers, 46, Lincoln's Inn Fields, London, W.C.

"The Journal."—Part 207 of the "Journal" of the Institution of Electrical Engineers is now ready, price 5s. Particulars of the contents are given in an advertisement.

"Who's Who in Science."—Messrs. J. & A. Churchill announce that they have in preparation a new annual with this title, to be edited by Mr. H. H. Stephenson.

BANKRUPTCIES, LIQUIDATIONS, &c.

A receiving order has been made against Emanuel Ristori, civil engineer, 54, Parliament-street, London, S.W. First meeting of creditors June 30 at Bankruptcy-buildings, London, W.C. Public examination Aug. 15.

A receiving order has been made against Edwd. Jas. Crosier (trading as Crosier, Stephens & Co.), engineer, 2, Collingwood-street, Newcastle-on-Tyne.

Digitized by Google

A receiving order has been made against Wm. Tulley (trading as Wm. Tully & Co.), mica merchant, 16, Water-lane, London, E.C. First meeting of creditors July 5 at Bankruptcy buildings, London, W.C. Public examination Aug. 15.

At the London Bankruptcy Court on Friday the public examination took place of Emil Laurence Oppermann, electrical engineer, &c., late of 74, Wool Exchange, E.C.

The liabilities were £2,425, assets £12. Debtor stated he was engaged abroad as an engineer prior to 1905. He then returned to England and became engaged in a syndicate in connection with a storage battery, which he sold in July, 1905, to the "X" Electric Accumulator Co. (Ltd.) for £3,158 in cash and £26,500 in shares, a large number of which were allotted to other persons. He acted as managing director of the company at £500 a year, until it failed in 1908. The "X" Synd. (Ltd.) was next formed to take over the business, and he acted as its managing director at the same salary until it went into compulsory liquidation in October, 1909. Since then he had been engaged in an unsuccessful attempt to promote a company to take over some rubber concessions in Sumatra. He had also lost money on other ventures.

On Friday Mr. Registrar Brougham suspended for three years the discharge of C. E. Marrian and H. E. Wells, merchants, 23, Ropemaker-street, London, E.C. (trading as Marrian, Wells & Co.).

It appeared that applicants closed their business in August, 1908, giving their creditors as security for their claims shares in the British Photo Lexigraph Co. (Ltd.), which they had formed for taking over an option to work an electrical advertising appliance. Owing to the refusal of London County Council to grant a licence to work the appliance in London, the company did not start business, and went into liquidation last February.

The trustee in the bankruptcy of Charlotte Rix (trading as Bridgwater & Wright), electrical engineer, 78, York-road, King's Cross, London, N., has been released.

A meeting to receive an account of the winding up of Neville Kaye & Co. (Ltd.) will be held on July 21 at the offices of Mr. J. H. Dixon, 11, Ironmonger-lane, London, E.C.

COMPANIES' MEETINGS AND REPORTS.

British Electric Traction Co. (Ltd.)

The fifteenth ordinary general meeting was held on Thursday last week, Sir CHARLES RIVERS WILSON, G.C.M.G., C.B., in the Chair.

The SECRETARY (Mr. Charles H. Dade, F.C.I.S.) read the notice convening the meeting and the report of the auditors.

The CHAIRMAN then said: I have presided at all the annual meetings of this Company, but this is the last occasion on which I shall do so as chairman of the company. It was 16 years ago that this company entered upon its career, with a view of affording a public service which at that time was little known in this country. Electric traction by the overhead system had been fully established in America for 10 years previously, and to a lesser extent on the Continent of Europe; but so little was known of the overhead system of electric tramways here that a good deal of the work of the company in the early years was devoted to removing the objections raised by local authorities and others to the adoption of the overhead system. To-day practically every tramway in this country is worked electrically, and, with the exception of London County Council tramways (which are mainly on the conduit system), and one or two undertakings in the provinces, all electrical tramways are worked on the overhead system. History shows that it is mainly the result of the work which this company did in educating public opinion that local authorities and others were able to adopt electrical tramways. During our existence I have been sometimes sanguine and sometimes depressed, but a gratifying feature of all our proceedings has been the constant sympathy which the shareholders have extended to the directors, and which has helped and encouraged us in the task of meeting and overcoming many difficulties. We found that at first we were able to make more or less satisfactory agreements with some local authorities, but it was not long before each local authority began to endeavour to get out of us a little more than the last one had got. The difficulties with the local authorities to which I have referred were of a varying character, and there were several exceptions. Middlesex County Council is one of the exceptions, and has demonstrated clearly the wisdom of making a statesmanlike and businesslike arrangement between the interests of the community and just treatment of a company, as compared with the folly of killing the goose that lays the golden eggs.

I have no desire to dwell unduly on the difficulties we have encountered, but in this the last statement I shall make to you as chairman of the company I wish clearly to emphasise the real cause of our troubles. I may appear to insist too much, as I have often before insisted, on the prejudice caused to our company by the action of local authorities. I have no wish to impute undue blame to those authorities, who have no doubt been actuated by a sincere desire to serve the interests of those whom they represent. If I am rightly informed, many of the smaller authorities are to-day experiencing the same troubles as ourselves from more or less the same causes. I wish to repeat what I said last year, that it is proved by the official returns of the Board of Trade that we are operating more economically and more profitably than other electrical enterprises in this country of the same class, and, I may add, at least as efficiently. The main reason why we are not now paying larger dividends is that the considerable investments which we have in the associated companies are not adequately remunerative. The average return on all our investments (over £5,000,000) is only 2·7 per cent., and as we are paying 5 per cent. on our first debentures and 4½ per cent. on the seconds, the balance is inadequate to meet the claims of the shareholders. I could offer you many reasons in explanation of this result.

Dealing with the report and accounts before you, we are able to point to an improvement in the position of the associated companies during the past year. The companies in which we are interested have earned something like £100,000 more than during the previous year, but they have become cautious in their adversity, and have put larger amounts to reserve, and only in a few instances have made small increases in the dividends. The conditions of trade appear to be better, and the weather conditions have so far also been favourable. It is reasonable to hope, therefore, that the result for the current year will be still further improved. We have effected a large reduction in sundry debtors and debit balances, from £447,947 to £247,997. We have taken debentures and shares in payment for the debts, each case being considered from a business point of view, and so the investments show an increased yield during the past year. Investments have increased from just under £5,000,000 to £5,240,000, and the average return on the larger volume of investment was greater than the average return on the smaller volume of investment in the preceding year. We have adopted the policy of realising our Consols. The average price in the books is £98. 3s. 8d. per cent., and the directors have definitely come to the conclusion that it is better to face the loss due to the realisation of these Consols and to invest the proceeds in other securities yielding a larger return. It is not easy to find in this country investments for capital to yield an industrial return, and we have great difficulty at the present time in profitably employing our surplus cash resources, because we are determined not to extend the business of electrical enterprise in this country unless and until we can secure better treatment and better prospects of making an industrial profit than is the case at present. There is, however, no difficulty in earning a little more than is obtainable from Consols. We have again purchased our second debenture stock to the extent of £36,134, and £6,408 of our first debenture stock, and have cancelled it. We were able to buy at prices much below their nominal value, and the difference, representing £12,393, has again been added to reserve. Our debenture stock has since gone up in price and the inducement to purchase is not now so great.

I have now to refer to the question of dealing with the arrears of dividend upon the preference shares, and to the reserve funds in relation to depreciation of assets. The last annual report stated that the directors proposed for the immediate future to deal with the depreciation as and when its amount is ascertained, and so long as such depreciation continues to transfer to reserve any profits or losses, other than accrued dividends or interest, made by the realisation of the then investments. With regard to arrears of preference dividend we have under consideration a scheme of re-adjustment of capital which we will submit at an early date. I may say at once that the directors do not think it is practicable or expedient, even if practicable, to propose any reduction of capital. What they will propose is a re-arrangement. Difficult as the problem is, the directors do not despair of being able to put before you an equitable scheme.

It is not without regret that I have made up my mind to retire from the position I have occupied for a good many years, and to resign that position into other and more vigorous hands. I assisted at the birth of this company, and I watched over the successes of its youth and the disappointments of a later period, but I believe now that the clouds are passing by, and that I may look forward with confidence to a successful future for the company under the able administration of Mr. Garcke. You know Mr. Garcke, and you know the work he has done for this company, but none who have not been behind the scenes can adequately understand what he has done; the labour, the industry, the enormous ability which he has brought to bear on the interests of the company. I wish to thank my colleagues on the board, Mr. Morse, our solicitor, Mr. Dade, our secretary, and Mr. Walmsley, our accountant, who form amongst them a staff second to none amongst industrial companies. I now move the adoption of the report and accounts, and the declaration of the dividends set out therein.

Mr. EMILE GARCKE, M.I.E.E., seconded, and expressed regret at Sir Charles Rivers Wilson's retirement. They were all very glad he had agreed to remain a member of the board.

Mr. SOAMES, after reviewing the company's position in regard to the item of loans, said: Sir Charles had touched on the policy of selling Consols and investing the money in other securities bearing a higher rate of interest. In view of the fact that they were paying 5 per cent. and 4 per cent. on their debentures, it would be better if they were to go on redeeming these debentures rather than investing in India 2½ per cent or Australia 3½ per cent.

A long discussion followed on several subjects relating to the account of the company; to the appointment of a shareholders' director, and committee of shareholders to confer with the directors; as to the adequacy of the reserves and the market value of the shares of which the reserve are composed; to the heavy task imposed upon Mr. Garcke on his taking the position of chairman as well as managing director of the company and other matters. After this discussion,

Mr. SOAMES moved:—"That a committee of shareholders be appointed by the present meeting to confer with the board as to the position of the company and on matters generally."

Digitized by Google

The CHAIRMAN said: It is open to you to carry such a motion, but it will prove to us very embarrassing and very detrimental to the company. We propose at an early date to call you together again in special assembly to consider the scheme we shall have to lay before you, and then no doubt will be the moment for us to call you into council, either by way of a committee or otherwise, to thrash out the very important proposals which we shall lay before you—proposals which will have a great effect upon the future of the company. These are my reasons for deprecating the appointment of a committee.

Mr. GARCKE, after replying in some detail to the points raised in the discussion, said: I have consulted my colleagues, and they are perfectly ready to give the assurance that any future appointment of directors shall be subject to confirmation by the shareholders. With regard to the committee, I do not know whether it is for investigation or for conference, but what I say is, do not be carried away by eloquent speeches delivered on the spur of the moment without due consideration. Realise seriously the responsibility that you are incurring in disturbing the ordinary course of business. Either you have confidence in the board or you have not. If you have not confidence in us, then I do not want to be here; but if you have confidence in the board I appeal to you not to increase our difficulties and add to our embarrasments. I say that your proper course is to wait and see what the directors have to propose to you before you say, "Let us have a committee."

The CHAIRMAN: I will ask you first to pass the accounts.

The resolution approving the report and the declaration of the dividends was put and carried. On the motion for the re-election of the retiring directors, Mr. J. S. Raworth was re-elected, but Sir C. W. Fremantle was outvoted, and a poll was demanded by the chairman. After the re-appointment of the retiring auditors (Messrs. Deloitte, Pender, Griffiths & Co., and Messrs. F. W. Smith & Co.), Mr. Soames's resolution was put and carried. A poll was demanded, and the two polls were taken together, with the result following:—For the appointment of a committee, 2,982; against, 6,047. Majority against, 3,065. For the re-election of Sir Chas. Fremantle as a director, 6,047; against, 2,832. Majority for re-election, 3,215.

We are informed that these figures do not include the proxies given to the directors by shareholders who were not present at the meeting.

Aron Electricity Meter (Ltd.)

The fourteenth annual general meeting of this company was held on Tuesday, Mr. H. HIRST presiding.

The SECRETARY (Mr. M. Aron, F.C.I.S.) read the notice calling the meeting and the auditors' report.

The CHAIRMAN then said: The report and balance-sheet as presented to you show the healthy development and progress of our business. In comparing this year's report with last, I would refer, first, to the interesting item of gross profit on trading, £44,000. This is nearly £9,000 in advance of last year, and nearly every country has contributed to this result. The amount received from dividends on investments is reduced, as the expansion of our business drained our liquid reserves previous to our debenture issue. We had to realise these reserves during the year, I regret to say, at a loss, but no blame attaches to your directors for this. I refer to this not only on account of the items on the debit side of the account (£78. 6s. 5d. and £85), but more on account of the fact that we have had on a previous occasion to write trust securities down by between £700 and £800. Management charges are, of course, increased, but not in equal proportion to the increased business. On the credit side we have increased stock and outstanding accounts; but the increase is normal in proportion to the increase of business. The large amount of cash at our disposal is, of course, the residue of the recent debenture issue.

We are at last in a position to pay a dividend to the ordinary shareholders, and I personally thank them for the patience they have shown. I think the outlook is such that they may enjoy continued participation in our prosperity. I hope you approve of our recommendation to put £5000 to reserve and use £7,000 of this year's profits in writing off a portion of the costs of the debenture issue. As regards the business itself, the increased output, due to increased sales, has strengthened our power to compete in the world's markets; our organisation, thanks to the supervision and hard work of Prof. Aron, is being more and more perfected every year, and the loyalty and interest in the business of our staff is an asset of which we are proud. Concerning the taximeter business, we are pressed with the ever-increasing number of instruments placed on the streets. We have hitherto used the total revenue from this branch for the purpose of writing down the expenses and cost of the instruments which we have put out, and none of the revenue has so far been used in arriving at the figure which we record as our trading profit (cheers). By this conservative policy we hope to create a valuable annual contribution towards the dividends which we hope to pay. I now move the adoption of the report and accounts.

Sir JAMES PENDER, Bart., seconded the motion, and after a brief discussion the motion was unanimously agreed to.

A motion approving the declaration of dividend on the preference shares and of 6 per cent. on the ordinary shares for the period to March 31 last was carried.

The re-election of Col. R. E. Crompton and Mr. S. Barclay Heward as directors followed, and the auditors (Messrs. Price, Waterhouse & Co.) were re-appointed. A hearty vote of thanks to the Chairman and to Dr. Aron brought the proceedings to a close.

DIESEL ENGINE CO. (LTD.)—At the meeting on Friday the chairman (Mr. C. C. Ellis) said that there was an increase in expenses of about £1,000, almost entirely due to increase in staff to cope with new business. Owing to the number of contracts in hand at the end of the year they had carried forward £5,000 for completion of those, against £2,500 last year. The demand for their marine engines was likely to be large, as the possibility of superseding steam seemed greater almost every day. They were building an engine of 150 B.H.P. for a fishing vessel, and it should be ready in August. They hoped that it would be the forerunner of considerable business. Total orders carried forward from last year amount to about 7,200 B.H.P., or more than double that of the previous year. Trade seemed to be improving, and they were now getting as many orders as they could execute.

GLOBE TELEGRAPH & TRUST CO. (LTD.)—The report of the directors for the year to May 31 states that the net revenue for the year, after deduction of expenses, amounts to £211,858. 14s. 8d., and makes, with £27,681. 5s. forward, £239,539. 19s. 8d. From this has been distributed £131,085. 10s. 6d. in interim dividends, leaving an available balance of £108,454. 9s. 2d. The directors now recommend payment of the following final dividends: 3s. per share (less tax) on the preference shares (making 6 per cent., less tax, for the year) and 6s. per share net on the ordinary shares (making 6 per cent. net for the year). These dividends will absorb £79,922. 5s. 10d. and leave £28,532. 3s. 4d. to be carried forward.

MARCONI WIRELESS TELEGRAPH CO. OF NEW YORK.—The report for the year ended Jan. 31 states that, allowing for the usual depreciation (10 per cent.) on station and experimental work, the balance shows that the company is rather more than self-supporting, but fierce and undue competition have precluded it from obtaining as many orders as in the previous year. During the year the company sent and received 2,291 messages, containing 34,130 words more in 1910 than it did in 1909, and the money gain was about $4,000. Sale of apparatus did not show up as well, owing to competition and price-cutting, whereby a living profit was hardly left to contractors. Expenses of business remained generally about the same. Over $11,000 was written off as depreciation. The loss of $1,700 shown in general working was caused by the opening and running of stations on the east coast, south of New York, which stations will eventually be most useful and probably paying, in connection with coastwise boats that the company are gradually acquiring as part of the Marconi equipped fleet. The aim is to control the whole of this business in the same way that the system operates the trans-Atlantic liners. The outstanding capital stock has been reduced from $6,190,000 to $1,547,500 The number of commercial ship stations owned and controlled by the company and by the allied Marconi Companies is constantly increasing, and there are now 469 steamships trading to America and various ports of the world fitted with the Marconi system; nine pleasure yachts are also fitted and have working arrangements by which the shore stations communicate with, send and take messages to and from 68 commercial vessels fitted or operated by companies with which this company has commercial dealings. Since the last meeting four stations have been erected and equipped on the east coast of America south of New York: Cape May, N.J.; Virginia Beach, Va.; Fernandina and Palm Beach, Fla. (working arrangements are in existence whereby the company uses the Government station at Key West); and is about to put up a station intermediate and between Virginia Beach and Fernandina, so that with the established stations north of New York a vessel sailing from Maine to Florida can be in communication the whole time. The Wellman airship, which started from Atlantic City to cross the Atlantic, was fitted with Marconi apparatus. Successful work has also been done in connection with submarines.

Experiments recently conducted in England look to the acceleration of plant life by electrical treatment. It is stated that by such treatment small fruits can be brought to maturity weeks earlier, and the production of vegetables and large fruits can be much increased. If so, a new field opens for wireless.

While the s.s. "Prinzess Irene" was ashore a few weeks ago the operator thereon sent and received over 10,000 words. In May, 1910, the trans-Atlantic wireless circuit, Glace Bay, Nova Scotia, to Clifden, Ireland, was opened for the use of the Canadian public, and in August of the same year the use of trans-Atlantic wireless was also offered to the American public. The strength of the Marconi system has been greatly added to this year by a decisive judgment obtained in the High Court of England in the action brought by Marconi's Wireless Telegraph Co. against the British Radio-Telegraph and Telephone Co., wherein the judge held that defendant company had been infringing the Marconi patent. Defendant company did not appeal and undertook to dismantle its stations and cease infringing. In the United States the company holds a patent (granted in 1904) almost identical with the above as to specifications and claims, and steps are now being taken to prove and sustain the said patent by actions at law against manufacturers and users, and it is the intention of the company to carry such actions on to a final issue with the least possible delay.

VICTORIA FALLS & TRANSVAAL POWER CO. (LTD.)—At the meeting on Monday the Marquess of Winchester dealt with the financial position of the company. They had, he said, declared the preference dividend from Jan. 1, 1909, to Oct. 14, 1909, and a further amount at the rate of 1 per cent. per annum from Oct. 17 to Dec. 31, 1908 (5 per cent. had been already paid for that period in accordance with the British South Africa Company's undertaking). Their profits had been secured by the work of the Brakpan and Simmer Pan stations. Those were erected almost entirely out of the moneys provided by the early preference and debenture issue. Besides providing for depreciation during the year (£38,963) and £82,550 for interest and income-tax on debentures, they had earned an additional amount almost equal to the carry forward for the year, —their realised profit was £157,749—their total debenture interest would

Digitized by Google

amount to £150,000. Thus the plant of the Brakpan and Simmer Pan stations, equivalent to about one-third of the larger output of the Rosherville and Vereeniging stations, were equal to meeting the interest demands of the whole debenture capital, leaving the profits on the shares and loan capital of the Rand Mines Power Supply Co. to provide for depreciation, amortisation and interest on share capital. The Power Undertakings Act, 1910, resulted in their having to exchange their concession for a definite license. This license would enable them to carry on their business under statutory powers for the full period of the concession. A further license had been acquired by the Rand Mines Power Supply Co. Active opertions were in progress at Vereeniging. That station would accommodate two sets each of 15,000 H.P. capacity. The foundations and water supplies were being so arranged that in the event of the engineers deciding that the increasing demands for power of the mining industry warrant the expenditure, additional sets could be expeditiously installed. Should the recommendations of their engineers necessitate any large increase, it would require that power be taken to increase the capital of the company. He did not, however, anticipate that it would be necessary; but the policy of the mining industry was in the direction of amalgamation, coupled with big electrical installations for reduction purposes, and it would not do to blind their eyes to the fact that, large as the business which they had secured was, there might in the future be considerable expansion. Undoubtedly savings in cost would follow the conversion of reduction plants to the electric drive; that would bring large quantities of ore hitherto considered unpayable within the limit of pay ore, and would thus increase in some instances the life of certain of the mines. Their asset in the Victoria Falls still remained in the background for future exploitation. They were not unmindful of its value, and the process for the treatment of the lead and zinc and copper ores of the north might yet provide them with a fertile source of profit.

The management in South Africa was still in the capable hands of Major the Hon. Walter Bagot, and he was ably assisted by Mr. W. E. Goldby as financial manager; and as chief engineer Mr. Bernard Price had amply fulfilled expectations. When they considered that their undertaking now consisted of four erected stations, one in course of erection, transmission lines extending for a distance equal to from London to Brighton, and that shortly, when the Vereeniging station was in operation it would mean an additional transmission system equal to the distance from London to Reading, together with a compressed air system equivalent to a pipe-line from London to Watford and back, that the total tons crushed on the Rand during 1910 were 21,500,000, and that their undertaking was responsible for providing nearly the whole of the power required for the reduction of 63 per cent. of that tonnage, they would appreciate the magnitude of the undertaking; and the responsibilities of their staff. He should not be doing his duty if he did not also mention the excellent work of their managing director (Mr. A. E. Hadley), who was absent in South Africa on their business when he last addressed them. Their contractors, in spite of a serious delay caused by the total loss of the steamship "Khedive" off East London, which had on board a large consignment of their machinery had maintained their delivery of plant, and the Rosherville station was now almost completed—not exactly on the date anticipated; but, taking into consideration that the action of the then Government of the Transvaal, through the introduction of the Power Bill, 1910, coupled with the shipwreck, caused delay beyond their control, he was satisfied that they had no reason to complain.

UNITED ELECTRIC TRAMWAYS OF MONTE VIDEO (LTD.)—Mr. G. A. Touche, M.P., stated at the meeting on Friday that the recent strike in Monte Video had affected all the tramways in the city, including their own. The directors made certain concessions and the conditions offered were accepted by the employés, who subsequently went on strike a second time, apparently with no justification. The strikers, being convinced of the firmness of the companies and wearying of the struggle, ultimately accepted this company's terms and resumed work. The strike had adversely affected the traffics while it had increased the permanent charges. The traffic receipts in sterling were £279,990, compared with £253,257, an increase of £26,733 (10½ per cent.); the total number of passengers carried was 32,474,355, against 29,293,804, an increase of 3,180,551 (over 10½ per cent.). Those results were obtained although 96,503 less car-miles were run compared with the previous year. The working expenses were 55·62 per cent., a decrease of 2·73 per cent., in spite of increased cost of maintenance and increased cost of coal. The net receipts amounted to £124,247, an increase of £18,775, or nearly 18 per cent. The first six months of the current year showed gross receipts £166,176, compared with £150,195, an increase of £15,981, or over 10½ per cent.; working expenses were 51·17 per cent., against 52·37 per cent., and the net receipts were £81,143, against £71,536, and deducting the decrease in May, owing to the strike (£3,170), the increase for the seven months was £6,437. For the past year the final dividend was 8 per cent. on the ordinary shares (making 7 per cent. for year), compared with 6 per cent. in 1910.

R. WAYGOOD & CO. (LTD.)—Mr. H. C. Walker referred, at the meeting on Friday last, to the past year's work of the company, which included a contract in connection with the new G.P.O. building in Newgate-street, London. In connection with the Festival of Empire at the Crystal Palace they had erected one of their electric passenger lifts from the terrace to the centre transept. Messrs. Harland & Wolff had entrusted them with the contract of fitting in the "Olympic" and "Titanic" eight electric passenger lifts and eight other electric lifts. As the result of fitting their lifts on the "George Washington," for the North German Lloyd, that company had placed an order for two passenger lifts for two of their largest ships. That was the first instance in which lifts had been fitted to ships already in service, necessitating special designing and arranging, and one of their engineers superintended the work of erection in Germany. A very large number of lifts for a wide range of users had been installed by the firm.

J. G. WHITE & CO. (LTD.)—The directors report for the year ended Feb. 28 states that the results of the business have continued to be satisfactory. The net profit on the year's trading is £91,466. The prospects for the future are looked upon by the directors as encouraging. The return of interest and dividends on investments during the year was equal to 8·2 per cent. on the amount of the valuation. The "Purchase of Business" account was written down last year out of profits from £47,975 to £15,000, and the directors recommend that the balance should be written off this year. A special dividend equalisation reserve is also established, and £15,000 out of the profits of the year are allocated to this account. The directors recommend an increase of the total dividend rate on both classes of shares to 12 per cent. per annum. This is the maximum dividend to which the preferred shares are entitled. In addition, an extra dividend of 10s. per share on the ordinary shares is recommended. After making these payments a balance of £19,813 will remain to be carried forward.

NEW COMPANIES, MORTGAGES AND CHARGES AND RECEIVERSHIPS.

NEW COMPANIES.

CANADIAN P. J. MITCHELL CO. (LTD.) (116,323.)—Reg. NOTES.

The I.M.E.A. Meeting.

In accordance with our practice since the formation of this Association, we publish, in another part of this issue, a full report of the proceedings at this year's Convention at Brighton. The gathering has undoubtedly proved to be a record one, the numbers attending reaching the handsome total of nearly 500. Many of the members have travelled long distances, from Dundee, Glasgow, Edinburgh, Belfast, &c., to be present. The weather, though on the windy side, has fortunately been brilliantly fine. The arrangements this year have been on much the same lines as in previous years and no particular innovation has been made, except, perhaps, on the social side. The Papers read have been, possibly, below the average of past years. This would suggest that the Association finds it increasingly difficult to get engineers to prepare Papers. The remedy is comparatively simple. Greater opportunity for discussion should be given to the members. Rather than read Papers and work up the audience to the pitch of boredom thereby, the plan, adopted on the last day of the Convention, of holding an informal discussion on some suitable subject, should be extended to all the technical meetings of the Association. There is much good matter, which is now reserved for discussion in the smoke-rooms of the hotels, that could very well be deliberated upon in open conclave. The members of the Association, too, complain that the circulation of typed questions has become a nuisance and a hindrance. Why cannot some of the more important of these questions be dealt with in open discussion at the Convention? We hope that next year the Council will take a decided step in this direction; and we venture to prophesy an increased membership and wider sphere of utility for the Association as a result.

Wiring Regulations.

All engineers will sympathise with Mr. J. W. Beauchamp in his desire, as expressed in his Paper read before the Incorporated Municipal Electrical Association, that the number of wiring rules should be reduced to one set. It must be admitted, however, that things are moving in the right direction, for there are by no means so many sets of rules as there were a few years ago. Those issued by the Institution of Electrical Engineers have made steady progress and are now adopted by a large number of supply and insurance authorities. Nevertheless, the fact remains that the number of rules still in existence is larger than it should be, and the result is mainly to impede contractors in their work. The existence of only one set of rules would secure greater uniformity of work and would give the inferior class of contractor less excuse for his faults than he has at present. Unfortunately, it is one thing to make rules and quite another to enforce them, and in this respect electric wiring is at a disadvantage, because so much of it is necessarily concealed. Frequent inspection during the progress of the work is essential if there is to be any certainty that the quality is what it should be. Yet the supply authority generally carries out merely an insulation test, the result of which may depend more upon surface leakage than anything else. In fact, under certain conditions, this surface leakage may render it very difficult

Digitized by Google

to obtain the specified result, and on that account alone it is desirable that wiring rules should be administered with some discretion.

ANOTHER point touched upon by Mr. BEAUCHAMP is the question of earth connections. It is no good earthing unless the earth connection is properly made. This is generally put out of sight and if found by a non-technical enquirer it probably appears to him to be a mistaken bit of work of an over-zealous contractor, which view is probably confirmed by the fact that if the connection is removed no harm seems to have been done. We notice that Mr. BEAUCHAMP suggests the use of a No. 18 wire as sufficient for earthing small installations. Electrically this may be the case, but for mechanical reasons we do not think so small a wire should be used. It generally costs very little more to put in a substantial connection, looking as if it really serves a purpose, and there is no reason why it should not be labelled as such to ensure proper respect.

The Electric Vehicle in Boston (U.S.A.).

THE slow development of electrically-driven vehicles in this country may be said to be due, in some measure at any rate, to the great improvements which have been made in the petrol engine. At one time much more progress was being made with the former type of equipment than is the case at present; electric broughams and landaulettes were being extensively used for town work and there was even in London a line of electrically operated omnibuses. The latter have entirely disappeared, and there seems some chance of the former meeting the same fate. It is of interest then to enquire why this unsatisfactory state of things should exist, seeing that in many ways the electric vehicle is possessed of advantages which are lacking in the petrol car.

FOR town work the two financial items that need be particularly considered are maintenance of the battery and the cost of charging. The limited radius of action is no disadvantage, because batteries of capacity sufficient for a day's work in town can easily be used. As regards the battery, present-day accumulators are quite capable of operating under traction conditions; and it therefore remains to be seen whether all is being done by the supply authorities in granting facilities for charging. This is important; for charging is an operation which occurs very often in the life of a battery and is particularly necessary to the electric vehicle. It is at this point we fear that we have failed in this country. Scarcely sufficient facilities have been given in the way of low rates for charging accumulators, and electrical engineers have not been sufficiently enterprising to use electric vehicles and so emphasise the advantages obtainable. This is unfortunate, for how much can be done is indicated by the results of a campaign recently undertaken in Boston by the Edison Electric Illuminating Co. This campaign was undertaken to create interest in the electrically propelled vehicle for pleasure and commercial uses, particularly the latter. To show its faith in its own prescription the Edison Co. changed all its vehicles to the electric drive and now, as the result of several months' working, it is able to announce that the economies effected will soon pay off the capital outlay. Further, an organisation known as the Electric Vehicle Club, whose membership consists of dealers in electric vehicles and accessories, has taken the matter up very strongly, and much editorial space is being given to the subject in the local newspapers. With these examples in front of them it is not to be wondered at that the inhabitants of Boston have gone in strongly for the electric vehicle. According to a local paper every dealer and agent in the city reports a large number of enquiries about electric cars; and the vehicles are, in fact, being sold faster than they can be delivered. Everyone speaks highly of their reliability, and their employment for emergency purposes, such as fire engines is becoming more and more extended. The results of the campaign are therefore highly satisfactory. Cannot our own supply authorities take the hint?

The London Electrical Engineers, Royal Engineers.—We take the following announcement from "The London Gazette" of Friday evening last:—Lieut.-Col. and Hon. Col. (Honorary Maj. in the Army) Rookes Evelyn Bell Crompton, Retired List (Territorial Force), is appointed to the Hon. Colonelcy of the unit. (June 24.)

Harmonic Analysis Diagrams.—*Erratum.*—We regret that in the footline to Fig. 4 of Dr. Beattie's article on the above subject, which appeared on p. 371 of our issue of June 16th, "fifth sine and fifth cosine terms" should read "second sine and second cosine terms."

Turin International Congress for the Applications of Electricity.—The following have been appointed as delegates to represent the Institution of Electrical Engineers at the Congress which is to be held in Turin in September, 1911:—Mr. S. Z. de Ferranti, Col. R. E. Crompton, C.B., Mr. W. Duddell, F.R.S., Dr. R. T. Glazebrook, C.B., F.R.S., Mr. R. Kaye Gray, Mr. R. Hammond, Major W. A. J. O'Meara C.M.G., Mr. A. Siemens and Dr. S. P. Thompson, F.R.S.

Telephony in San Francisco.—This subject was dealt with in a Paper read by Mr. S. G. McMeen before the Western Society of Engineers, and reported recently in the "Electrical Review and Western Electrician." The city of San Francisco has a population of about 465,000 and with the cities of Oakland and Berkeley, across the bay, the metropolitan area comprises a population of about 609,000. The three cities are equipped with an automatic telephone system divided into two main portions, that in San Francisco being equipped with the two wire system and that in the trans-bay cities being built on the three-wire system. The two groups are connected by a cable about 8½ miles long, of which 3½ miles are submarine. Each of the two main sections of the system has a main exchange and four branch offices, with a number of subsidiary offices containing only the subscribers' line switches. The climatic conditions of San Francisco are peculiar, and one of the most severe problems was to make the system moisture-proof. This was done by using underground lead-covered cable for all the main trunk and lateral lines, so that open overhead wire was used only for drop-wire purposes, and even these were insulated. The cables and conduit lines were laid out on the basis of estimated traffic conditions up to 1925. The effective calls are registered on meters, and a number of private branch exchanges, also worked on the automatic system, are in use.

Cable Interruptions.	Date of Interruption
Assab—Perim	July 8, 1909
Malta—Tripoli	April 20, 1910
Latakia—Palura	May 26, 1910

Corona Losses on Transmission Lines.—The "Electrical World" states that experimental sections of high-tension transmission lines are being constructed at Purdue University, Lafayette, U.S.A., to study the corona losses occurring under conditions of high potential. A steel and a wooden pole line are being erected, the latter being equipped with movable insulator pins so that the distance between the wires may be varied. These transmission lines will be excited from the 300,000-volt transformer in the electrical engineering laboratory.

Electricity Supply on the Isthmus of Panama.—The "Electrical World" states that a new 500 kw. 2,200-volt three-phase turbo-generator is to be installed in the electric generating and air-compressor station near East Balboa on the Isthmus of Panama, replacing all the present electrical generating equipment at that point. Hitherto direct current has been used for the operation of the cranes on the Panama Railroad wharf and for the motors in the Pacific Division machine shop. These motors will now be superseded by alternating-current machines when the new generator, which is to be driven by the exhaust steam from the air compressors, is in operation. This will not only constitute a fuel economy, but obviate any necessity for additional boiler capacity. The Miraflores plant will supply the night load. In addition to the electricity required at Balboa during the day there is sufficient energy in the exhaust steam to enable the Balboa plant to transmit from 100 kw. to 200 kw. to the system now operated by the Miraflores plant.

Electricity and the Gala Performances.—Electricity has played an important part in the two gala performances given by H.M. the King in connection with the Coronation celebrations, the one at Covent Garden Theatre on Monday night and the other at His Majesty's Theatre on Tuesday. Besides being used for the stage and general lighting, electricity was in both cases combined with the decorations to give an exceedingly artistic effect. The house at Covent Garden was decorated throughout with roses, over 100,000, some real and some artificial, being used. From trellis work beneath the lowest tier of boxes the blooms rose circle above circle to the highest gallery, the intertwinings being lighted up with hidden lights. The King's box was decorated with a frieze of gold, white and mauve orchids, while in the box itself carnations were used, and here again electricity was used as a sub-decoration. The proscenium, too, was outlined with flowers and lamps. At His Majesty's a much simpler scheme was used. Round the boxes were festoons of poet's laurel, supporting clusters of golden fruit. The proscenium opening was decorated with crimson roses mingled with laurels. Here, again, electricity was used to bring out the beauties of the flowers, while special advantage was taken of it in decorating the fountains in the foyers. The extraordinary number of "star" actors and actresses taking part in the performance made some extra dressing room accommodation necessary. This was obtained by boarding up the ends of the arcade next the theatre and fitting the dressing tables which were placed in it by a temporary installation fed from the theatre mains.

International Electrotechnical Commission.—In conformity with the wishes of the Brussels Conference held in August, 1910, the delegates of the British, French and German Electrotechnical Committees met at Cologne in the middle of May last and accomplished very excellent work. Prof. Eric Gérard, having presided at the Brussels Conference, at which the subject of nomenclature had been much discussed, was specially invited to attend, so that not only was there a concurrence of ideas, but the delegates were entirely free to put forward their particular views. Those present were:—Prof. Eric Gerard (President of the Belgian Committee), M. E. Brylinski (Delegate of the French Committee), Dr. E. Budde (President of the German Committee), Dr. S. P. Thompson, F.R.S. (Delegate of the British Committee), and Mr. C. le Maistre, General Secretary of the Commission.

Before the actual work of the meeting was commenced, a most important suggestion was outlined by Dr. Budde dealing with the international unification of symbols. On behalf of the German-speaking nations, as represented by the Elektrotechnischer Verein of Berlin, Dr. Budde said that they would be prepared to abandon the use of "W" for resistance and adopt "R," if the English-speaking nations, on the other hand, would adopt "I" instead of "C" for current. Dr. Budde was quite ready to exclude "J" as synonym for "I," owing to the confusion which would arise due to the fact that "J" is already employed to represent other quantities. Dr. Thompson, on behalf of the British Committee, willingly concurred in this suggestion, and as the American Institute already employs "I" and, through the good offices of the American Electrotechnical Committee, the National Electric Light Association of America is being approached in the matter, there is every hope that at Turin the symbols "I," "E," "R" will be universally adopted. Such a decision, if ratified by the Commission, as no doubt it will be, will certainly be a most encouraging step in the right direction. The discussion of the work of the various Committees on the German list of terms put forward at Brussels was then entered upon, and a list of some 50 industrial terms and definitions was agreed to in French and English. The word "industrial" has been introduced so as to distinguish this work from that of the vocabularies in course of preparation by several of the Committees. The reason being that the vocabularies include definitions of a character more abstract and general and more rigidly scientific than is necessary in the case of industrial terms, which are more conventional and can therefore be defined in less academic language and yet prove of inestimable value to the industry by facilitating commercial transactions between buyer and seller. As the time at their disposal was so limited the delegates intend to meet again at Turin early in September so as to have an opportunity of revising their work prior to submitting it to the plenary meeting. In the meantime the work already carried out is being issued to the various Committees for their consideration. Special mention must be made of the work of the Danish Committee which was presented in such an admirable manner and has been of very considerable assistance to the Committees generally. The work of the Japanese, the Mexican and the Spanish Committees was also most complete. The small Committee has been so successful in its task that in all probability the appointment of other small international Committees, to study certain particular subjects in a preparatory manner, will be considered in the near future, and thus work will be going on continuously and more rapid progress thereby ensured.

Current Topics.

Subjects of current interest dealt with in this issue include the following:—

We give a complete account, up to last evening (Thursday), of the proceedings at the Convention of the Incorporated Municipal Electrical Association, held this week at Brighton. The presidential address was delivered by Mr. J. Christie, and the following Papers were read: "Electricity Supply from the Municipal Committee's Standpoint," by Councillor H. Leese; "Modern Wiring Practice," by Mr. J. W. Beauchamp; "Internal Combustion Engines Working on the Diesel Principle," by Mr. H. L. Howard; and "Internal Combustion Engines for Power Stations," by Mr. R. M. Carr. Abstracts of these Papers and of the discussions that took place are given in this issue, also of the two discussions that took place yesterday, viz., "Purchase of Fuel," opened by Mr. C. E. C. Shawfield, and "Street and Shop Front Lighting," opened by Mr. A. H. Seabrook.

We describe the Faraday House Testing Laboratories.

The public service of rail-less trolley vehicles was opened at Bradford on Saturday.

We give an account of part of the first day's proceedings at the Education Conference organised by the Institution of Civil Engineers, which was held this week on Wednesday and Thursday.

Municipal Loans.—An inquiry was held last week at Worcester into the Council's application for sanction to a loan of £3,375 for extensions of the electricity undertaking, on Wednesday at Aldershot an inquiry was held into an application for sanction to a loan of £2,500 for extensions of the electric supply department, and an inquiry has also been held at *Bispham* into the Council's electricity supply scheme involving an expenditure of £9,180. *Ealing* Corporation have been authorised to borrow £18,500 and *Walthamstow* Council £9,206 for extensions of their electricity undertakings.

Parliamentary.—The Telephone Transfer Bill was read a first time on Tuesday.

A Bill of 201 clauses has been introduced into the House of Lords to consolidate and amend the law relating to railway traffic.

A Bill to confirm the Pateley Bridge Electric Lighting Provisional Order has been passed by a Select Committee of the House of Lords.

Legal.—The Court of Appeal have allowed the appeal of the Postmaster-General from the decision of the Light Railway Commissioners as to the validity of the notices of objection to certain plant, &c., of the National Telephone Co., and the cross appeal of the Company was dismissed, with costs.

Digitized by Google

Mr. Muir Mackenzie, Official Referee, has continued the hearing of the action brought by Messrs. W. Canning & Co. against the Northern Flexible Metallic Tube Co. for the recovery of the balance of the price of an electric galvanising plant.

Mr. Justice Bray has delivered an interesting judgment in the action Hartlepool Electric Tramways (Ltd.) *v.* Hartlepool Corporation.

A Divisional Court has dismissed the appeal of the Metropolitan Electric Tramways (Ltd.) as to the rating of the Company's lines in Tottenham.

Companies' Meetings and Reports.—Among the reports of meetings reported are those of the Indo-European Telegraph and the Globe Telegraph & Trust Companies; while reports of the Bombay Electric Supply & Tramways Co., the Chilian Electric Tramway & Light Co., Greenwood & Batley, and the Marconi International Marine Communication Co., &c., are also given.

OBITUARY.

Mr. P. S. Sheardown.—We regret to record the death of Mr. Percy Sewell Sheardown, electrical engineer of Dublin, which took place in London on 19th inst. Deceased, who was suffering from breakdown, due to overwork, came to London to see a specialist.

Mr. Sheardown received his technical education at the City and Guilds of London College, Finsbury, under Prof. S. P. Thompson and Prof. John Perry, during 1892-3-4, obtaining first place at the final examination in electrical engineering in 1894, and a medal and prize from the examining body. After a short service as assistant to the engineer at Bray electricity station, he joined the staff of the British Thomson-Houston Co., and worked in Dublin on the electrification of the Dublin to Dalkey tramway line. Later he joined the staff of the Dublin United Tramways Co. as assistant electrical engineer, was with the Company throughout their change-over to electric traction, and he held the appointment of chief electrical engineer to the Company at the time of his death. Mr. Sheardown took much interest in technical education questions, and was a lecturer on the engineering staff of Trinity College, Dublin University. He was vice-chairman of the Dublin local section of the Institution of Electrical Engineers in the session 1905-6.

G. Carels.—The death is announced of M. Gustave Carels, of Carels Frères, Ghent, manufacturers of turbines, steam engines, &c.

APPOINTMENTS VACANT AND FILLED.

Dundalk Urban District Council invite applications for the appointment of resident engineer for their electricity undertaking. The successful applicant will act as clerk of works, under the Council's consulting engineer, during the construction of the works. Salary £250 per annum. Applications to the town clerk (Mr. Mathew Comerford), Town Hall, Dundalk, by Monday, July 10. See also an advertisement.

A firm of incandescent electric lamp manufacturers require a qualified representative for the London district. See an advertisement.

A first class electrical engineer is required to take charge of instrument works. See advertisement.

A firm of electric incandescent carbon lamp makers require a skilled foreman for the stem, depositing and flashing departments. See advertisement.

A skilled assistant engineer is required for an incandescent electric lamp factory, with experience in the manufacture of carbon and metal lamps. See advertisement.

A meter tester and testing assistant is required for one of the electricity works of the County Borough of Stoke-on-Trent. Commencing salary 26s. per week. Forms of applications, &c., from the borough electrical engineer (Mr. C. H. Yeaman), Hanley electricity works, Stoke-on-Trent. See advertisement.

Owing to increased business, it has been necessary to reorganise the staff of the Clyde Valley Electrical Power Co., and the following changes and reappointments have taken place:—

Mr. D. A. Starr remains general manager and Mr. R. Robertson, who has held the post of secretary for several years, becomes commercial manager with charge of the selling and development department. Mr. H. E. Ferguson, who has held the position of chief accountant for several years, has been appointed secretary. Mr. D. MacFarlane MacLeod is resident engineer, and Mr. W. G. Crawford mains superintendent.

Mr. E. Taylor, fourth engineer in charge to Hammersmith (London) Council, has resigned to take up an appointment under the Board of Trade.

W. G. Hindley (Melbourne Corporation Electricity Department) has been appointed by Hampden (Victoria) Shire Council as chief engineer of the Camperdown and Terang electricity works.

Mr. G. D. Mathews, A.M.I.C.E., A.M.I.M.E., A.M.I.E.E., has left the Government service at the Royal Arsenal, Woolwich, and has joined the staff of the Tudor Accumulator Co., 119, Victoria-street, S.W.

INSTITUTIONS AND SOCIETIES.

Royal Society of Arts.—The annual report presented at the annual general meeting of the Society this week, mentions that the office of president has now been accepted by H.R.H. the Duke of Connaught. Up to the death of King Edward VII. it was occupied by H.R.H. the Prince of Wales (King George V.), and, on his accession to the throne, it was temporarily held by the Lord Chief Justice. There has been, as usual, an increase in the entries for the Society's examination, the total number of Papers worked this year being 24,360. Under the Fothergill Trust the Council has made the following awards for life-saving apparatus for use in mines and places where the air is noxious: gold medals to Mr. H. A. Fleuss and Mr. W. E. Garforth; and silver medals to Mr. R. Jacobson and the Mining Engineering Co. The Society's Albert Medal has been awarded to the Hon. Sir Charles A. Parsons, K.C.B., F.R.S. The Council, with a few alterations, was re-elected.

EDUCATIONAL NOTICES.

University of Sheffield.—The faculty of applied science comprises the departments of engineering, metallurgy, coal mining and architecture. The courses in engineering or in metallurgy extend over three years and prepare respectively for the degree of B.Eng. or B.Met. of the university. The lecture courses commence Oct. 4 and the technical laboratory courses on Sept. 18. Prospectuses and other particulars from the registrar, Mr. W. M. Gibbons.

City and Guilds Technical College.—This college provides a scientific training for students preparing to become electrical and mechanical engineers or chemists and for engineering pupils who desire to supplement their practical training by a two years' course of instruction in the principles of engineering science. The instruction is mainly given in the various laboratories, most of which have been recently re-equipped. The subjects of the entrance examination are mathematics and English, but the matriculation of any British University is accepted. The courses in electrical and mechanical engineering cover a period of two years and those in chemistry three years. There are also arrangements for three year courses in engineering. Particulars at the college, Leonard-street, City-road, London, E.C., or from the City and Guilds of London Institute, Gresham College, Basinghall-street, London, E.C.

ARRANGEMENTS FOR THE WEEK.

FRIDAY, June 30th (to-day).

Incorporated Municipal Electrical Association.

10 a.m. Annual General Meeting at the Royal Pavilion, Brighton.
2:30 p.m. Motor trip to Arundel.

Physical Society.

5 p.m. Meeting at the Imperial College of Science. *Agenda:* "On the Effect of a Narrow Sawcut in the Edge of a Conducting Strip on the Stream Lines in the Strip and on the Resistance of the Strip," by Prof. C. H. Lees, F.R.S.; "The Capacity Coefficients of Spherical Electrodes," by Dr. A. Russell; "Exhibition of the Benkö Primary Battery," by Mr. W. R. Cooper.

NATIONAL ELECTRICAL MANUFACTURERS' ASSOCIATION.

WEDNESDAY, July 5th.

12 noon. Council Meeting at the Institution of Electrical Engineers, Victoria Embankment.
3 p.m. Special General Meeting at the Institution of Electrical Engineers.

THURSDAY, July 6th.

2:30 p.m. Council Meeting at Balfour House, Finsbury-pavement E.C.

THE LONDON ELECTRICAL ENGINEERS.

Officer Commanding, Col. H. M. Leaf.

The following orders have been issued for the current week:—

Head Quarters will be closed for instruction during the week.

Saturday, July 8th.—The Plymouth Detachment will parade at Headquarters at 9:30 a.m. Dress: Service dress, drill order, with water-bottle and haversack. Arms will be drawn before this parade.

SIXTEENTH ANNUAL CONVENTION OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION.

The I.M.E.A. is to be congratulated on its decision to migrate to the seaside for its annual meeting this year. The Conventions of the past few years have been confined to inland industrial centres, mainly because the Presidents of the Association were selected from towns in which large municipal stations were in operation. The seaboard towns, particularly those in the south, had been overlooked in choosing a *venue* for the annual Convention, and in Brighton not only has a good electrical centre been hit upon, but a seaside pleasure resort which it would be difficult to beat. Among the principal members attending the Convention we may mention Messrs. S. L. Pearce, G. Wilkinson, R. A. Chattock, J. E. Edgcome, W. W. Lackie, H. Faraday Proctor, C. E. C. Shawfield, S. J. Watson, A. C. Cramb, H. Richardson, A. H. Seabrook, C. H. Yeaman, F. M. Long, T. P. Wilmshurst, H. Collings Bishop, F. A. Newington, C. M. Shaw, A. A. Day, A. Clough, Aldermen G. Pearson, Sinclair, G. P. Smith, West, &c. A large number of visitors, among whom we noticed Mr. S. Z. de Ferranti (President Inst.E.E.) and a goodly sprinkling of ladies, were also present.

Brighton, Tuesday, June 27th.

The bulk of the members arrived in Brighton on Monday evening, and at the opening meeting on Tuesday morning the Mayor of Brighton extended a welcome to a "crowded house." In his opening remarks the Mayor established a precedent by omitting the well-worn phrase that electricity is "still in its infancy." He thought that the members would find much to interest them in the electrical undertaking at Brighton, especially as it was one of the oldest in the country, and had been in progressive hands from the start. He paid a high compliment to Mr. Christie, under whose guidance the scheme had been brought to its present state of efficiency.

After a vote of thanks to the Mayor for his presence in welcoming the Association, Mr. Christie read his Presidential Address.

PRESIDENTIAL ADDRESS.*

BY J. CHRISTIE.

When this Association met here, 15 years ago, in these same rooms, we were a comparatively small and unimportant gathering, numbering only 114 all told, made up of 38 municipal, 48 engineer and 26 associate members, and the total capital of the undertakings we were then responsible for did not much exceed £3,000,000. Our growth since then has been rapid, and to-day our roll of membership has increased to a total of 407, comprising four honorary, 168 municipal, 187 engineer and 48 associate members and associates; and as an Association we can justly claim to voice the opinions on matters electrical of practically the whole of the municipal undertakings throughout the Kingdom, whilst the capital invested in the machinery and plant directly under our control, and exclusive of tramway and company undertakings, has increased in these few years to upwards of £41,000,000.

Mr. Arthur Wright in the first presidential address most clearly enunciated the various questions of policy which should guide us in the administration of our responsible duties, and it is most gratifying, especially to those of us who have been members of the Association since its inception, to note how many of the intricate problems dealing with the commercial and technical sides of our business have been so satisfactorily solved, in many cases as the outcome of action taken by our Association.

Each year the task of finding a suitable text for the Presidential sermon becomes more difficult, and I must confess to having failed to hit on any new or original theme on which to address you.

The town of Brighton has always held a prominent place in the history of electric lighting and traction progress, and so far as I can ascertain she can claim to have been first in the field with regard to both these branches of our business. The first electric railway in this country was started here in August, 1883, through the enterprise of Mr. Magnus Volk. This line, running along the eastern sea front, is still in successful operation, and it is worthy of note that the dynamo now driving it has been in regular daily use for upwards of a quarter of a century. The only radical change effected, except with regard to modernising and improving the permanent way, rolling stock, &c., has been to replace the gas engine, which was the prime mover in those early days, with a 60 kw. motor and battery operated off the Corporation supply mains.

So far back as 1891 one of the earliest experiments in electric lighting in this country was carried out under the auspices of the Brighton Corporation. The installation consisted of six arcs, each lamp being run off its own separate machine. These for a time lighted a portion of the Madeira-road, and were then regarded as one of the wonders of the age. The following year Messrs. Hammond & Co. laid down a small plant which supplied a series of arc lamps installed in the business premises of several of our leading tradesmen, and this I believe was the first instance of a central station for the public supply of electricity being established in this country.

This pioneer lighting company kept pace with the times, the series arc, and, later, the ingenious multiple series incandescent lighting in turn gave place to the single-phase 2,000-volt alternating-current house-to-house transformer system.

In 1891 the Corporation obtained a Provisional Order, and shortly thereafter commenced a two-wire continuous-current supply with underground mains, competing for business with the company. In 1893 the goodwill of the company's business was purchased by the Corporation for the sum of £5,000, the old plant being finally shut down and sold a few months later. The supply business in the hands of the Corporation and under the management of your first president (Mr. Arthur Wright) continued to prosper; the two-wire system was changed over to a three-wire system, high-tension single-phase alternating current was again introduced to meet the demand in the outlying area at times of peak load, later the voltage of the supply in these districts was doubled, and the continuous current once more displaced the alternating.

In 1905 the North-road works as a steam generating station was superseded by the new three-phase turbine waterside station at Southwick, and the nuisance from a large works in the centre of the town was thus removed. The old works are now only used as a sub-station, probably one of the largest of its kind in the country at the present time, containing as it does upwards of 8,000 kw. of converting plant of various types.

To meet the continually increasing demands in the outskirts of the town, we will shortly have again to establish sub-stations, either equipped with three-phase alternating-current plant, or self-contained engine units of the internal combustion type. Thus history repeats itself.

Like all pioneers, our undertaking has had to pay the penalty of heavy capital outlay per kilowatt of useful capacity, although this is rapidly righting itself, due to many of the early loans becoming extinguished. As an offset against this, owing to the long use and acquaintance with the many advantages of electricity, we have established a goodwill which is now an asset of no mean value, as at the present time we have got 5,239 customers connected to our mains, and the consumption of electricity per head of population last year amounted to no less than 78 units, which still constitutes a record for a non-industrial town of 132,000 inhabitants.

Most undertakings by this time have successfully passed through that period of stress and reduction in lighting output consequent on the introduction of the metal filament lamp, and although we have all more or less experienced a temporary set-back and loss of revenue due to this cause, we can now only regard its advent as a blessing in disguise.

Brighton was the home of the maximum demand system of charging. We are generally agreed that this system is undoubtedly the most equitable from both the consumer's and supplier's point of view, and for fixing prices for large lighting and power contracts it must still always form the basis of our reckoning. There is, however, no denying the fact that even here, where it was first evolved, it became with certain classes—and they were in the majority—unpopular. So, in deference to the popular demand for an easily understood flat-rate, our Council some three years ago wisely granted the concession asked for. The maximum demand system for all new business was abolished; this rate to existing consumers who elected to retain it was at the same time raised from 7d. and 1d. to 6d. and 2d. per unit, the alternative offered being a flat rate of 4d. per unit for domestic and shop lighting, and 3d. per unit for hotels, licensed premises, churches, &c., with special rates to very large consumers of either class. This

* Abstract.

somewhat drastic change of policy fortunately came into force just as the metal filament lamp came into general use, and to-day everyone is satisfied with the result.

How this tariff question will ultimately be solved it is impossible to say. In discussing the matter with Mr. Wright some months ago, he put forward as his belief that we might ultimately come to a fixed charge per square foot of floor area on the basis of a given number of watts per square foot, have no meters, and allow consumers to use the supply for any purpose without other restriction. On the grounds of simplicity this suggestion has much to commend it as compared with the "Telephone," "Norwich" and other systems we now hear so much about.

The development of a day load power supply on the restricted-hour basis is also another phase of our business which was first introduced in Brighton. This class of business comprises engineering shops, printing works, laundries, breweries, mineral-water factories, refrigerators, saw mills, ventilating and domestic machinery, and we have also obtained a lucrative business in charging the accumulators of electrobuses and other battery-driven vehicles. From these sources we have now worked up a day load of some 3,000 H.P. connected, consuming last year almost 3,000,000 units, and this has so improved our load factor that we have been able to effect most marked economies in our works costs. Practically all the small isolated steam plants in our area have now been displaced by electric motors, and the consequent diminution of the smoke nuisance resulting therefrom is a matter of no small importance in a health resort like Brighton.

There must be many cities and towns in the provinces more or less similarly situated which are also to a great extent immune from dense fogs where this system, with the restricted hours so modified to suit local conditions, could be adopted with advantage to both the consumer and the supply authority, and I can heartily commend it to my brother engineers for their careful consideration.

Now that electrically-operated bakers' ovens are a commercial success, this also opens up another class of business of somewhat similar character well worthy of investigation. These make demands, according to size, of from 25 kw. to 100 kw., and are usually only wanted between, say, 11 p.m. and 6 a.m., when our plant and mains are otherwise comparatively idle. The first cost and cost of maintenance are by no means prohibitive, and we could well afford to cut the price for this class of business to something like ½d. per unit, at which figure, I am informed, we can effectively compete with the existing methods of heating these appliances, whilst the advantages in the way of cleanliness and ease of regulation are all in favour of electricity.

In conjunction with the development of this power, heating and cooking business, it is most essential that the supply authority should also possess powers to sell and hire out motors and other suitable appliances. No hardship can be imposed on the local contractor by granting them, as in most provincial towns the average contractor is not in a position financially to establish a hiring system, and the prospective user for similar reasons is unable to purchase these accessories through the contractor.

We, in Brighton, have enjoyed these powers to sell and hire, but not to wire, since 1901. We never exercise them if there is any possibility of a consumer doing a deal through his contractor, and where we hire we have never experienced any insurmountable difficulty in arranging between the hirer and his contractor to carry out the necessary wiring. Invariably, however, we find that consumers who could afford to buy their motors outright prefer to continue to hire from us, and to have the assurance of knowing that all our stock of spares and the resources of our department are at their disposal in case of trouble. The rental we charge for motors is some 20 per cent. of prime cost, and for this we insure, clean, oil, adjust and regularly inspect each machine. This return with the service rendered just pays its way with a bare margin of profit, writing off the cost in ten years, but the department undoubtedly gains by the increased sale of energy and the satisfaction we are able to afford our consumers, and doubtless in turn this policy must be extended to the hiring of heating and cooking appliances which are daily coming into more general use.

As a matter of equity, these powers should be granted to all undertakers who seek them, and the fact that the money necessary to put them into force can only be raised after a Local Government Board inquiry has been held is, I think, sufficient guarantee that they will not be abused. No fewer than 28 undertakings, involving a capital outlay of upwards of £11,000,000 sterling, already possess them, and this is a very strong argument in favour of our legislation being revised so as to allow of all authorities being treated alike.

This brings me to the wider question of municipal trading—wiring, supplying and selling electric light fittings—and I must candidly confess that I am not in sympathy with municipal authorities carrying out this work themselves except under very exceptional circumstances. By friendly co-operation with the electrical contractors, much unnecessary expense in the way of elaborate show-rooms, canvassing and publicity organisation can often be saved without detriment to the undertaking in any way. I do not wish it to be thought that I depreciate these useful adjuncts to obtaining new customers, but I am convinced that in certain instances this so-called business-getting has been overdone. A suitable show-room to interest consumers and to demonstrate the use of the latest novelties in systems of lighting, power, heating and cooking apparatus, is most desirable, and if judiciously operated in conjunction with the collector's office, it forms one of the most valuable advertisements an undertaking can possess, but I do not consider that it is by any means always necessary actually to sell the goods to ensure success.

All undertakings where possible should have the collection of their accounts in their own hands, thus enabling the department to get into personal touch with the consumer, and to deal promptly first hand with any complaints that may arise. Some three years ago we took over the collection of our own accounts, and the results have been most satisfactory in every way, whilst bad debts have been reduced by no less than 60 per cent.

A capable engineer as publicity officer to assist and advise consumers free of cost as to the lay-out of their installations to the best advantage is also a necessity in all well-organised undertakings, and this is a branch of our business in which at the present time there is a dearth of suitable men. I would urge young engineers who possess the necessary personal qualifications to specialise in this department.

We are often alluded to as municipal traders, and in a sense this is true, but I consider it is wrong for us absolutely to compare ourselves with gas and electric supply companies. These concerns are in business primarily to obtain the biggest dividends they can possibly earn for their shareholders, irrespective of all other considerations, and their management have a more or less free hand to achieve this end. The concession to supply electricity (now so essential to the well-being of all communities) was granted to us in order that we might do the greatest good to the greatest number in our towns, by affording an efficient and reliable supply of electricity for lighting and power purposes at the very lowest possible cost, whilst paying our way.

If we embark in this retail trading, carrying out wiring installations, &c., to justify the existence of this new branch of our business, we must at times have to go into the highways and byways to obtain fresh consumers, and I fear that by so doing we will only boost up an artificial and temporary demand, necessitating the raising of additional capital to meet it, seldom finding that it will yield an adequate return on the outlay incurred, and in the end doing our undertakings no real lasting good.

By all means keep your wares well before the public eye; believe in them yourselves; do all you can to persuade others to believe in them; induce your committees to lay mains broadcast and of ample section wherever there is any reasonable prospect of business resulting; have a simple, easily understood tariff, as cheap as circumstances will permit; and lastly, if possible, keep friendly with and assist the local contractor and do not hamper him with harsh and unnecessary restrictions; then business of the right sort will, I am sure, come along almost automatically and just as fast as is good for your undertakings.

I would like to take this opportunity of referring to the work of the Electricity Supply Publicity Committee, and I cannot too strongly urge all municipal authorities to afford this committee every possible support and assistance in their power.

Alderman Pearson proposed and Mr. C. E. C. Shawfield seconded a vote of thanks to Mr. Christie for his address.

The President then called on Councillor Leese to read his Paper

ELECTRICITY SUPPLY VIEWED FROM THE MUNICIPAL COMMITTEE'S STANDPOINT.*

BY COUNCILLOR LEESE, J.P.

(Chairman of the Stoke-on-Trent Electricity Committee.)

Summary.—The author discusses a few of the subjects with which an electricity committee has to deal. Extensions, size of plant, profits, cost of supply, showrooms and tenders are all considered.

The Chairman of a Committee has to occupy a somewhat thankless position. He acts as the spokesman of his Committee to the Council and to the public, and often is called upon to be the interpreter of his engineer's reports and statements to the Committee; at the same time he is the buffer between the oft-conflicting forces of other municipal departments and his own; the recipient of all the grievances and complaints alike of workmen and of consumers. It seemed to the writer that some attention might usefully be directed to a few of these subjects.

* Abstract.

Digitized by Google

In the first place, in connection with requests for information, it would avoid misconception if the term "units unaccounted for" was discontinued and something like "units utilised in distribution" inserted in its place. Also, why are engineers so fond of talking of the pounds of steam per kilowatt-hour? In this country, at least, it would surely be simpler and more direct to say "per Board of Trade unit."

It recently fell to the lot of the writer, as the chairman of the Electricity Committee of the district formed by the federation of the six Pottery towns, to have to consider what steps should be taken to deal with the immediate future needs of that moderately large area. Four of these towns owned electricity works, there being a difference in the pressure of supply between the three continuous-current systems, while the fourth was single-phase alternating.

After going into the question carefully it has been decided not to make additions to the small plant in the existing stations, but to build and equip a new power station, as nearly as possible in the centre of the area of supply. The scheme comprises a central power station (which will be connected with the four existing stations by trunk mains) containing two 1,500 kw. turbo alternators with the necessary equipment of boilers, switchboards, &c. The intention of the committee being to use the existing direct-current plant at Burslem and Stoke and the alternating-current single-phase at the Hanley works so long as it is economical to do so, and to supplement it with power in bulk from the central station. The four existing works will be equipped with rotary or motor convertors for the direct-current and motor generators for the alternating-current systems. Then, during heavy loads, the local steam plant will assist the new power house, and on light loads the supply can, if found desirable, be taken in bulk from the latter. The problem was complicated by two of the works having destructors combined with them and by the difficulty of coupling two alternating systems and still maintaining flexibility.

It appears from the records of what is taking place throughout the country that not one system but a combination of systems will soon be quite a common thing.

The size of plant for extensions is next discussed by the author, who considers that there is little advantage in going above 1,500 kw. sets for the majority of cases, especially as duplicate sets are usually considered necessary. Those committees who have put in single turbine sets trusting to their never going wrong seem to the author to have failed to recognise their responsibilities.

Some curves are also given to show the effect of not making extensions, it being found necessary to run a set of old make and small size during peak loads.

Profits.—Whether a profit from the electricity works should go towards a reduction of the rates is a very debatable point. The writer has always been of the opinion that in all industrial concerns owned and controlled by any Corporation a price should be fixed for the particular commodity they have for sale, such price to be sufficient to realise a sum which will provide all working expenses, interest on and repayment of capital, depreciation, and build up a reserve fund to meet unforeseen contingencies. If during any year's working a profit is made over and above what will provide for the above items, some arrangement should be made to give the consumer the benefit either by extra discount or other method to be decided by the committee. It has been argued that as the general rates are mortgaged for these industrial concerns, it is the whole of the ratepayers who should receive any benefit there is to be had. To show how unfairly this very often works out, take the writer's own district. A penny rate produces about £3,000, which means if the Electricity Committee decide to hand over £3,000 towards the rates, a fairly large number of consumers of electricity in this district, whose rateable value is about £9 or £10, would receive a reduction in their rates equal to 10d. per annum.

Again, a large manufacturer whose rateable value is £800 would receive a reduction equal to £3. 6s. 8d. on his rates and very often it will be found that the manufacturer has already been supplied with electricity for power purposes at the lowest charge it is possible to make with the object of increasing the day load at the works. Thus, the manufacturer has not only the benefit of cheap power but is also given an additional benefit in reduction of rates at the expense of the smaller consumer.

In the writer's opinion everything that can be done should be done to popularise the use of electricity in the houses of the poorer classes, and if a price must be charged in order to produce a profit for the reduction of rates then it will seriously handicap committees in the direction indicated.

When the six Potteries towns were federated, a clause was inserted in the Federation Act which compels the Gas and Electricity Committees in that area so to conduct the various works that no profit shall be made which can be handed over in reduction of rates. But in the event of a profit being made in any one year, then the price of electricity and gas shall be so adjusted as to absorb that profit.

This clause has given rise to a very peculiar situation, viz., during the discussions at the Council meetings one of the arguments used was that seeing no profit could be made for the reduction of rates, no extension should be made at the electricity works, no more customers should be taken on and the various works should remain as they were; the most ridiculous suggestion it was possible for a body of sensible men to take. Surely great benefits can be conferred upon the community in general in other ways besides reducing the rates. By-the-by, no one suggested that no more consumers should be taken by the Gas Department, who are under the same conditions as to profit-making.

In dealing with "cost price" it is difficult to convince a Council that the *average* price is not the cost price of electricity. Owing to this the non-manufacturer too often jumps to the conclusion that manufacturers are supplied below cost when the power rates are low, and low simply because the hours of use are long. It is unfortunate that none of the published tables give particulars showing the price for lighting and power separately. It is the absence of such information which renders it necessary at times to instruct one's engineer to send out a "catechism" to which sarcastic reference is occasionally made without much ground. It surely does not take long to give information, probably from memory, and the interchange of particulars of different works is especially valuable as a guide to members of committees who like to know what other municipalities are doing in such matters.

In portions of Stoke-on-Trent area, large power users get supply at ½d. per unit. This figure is sufficient to cover the cost of generation, but it does not allow for sinking fund and interest on mains. In the writer's opinion, the charge should be compounded of cost of generation added to the cost of distribution (which will vary according to the distance of the consumer from the works) just as a manufacturer quotes goods "F.O.R. his works" at one price and "delivered" at another and higher rate. Restricted hour supply for all purposes and at 1d. has been given in one of the writer's districts since March, 1906, and has met with encouraging success. Ordinary manufacturing works cannot cut off at 4 p.m. in winter, but there are sufficient users to justify the special rate, which is only given when a clock-controlled switch is provided by the consumer.

Showrooms.—The writer does not know what is the general experience of electricity committees as to the utility of showrooms, and he introduces this phase of the question with a view to eliciting opinions on the matter. His committee are, generally speaking, antagonistic to the use of showrooms. His own opinion is that, given a fairly large district to work in, a good showroom is a necessity to the success of the electricity undertaking, provided that it is kept up to date so far as general things are concerned, and also with all new novelties in electrical utensils. But, added to that, there should be in charge of the rooms an attendant fully conversant with all matters affecting supply, light, power, heating or cooking, and able to explain very fully the merits or demerits of any particular article or methods of using such article. Given all this, then, he feels confident that a showroom in a central position can be made a very useful adjunct to the electricity undertaking.

Taking smaller areas, the best method of getting consumers, and increasing the output at the works, is to employ a canvasser who can watch new property being built, wait upon the builder and explain the good qualities of electricity for lighting purposes in ordinary dwellings, and who should be thoroughly conversant with every phase of the question, and be able to put the case in such a way as must result in new customers. Personally, he would only employ for these positions the very best type of man it is possible to get, as everything in such cases depends on this.

A great deal can be done in the direction of canvassing by cordial co-operation between the local contractors and the Corporation. In Hanley some six years ago an attempt to work together was made which has succeeded beyond expectations. The contractors were given supply at 1d. per unit, all Corporation wiring is done by them, and they are lent any apparatus required for demonstration, while in special cases they are paid a commission. As a consequence, the electrical industry is in line and pulling together without friction and with advantage to the community.

Domestic Uses of Electricity.—Stoke-on-Trent has done a little in the direction of cooking appliances, and for some time has given this class of supply at 1d. per unit, but the trouble has been to obtain reliable and substantial stoves at a reasonable price. The £5 ovens are flimsy articles, while if £10 or more is paid the hiring rate is much in excess of a gas stove. The ordinary domestic user will not pay more than 2s. or 2s. 6d. per quarter. The cost of operation is low;

Digitized by Google

in small houses, a Sunday's dinner for three or four persons can be cooked for 2d.

But there is one objection; in very few areas are the mains large enough to stand a row of houses taking on electrical ovens without trouble with the supply, and the additional mains necessary pile up the capital charges on the undertaking faster than the revenue from this class of business increases. In a district where the lighting supply was quite satisfactory, new houses were built and these were got for electric cooking, with the result that several hundreds of pounds had to be spent on mains to keep up the voltage.

Tenders.—One of the most puzzling things coming before an electrical committee is the question of tenders; and in a recent case of two turbo-generators one of the most peculiar things was that although the tender form gave all the conditions couched in the simplest language, and the contractor had sent in a price for the particular article, there is nearly always a covering letter to the tender, which, while accepting the conditions laid down in the tender form, suggests modification of this, that and the other, which, if agreed to, sometimes would almost alter the whole construction of the article in question.

DISCUSSION.

Councillor J. W. CROWTHER (Sheffield) did not agree with the policy of reducing the rates by means of the profits of the electricity undertaking. Adequate allowances needed to be made for sinking fund, interest on capital charges, &c. When engineers found money for the rates they were expected to do it regularly no matter what was the condition of the undertaking. Engineers should endeavour to get the maximum number of consumers at the minimum of cost. In Sheffield the power load had been increased, and the cost of production reduced from 4d. to 0·48d. per unit. He thought that in regard to the contractor they were a little too squeamish. He created much amusement by describing the average contractor as a draper who took to electricity as a side line. Showrooms he considered were usually on too modest a basis, and should always be in a main street. Some engineers hid the showroom "behind the power house." The small consumer should be encouraged, and it was better to get a man to put in a few lamps at first rather than more than he really wanted. Engineers needed to get in the £20 a year rental class of consumer, who usually paid. At present it was difficult to compete with gas on the score of fittings which were generally supplied free of cost, and only the labour of erection was charged. Electrical engineers were sorely in need of powers to put in stoves and ovens.

Mr. C. O. MILTON (Maidenhead) asked how the cooking load could be encouraged in very small towns where the mains were initially installed of small area, say 0·1 sq. in.

Mr. F. AYTON (Ipswich) took Councillor Leese severely to task in abrogating to himself, as he thought, the duties of chief engineer. Complaints should never be made to the Committee, but always to the engineer. If Committee men were addicted to asking a large number of questions he recommended that they be referred to the consulting engineers, who might be paid a reasonable fee for the advice given.

BAILLIE WILLOCK (Glasgow) in an amusing speech considered that the position of chairman of an Electricity Committee, far from being a thankless one, was a high honour—at any rate he felt it so. In Glasgow complaints seldom filtered through to the Committee. The men had a right of appeal to the Committee only after their complaints could not be settled by the engineer and his assistants. Much laughter followed the Baillie's remark that they had no consulting engineers in Glasgow. "We've had 'em and been without 'em, and know which is better." It was bad for consulting engineers "Glasgow way." The consumer had been encouraged in Glasgow of recent years, and since the Smoke Abatement Exhibition a flat rate of 1d. per unit had been in vogue for cooking and heating.

Mr. S. E. FEDDEN (Sheffield) endorsed the opinions expressed that the rates should not be subsidised from the profits of the undertaking. Nowadays the Local Government Board enforced such short periods for the repayment of loans that large profits could not be made. Taking his own undertaking, he had formulated a balance sheet to indicate the conditions under company working. It showed 5 per cent. on the preference shares, 4 per cent. on debenture, and 9·4 per cent. on ordinary shares, omitting sinking fund, interest, &c. He thought that Councillor Leese's undertaking with a load factor of 45 per cent. and ½d. a unit costs, should be able to allow for interest and sinking fund. Mr. Fedden was very emphatic on the matter of tenders. He strongly deprecated the practice of covering letters with tenders. The wording of many of these amounted almost to sharp practice, and he thought that contracting firms should send in "straight" tenders.

Alderman G. PEARSON (Bristol) thought that there was little chance with the Local Government Board short loans of an undertaking being mulcted on behalf of the rates, unless the price for energy was abnormally raised. A good reserve should be built up, and no profit shown, the surplus being used to reduce the price of energy to power users. In Bristol it was necessary to cut prices for power in order to compete with steam and gas. The undertaking ought to be at liberty to do what it liked with its profits, and not bound by Act of Parliament in the matter. As far as covering letters with tenders were concerned he thought the real difficulty was to get the contractor to complete the work to time. Covering letters could easily be ignored, but delivery was quite another matter. Complaints should always come to the engineer, and not to the Committee.

Councillor W. F. GOOD (Maidenhead) thought that the profits should be divided equally between (1) the reserve fund, (2) the reduction of charges to consumers, and (3) the reduction of charges for street lighting.

Baillie W. B. SMITH (Glasgow) spoke of the Smoke Abatement Exhibition and a subsequent commission at which Mr. John Burns was asked that the Government take steps to protect municipal undertakings which served a public purpose from the practice of taking their profits for the relief of the rates. Much harm was done by this practice in keeping up the price of public commodities like gas.

Mr. MILES WALKER (British Westinghouse Co.) thought that a misunderstanding was created by the remarks in which Mr. Leese was accused of assuming the duties of the chief engineer. These remarks reflected on Mr. C. H. Yeaman, and it was only right to say that there was no question about Mr. Yeaman having absolute authority, and that his relations with the committee were of the best.

Alderman F. W. SMITH (Liverpool) said that the ratepayers had a right to be considered in all municipal undertakings, and that when the rates could be relieved they should be. That was the practice in Liverpool. He disagreed with Mr. Good on the point of allocating part of the profits for street lighting. His remarks that the electricity department should not do the street lighting brought forth a chorus of groans.

Councillor LEESE, who reserved his reply for the proceedings, said that in blending the interests of six such districts as the Potteries towns there were naturally difficulties and acrimonious feelings to overcome. Answering a question as to the supply for cooking and heating with only one meter, the practice was to strike an average of the consumers' price paid over say two years, charge him this, and a 1d. per unit consumed.

After a hearty vote of thanks had been passed to Councillor Leese, Mr. Beauchamp read his Paper on

MODERN WIRING PRACTICE.*

BY J. W. BEAUCHAMP.

(Chief Electrical Engineer, Tunbridge Wells.)

Summary.—The author first discusses wiring regulations, and suggests that these should be as simple and light as possible, but that their enforcement should be more stringent. He proceeds to analyse the various existing regulations, pointing out the desirable features. Finally, cheaper wiring methods are discussed, the costs of various systems being tabulated.

During the development of the public supply of electricity, the attention of engineers has been exercised by a number of leading problems. First there was the design of plant and the economies of production. At a later period the question of tariffs attracted much attention, and continues to do so, although possibly its ultimate solution is now within sight. More recently, educative and publicity work has been the subject of study; but the growing experience of the public with regard to the cost and advantages of electricity supply is easing the work of the business-getting departments and bringing the supplier rapidly to the last barrier which must be overcome before the use of electricity can become general. That is the difficulty of introducing electricity into premises where, on account of cost, there is a disinclination to instal the necessary wiring and fittings, although the supply may be desired and its economy well understood.

Doubts have been expressed as to the probability of small consumers being remunerative; certainly such business is of a special character, but on account of its possible magnitude and the comparatively high load factor of lighting supply to private houses it deserves special treatment, more particularly as the growing demand for electric street lighting makes it necessary to lay cables in roads where only the smaller consumer can be obtained. The extent of this potential business is emphasised by returns which show that the proportion of premises taking electricity supply varies roughly from 5 to 25 per cent., according to the character of a community, age of the undertaking, competition, &c., whilst the percentage of houses rented at less than £30 per annum ranges from 40 to 70 per cent. of the total.

The great bulk of this lighting business can be obtained in time either by means of prepayment meters, contract rates, or the usual monthly accounts, according to the class of consumer; but the premises must be wired in exchange for a slightly increased supply rate, or on very simple and easy hiring terms. This is largely, but not wholly, a problem of policy and finance for the supplier; a suitably designed system of wiring would do much to assist in its realisation, and it is the object of the writer to draw attention to, and, if possible, to cause discussion of, the features of modern wiring practice and regulations insofar as they influence the cost of small installation work.

Wiring Regulations.—Although the I.E.E. Rules are adopted by most supply authorities there still remain so many exceptions and amendments that no real standard can be said to exist, and there is great lack of uniformity in the quality of electrical installation work

* Abstract.

Digitized by Google

within any particular supply area, regulations being observed in the better class work and evaded or only complied with in a perfunctory manner where competition brings down the price of wiring. Against this tendency the supply authority can only struggle with difficulty as the general run of small house and shop wiring usually falls to the lowest tender, and in many cases there is not the most elementary form of specification to ensure that the several offers are based on the same requirements.

To enforce regulations in detail without obstructing work and progress is a comparatively expensive matter, requiring experienced and conscientious inspection and a decided sense of proportion on the part of the inspector. The proper course appears to lie in drafting simple and definite rules dealing with (1) safety of the consumer, (2) non-interference with the proper working of the supply to other consumers. The requirements of these regulations should be made as light as possible, but the enforcement of them should become more stringent.

A change in this direction should secure greater uniformity of work, tending to lower the cost of high-class wiring and force up the quality of the lower-class work.

Many of the existing rules are directed towards securing for the consumer a well-designed installation, with regard to capacity of conductors, sectionising, &c. As these cannot be enforced, and their value depends so much upon individual circumstances, they would be better eliminated from the category of "don'ts" and issued by the supply authority in the form of simple model specifications describing the requirements of good practice suitable for several different classes of wiring work. Such official specifications would in the writer's opinion do much to render practice and prices more uniform, and allow contractors to cultivate different classes of wiring work in accordance with their inclinations and capacity.

In any case, in view of the rapidity with which electrical practice changes and the fact that so much of our work is secured in competition with other systems of light and energy supply, it is undesirable that wiring regulations, however simple, should be administered in an inflexible manner, or pass under the control of any centralised body not directly interested in the commercial development of the supply undertakings involved.

The author gives a brief analysis of the regulations of a number of British and foreign authorities controlling or advising upon electrical work. This shows how great a divergence exists in their requirements, and suggests that, even after allowing for climatic differences and local conditions, the cost of wiring must be affected considerably by the varying limits imposed.

Insulation Resistance.—The usual insulation resistance test depends more upon the dryness of the building and the care used in connecting up fittings than upon the actual resistance of the dielectric, and a fair result may be obtained from wiring which has suffered considerably by careless workmanship and may be doomed to early failure. For these reasons a much lower insulation resistance than is usually called for would suffice, but should be supplemented by inspection of samples of hidden work in every case.

Limits of Capacity of Branch Lighting Circuits.—It would appear that the true limit lies in the ability to make proper current carrying connections in the various "loop-in" fittings used on branch lighting circuits; 10 amperes should be a workable maximum.

The limit of motor capacity which may be connected to one side of a three-wire system should depend upon the capacity of the system: in some cases most stringent regulations are issued by very large undertakings.

Motor Starting Currents (Maximum).—This regulation would be better stated in "limiting amperes" for any motor on a system or district according to capacity of cables or transformers—because having admitted, for example, a 10 H.P. motor at 1¼ times full-load current (say, 70 amperes), it is hardly reasonable to deny the users of smaller motors in the same district the privilege of taking the same value of starting current if by doing so they can be put to expense or their gearing simplified.

Limits of Pressure Drop at Full Load.—This provision is suitable for a specification to secure the use of cable of ample size, although where possible actual sizes to be used should be stated. Provided the wiring is not dangerously overloaded, the question of pressure drop concerns the consumer chiefly, and the increasing efficiency of lamps does not warrant the use of heavy wiring. The most striking difference between British and German wiring regulations lies in the permissible loading of cables.

Amongst several provisions which now seem curiously out of date are the following: Motors to be insulated; no installation to have more than two branch circuits; no copper fuses to be used; S.P. switches to be used on each main; meter shunt wire to be taken to lamp side of consumer's main switch; slip conduit prohibited; metal conduit to be avoided if possible.

A few, however, are conspicuously in advance of the period when they were written—for example: Bath-room lights to be out of reach of persons in water; tubes and frames to be continuous and well earthed to water pipes; no elbows to be used in conduit; no single wires to be used, and none less than 3·22's; the use of key socket holders to be restricted; internal lighting fittings to be insulated; meter main coil and all S.P. switches to be on live side of supply.

Several regulations in the more modern codes could be made general with advantage, *e.g.*: Electric irons to have some indicator showing when current is on. Capacity of cables for motors to be calculated on basis of short period overload ratings, and on basis of starting currents. Key socket holders in groups of not more than eight to be controlled by one separate switch. (One lamp of each group might have a plain holder when the burning of that lamp would indicate that the control switch was "on.")

In addition, a distinct definition of current carrying capacity for switches and fuse fittings is needed—most modern patterns fulfil every requirement with regard to breaking circuit, but are greatly overrated so far as concerns their power of carrying full load current continuously.

Earthing Regulations.—The rules mostly fail to define the essential requirements for security from risk of shock or fire, which are that every part of a metallic sheathing or conduit system containing conductors shall be permanently connected to earth by a conducting path of sufficiently low resistance to carry, without sparking or heating at any part of system, the maximum current which the main fuses of the installation will pass.

The earth wire, also, whilst requiring a definition of minimum size for reasons of mechanical strength, should have a stated size depending on the capacity of the installation; the minimum might be No. 18 S.W.G., No. 14 being unduly heavy and expensive for use on small installations; and, beyond this, the sizes used should bear a relation to the main fuses, or circuit breaker setting, of the system protected, being selected to carry the full current required to open the circuit without appreciable rise in temperature. Where local circumstances require the earthing wire to be of considerable length, its area should be proportionately increased:—

As an example of safe practice—

For all lengths up to 20 yds., and current up to 50 amperes, No. 18 S.W.G.

For all lengths up to 20 yds., and current up to 100 amperes, No. 14 S.W.G.

For all lengths up to 20 yds., and current up to 250 amperes, No. 12 S.W.G.

The connections between metal-work and tubing and the earth wire also need to be of low resistance and permanent character. Tests made with lamp or bell for the continuity of a tube system give little indication of the current-carrying capacity of the many joints and connections through which a fault current would have to be discharged, whilst the accidental earthing of the tube at one or more points, by contact with structural metal work or water pipes, may make such a test quite deceptive.

Earth connections should be made to the rising service pipes of town water systems, water meters being bonded across, or to metal plates buried in the earth in some position where natural dampness exists.

Where the system of wiring makes it impossible to render all metal-work of motors, lamps and other apparatus metallically continuous, it is advisable to run throughout the installation a substantial and visible earthing wire or tape, to which all apparatus can be connected, and to earth connect it at one point. This connection can be tested at intervals from different points of the installation by taking an ammeter reading between it and the live poles of the wiring through a small known resistance. The readings will show up any change in the state of the earth connection and prove its energy-discharging capacity in a way which tests with a bell or lamp do not do.

Where these methods of earthing are not possible it is necessary to resort to devices of the lightning arrester type, of which the Cardew & Partridge appliances are probably the most used—in these a small air gap is maintained between the outer, neutral or earthed pole of the system, and a connection which includes all tubing, frames and metal-work; in the event of the latter rising in potential beyond a certain limit the air gap is bridged by a spark or by electrostatic attraction of a light metal armature, and a short-circuit results, opening the fuses or circuit-breakers. The devices have the drawback that they will not operate with certainty excepting for pressure rises of considerable amount and so do not altogether avoid risk of shock; they are of more particular value on high-tension systems where good earth connection cannot be obtained.

Digitized by Google

It is desirable to avoid connection :—

To girders and constructural ironwork, which is often insulated by concrete, and even if it appears to be well earthed, may be so through gas or other pipes making variable contact, and subject to removal.

To gas pipes of any kind.

To hot water and hydraulic supply pipes, as they are often jointed with imperfectly conducting material or are only connected to a water supply system through a tank and ball-cock.

To water pipes drawing supply from cisterns fed by ball-cocks, or from wells, as the connection may be broken by lowering of the water level below the delivery or suction pipes.

To other earth connections provided for telephones or bells, as these may increase in resistance or provide an alternative path through the instruments to other earths.

Earthing in positions which may receive sewage or corrosive waste liquids is not to be recommended, and drains and gulleys although full of water often afford a very indifferent connection to earth, owing to the insulating character of the concrete or earthenware of which they are built.

The increasing stringency of Home Office Regulations has led to the production of various fittings designed to fulfil them. These new designs appear to fall into two classes, one in which provision is made for earth connecting all metal-work, and the other in which insulating material shrouds all parts from which a shock might be obtained as a result of failure of internal insulation. When substantially made the latter class probably has the advantage—as its efficiency does not depend upon the condition of a more or less elaborate system of earthing wires, and damage to the insulating shields can be at once seen and remedied.

These precautionary measures are looked upon by many contractors as vexatious, the cost and trouble involved in meeting them is resented, and it becomes a matter of some difficulty to ascertain with certainty that a tube system, much of which is normally out of sight, has been made capable of safely clearing a fault which may arise in any part of it. In short, if the letter of the Regulations is observed, the cost of the cheaper classes of tube work is increased ; on the other hand, if, as is usual, installations are accepted for supply on the strength of a few visible connections between the tubing and a convenient water-pipe, the combined shock and fire risk, small as it obviously is, is distinctly greater than it would be if no earth connection were provided.

In an ordinary house wired with slip-joint tube, a leakage current occurring at any point at all remote from the service entry will probably have to run the gauntlet of sundry loose connections under floors and behind lath partitions on its way to earth. Undoubtedly these considerations present one of the gravest objections to the simpler systems of metallic conduit. Some device is needed to protect concealed wiring mechanically without involving the danger of spreading a leak, or the difficulty of furnishing a completely earthed sheath. Steel tube has much to recommend it on the score of protection for wires and low cost of erection, and has done much to encourage the wiring of small houses during construction for which purpose it is very suitable.

It would seem worth while to consider the extension of the principle of I.E.E. Rule 46 (1907 Ed.), earthing only portions of tube within usual reach in wet places, and keeping the remainder in isolated single lengths by the use of fittings and sockets which actually insulate instead of partially connecting as at present ; this could be effected by lined sockets or by serving the outside of the tube with compounded tape or braiding—a similar process is used for the protection of iron gas and water mains on the Continent, and would not increase the cost of the conduit appreciably, whilst protecting it from rust and destruction by ash concrete and plaster.

The principal weakness of the earthing precaution lies in the fact that it is not essential to the working of the installation, and the wires and joints upon which it depends may suffer damage without the fact being revealed until they fail to give the expected protection.

Conduit.—Condensation trouble is only serious where runs of conduit are subject to different temperatures, as in passing from living rooms to cellars and outdoor positions, and can, to a great extent, be prevented by providing drain holes at lowest points and by the use of inspection boxes well filled with slag wool or similar non-conducting substances at points between which considerable temperature difference may exist.

Corrosion in buried conduit is generally the result of condensation which, particularly with "close" joint tubes, permits surrounding plaster to become moist and chemically active ; this is very noticeable with plaster or concrete made from ashes. The use of "close" joint tube in any form of cement or plaster is undesirable, but difficult to prevent on jobs where brazed or seamless material is not insisted on throughout. There appears to be a useful field for a conduit lapped with coarse tape or jute and compounded outside for such positions.

The first test of a good class slip conduit lies in the inter-changeability of the tubes and fittings and the possibility of making firm metal to metal joints at all points after removing the enamel. One of the reasons for using inferior conduit on low-grade work lies in the fact that fittings are an easier fit and more rapid erection is secured at the expense, of course, of continuity. Various devices have been put upon the market to enable slip tubing to be made continuous without appreciable increase in cost. For the most part however, they introduce difficulties in use and are always apt to be omitted where tube is fitted in awkward positions, whilst their weakest feature is that they do not render it necessary to remove the enamel from the tube and sockets, and are, therefore, inferior to accurately made plain connections which cannot be socketed home until the metal is cleaned and some force employed—in some instances slip tubing has been put together with wet salammoniac in order to secure a rust joint, an injurious practice, owing to the corrosive and hygroscopic nature of the salt. There seems to be no reason, however, why a useful amalgam like jointing mixture should not be made, similar in composition to aluminium paint or the past solders.

Safety.—One of the greatest safeguards for the consumer lies in the use of correctly proportioned fuses, and, where possible, the cartridge form or the modern development of the old Edison screw plug fuse such as the "Zed" and "Dial" fuses, should be used, but the cheapness and convenience of the ordinary porcelain bridge fuse will prevent it from being easily superseded ; it is, therefore, desirable that consumers should be provided with simple information with regard to fusing.

The supply authority could well take this matter up by using printed cards to be fixed by the service cut-out and the distributing boards stating the usual fuse sizes rendered in terms of lamps and wire gauges.

Influence of Voltage Reducers on Installation Work.—The use of pressures has not apparently made much difference to wiring practice, nor has it become general to use material of lower insulation quality on new work where pressures of 50 to 100 volts are intended. If, however, the makers should produce a high-voltage lamp of small power and low price the transformers would presumably be abandoned in time, provided that the wiring were found suitable for the higher pressure, and here, in the writer's opinion, lies one of the advantages of the general use of pressure reducers on new work although the material may be of the usual H.V. quality the low working pressure tends to prevent faults, due to bad workmanship and careless handling of wire, from showing up as they would do on the usual supply pressures—a condition likely to lower the standard of installation work and give trouble in the future if reversion to higher pressure takes place.

In any case, where low insulation work or earthed concentric wiring is put in on the strength of the installation being separated from the supply network by static or rotary transformers, it should be made clear to the purchaser that he is possibly committed to the continual use of such transformers, or disappointment may arise in the future.

Small transformers are responsible for a considerable number of faults on consumers' premises, particularly where their cores or frames are connected to earth. It is somewhat unfortunate that suppliers have not endeavoured to keep control over house transformers by a rental system, which would have done much to keep up quality and avoid troubles which have arisen from improper selection of voltages, errors in connection, and waste through excessive magnetising consumption.

It is interesting to note how the general use of the house transformer affects pressure regulation, interposing, as it does, on alternating-current systems another link between the generator and the lamps which is susceptible to loading. The pressure regulation of small transformers varies from 2½ to 4 per cent., and as they are seldom fully loaded, excepting in works and business premises where some care has been exercised to suit the capacity of the transformer to the normal load, it follows that the average working pressure is raised somewhat at all times, particularly during off peak hours, and the cumulative effect of light load on cables, main and house transformers often results in such lamps as are in use being considerably overrun.

Lamp Holders.—The familiar bayonet pattern lampholder is contrasted with the foreign screw socket to the detriment of the former, chiefly on the score of poor conducting power and damage by overheating ; it is questionable, however, if it suffers from such faults to a degree which would warrant the expense and trouble attending from a general change on the part of makers of holders and lamps.

It is often contended that a screw socket may be used for flat-irons and other apparatus taking up to 10 amperes ; but the screw holder is not altogether ideal when used for any large apparatus on a fle

Digitized by Google

cord, as the cord is twisted in screwing up, and heating apparatus of any size is almost always connected up with plug-sockets and will probably continue to be so. Yet another point in favour of the B.C. holder is that both poles are well enclosed and covered by the lamp; with the screw socket the lamp cap, which can often be touched, may be alive if care has not been taken to keep all the centre contacts on the switch or "live" wire.

Cheaper Wiring Methods.

Concentric Systems.—The most important recent development in wiring appears to be the re-introduction of the concentric principle in the form of the "Stannos" wiring system. Where it is possible to work on the surface of a building and use concentric conductors with the outer or return sheath earthed, a saving in cost of 10 to 15 per cent. over slip joint conduit wiring can be secured.

Its chief disadvantages appear to be: The multiplication of mechanical joints or points where loose connections may occur. The difficulty of securing to plaster and composition walls and ceilings. Comparatively feeble resistance to accidental damage. Risk of loss of continuity and consequent sparking or pressure rise on the outer conductor in the event of loose contacts or breakage of sheathing.

These difficulties are rather matters of detail and many of them can possibly be overcome. As the superior economy of this system over conduit is only apparent when the wire is used concentrically, it has so far been most successful on alternating supplies, where the use of a transformer affords a ready means of isolating the consumer's wiring from the supply network; as such transformers may also be used to reduce voltage, their cost is not altogether chargeable to the concentric wiring. Where, however, it is required to use double Stannos wiring, the outer sheaths acting merely as a mechanical protection, no trouble arises from inductive drop with ordinary sizes and currents. The great value of this material lies in the fact that faults quickly develop into short-circuits and put the bad section out of use, whilst repairs are easily carried out; in addition, all the simplicity and advantages of a single-pole system are secured.

Flexible wiring has been much discussed from time to time but no effort made to define its utility or to establish any regulations which might make it safe for certain classes of work without rendering it too expensive; in consequence a considerable amount of such wiring is actually in use in this country, the material being used in a most improper manner and only saved from failure by its high quality. Some attempts have been made to produce a strong and safe flexible wire, the result being usually rather clumsy and as costly as the cheaper forms of permanent wiring. There would appear, however, to be a field for such material in connection with heating circuits—a heavy armoured and fairly flexible cord to carry up to 10 amperes without overheating, and provided with good plug terminal fittings and fuses of the cartridge type, might reduce the first cost and consequent difficulty of inducing users of electric light to put in heating and cooking apparatus; such wiring could also be a tenant's fixture capable of removal to, and use in, other premises.

A disadvantage peculiar to all fixed surface wiring systems lies in the difficulty which is met with when re-decorating walls and ceilings, particularly when papering; this fault is sometimes lost sight of by those who advocate such systems on the grounds that existing decorations will not be injured.

Cost of Wiring Small Premises.—The influence of the system adopted upon cost is indicated by the following figures, which, although actually variable according to circumstances, are relatively representative of the principal methods available for wiring small houses. Examination of these figures also brings out the fact that on the cheaper systems labour costs become a much smaller proportion of the total, suggesting that it is only under some organised scheme of wiring houses in quantity, such as might be arranged by a supply authority, that the fullest economy of these methods can be realised.

This Paper was prepared before the publication of the 1911 edition of the I.E.E. Rules, but the writer was able by the courtesy of the Institution to inspect a copy. He finally draws attention to the principal changes in the Rules, in so far as they affect small installation work. The alterations of most interest are contained in the table of carrying capacity of cables. Although the new limits for $\frac{1}{18}$, $\frac{3}{22}$, $\frac{3}{20}$, and $\frac{3}{18}$ cable are only about 60 per cent. of the values allowed by the C.D.E., they represent a great practical advance, and should reduce wiring costs whilst allowing a good factor of safety against increase in loading which might take place after an installation has been put into service.

Relative cost per light of wiring in small private houses complete with metal lamps and simple pendants.

Discussion.

Mr. S. E. Fedden (Sheffield), in opening the discussion, said that in Sheffield gas was very cheap; nevertheless, the big houses could be got on the mains if not piped for gas and if the wiring could be done during the building of the house. He had hopes of getting the £20 a year houses if the builders could be got to notify the department of work being done. While he did not advocate jerry work he thought that the ideals of the wiring rules would have to be dropped in future. In small, dry houses the wires could be run through the joists without casing, and down the walls slip joint tubing was quite satisfactory. As to contractors, he felt that it was more and more necessary for the supply authority to deal with the consumer direct. The supply authority's interests and those of the consumer exactly coincided. The contractor, who was often a mushroom man, wanted to instal as many lamps as he could. His mistakes had to be remedied by the supply authority; in any case the electricity department was always there, and could be better looked up to for advice than a contractor who was here to-day and gone to-morrow. He thought that voltage reducers (auto-transformers) had had their day, and the future was with the 200-volt lamp. He knew of cases where the bills of consumers were heavier with than without voltage reducers, because of the magnetising losses. As to Stannos, his chief criticism was that it was too expensive. He thought that the makers could halve the price. In a certain case he found that wood casing with 600 megohm wires worked out at £35 and Stannos with double-wound transformer (one to one ratio) was £42. 10s., Simplex steel-armoured "flex" being £41. The labour was certainly reduced by 25 per cent., but the cost was 70 per cent. more for material. He still looked for a good substitute for slip or screwed conduit.

Mr. F. M. Long (Norwich) said that with 14 years' experience of free wiring they had been successful with wires run through the joists and in tubing on the face of the wall for the switch wires. He thought that most of the troubles were due to electrolysis caused by damp, and not by overloading of the wires. If proper care was taken in damp places to protect the system against the entrance of moisture then there should be no difficulty. As to flexibles, pure rubber was better than vulcanised, and though a little more expensive was better in the long run.

Mr. W. A. Vignoles (Grimsby) said that the author had not said enough about wiring on easy terms. He asked for further information. Money should be raised for free wiring, and he hoped that the Council of the Association would promote a Bill for that purpose. Speaking of slip-joint tubing he thought that it was not good because the clips were often left out at inconvenient places. In Grimsby, wiring through the joists was done, and single lead-covered wires used; down the walls these wires

Digitized by Google

were drawn into tubes in plaster. He advocated a greater use of the auto-transformer on alternating-current systems, since the cost of the wiring could be reduced and it was safer to use a pressure of 25 volts in a house.

Mr. F. Ayton (Ipswich) considered that wood casing was still the best system if means were taken to keep out the damp by the use of water-proof paint. Flexibles were certainly a weak point, and money spent on them was well spent. He advised that steps be taken to rate switches on a voltage and not on an ampere basis. The holes in ceiling roses and switches needed to be standardised as to their position and centres in the base. When changes had to be made, the new fittings did not agree with the old ones. Both these matters he thought should be taken up by the Engineering Standards Committee through the agency of the Council of the Association. The same remarks applied to wall plugs.

Mr. Cridge (Electrical Co.) asked that engineers should maintain a high quality of insulation in all wiring work, and that when tests were made a qualified man should be sent and not a youngster with an exaggerated notion of his own importance.

Mr. A. E. Woodhouse (Woodhouse Steel Casing Co.) points out (in a written communication to us) that owing to the diverse opinions of engineers on wiring questions he had endeavoured to evolve a system embodying the good points of the various existing systems. He claimed that the Woodhouse steel casing had almost the flexibility of the cleat method, and after the installation was finished, the consultant could inspect everything, including the wires at any part. The conductors were simply installed as in wood casing, and when the covers were sprung on, they were protected throughout by steel as in tubing. Continuity was obtained by assembling the parts together without using special bonding pieces. Finally, the system was neater than others.

At the conclusion of the discussion on Mr. Beauchamp's Paper members adjourned for luncheon.

In the afternoon a large number of the members drove out to the Southwick power house of the Brighton Corporation. A description of the plant appeared in our last issue. Through the courtesy of Mr. Cash, the enterprising manager of the gas works of the Brighton & Hove Gas Company, a number of engineers took advantage of the invitation to see the works and were very interested in what they were shown. The invitation may be regarded as indicative of the friendly feeling existing between the two undertakings in the district. It is a spirit which is not always met with where the undertakings are respectively company and municipal owned.

The evening was spent in a most enjoyable manner at a conversazione given to the members by the Mayor of Brighton. An interesting precedent was established in the shape of a dance which was held after the reception. A most brilliant effect was produced in the elaborately decorated ball-room.

Portsmouth, Wednesday, June 28th.

Members had to be early astir this morning, a special train leaving for Portsmouth, where to-day's proceedings centred, at 8:30 a.m.

The party reached Portsmouth a little before 10 a.m., and at once proceeded to the Municipal College, where the Mayor of Portsmouth, Alderman T. Scott Foster, officially welcomed the Association.

The meeting took place in the Lecture Theatre, and the Papers under consideration were regarded as the most important at the present Convention.

The President first called upon Mr. H. L. Howard to read his Paper on

INTERNAL COMBUSTION ENGINES WORKING ON THE DIESEL PRINCIPLE.*

BY H. L. HOWARD.

(Chief Electrical Engineer, Barking.)

Summary.—After describing the features of Diesel engines, the author considers the question of oil supply. The cost of operation is next considered, the various items—fuel, labour, repairs and maintenance, &c.—being discussed separately. Taking the existing installation at Brighton as an example of a steam-driven station, the first cost of corresponding stations equipped with Diesel plant and gas plant are given. The Diesel installation shows to advantage in this case, as well as in a number of figures given for Continental installations. The use of Diesel engines in sub-stations is recommended, and the author expects striking developments in the next few years.

The internal combustion engine working on the Diesel principle, has, during the past few years, received considerable attention from engineers in charge of power stations, and although at the moment only sets of moderate size are at work or in course of construction (sets from 1,600 B.H.P. downwards), the great economy that has been obtained where they have been adopted has interested engineers connected with the larger undertakings to such a degree that within the next few years there will undoubtedly be some striking developments in the installation of high-power Diesel engines. Although very fine figures are being put forward for both steam and gas plants, yet in the author's opinion these can be greatly improved upon by the adoption of Diesel plant.

The standard Diesel engine of to-day is a single-acting four-cycle engine, and, unlike the gas engine, is not an *explosion* engine, for at every working stroke the fuel burns steadily as long as it is injected into the cylinder. No explosive mixture exists in the cylinder before the beginning of the working stroke, the compression in the cylinder being that of air alone. The volume of air drawn in is constant and is always sufficient to burn completely the maximum quantity of oil required at full load. The quantity of fuel injected varies with the load and is delicately regulated by the governor, there being no "hit and miss" method.

The compressed air used for the injection of the fuel oil is stored in a steel air bottle, at a pressure of about 800 lb. per square inch, which is kept automatically charged with air by means of a two or three-stage compressor, worked direct from the crank shaft. There are also two other air-bottles used for starting the engine.

A departure from the standard engine is that put upon the market by the Nederlandisch Fabrik of Amsterdam. This engine is fitted with a cross-head and guide, and has a comparatively short piston. It is also provided with a distance piece between the cylinder and

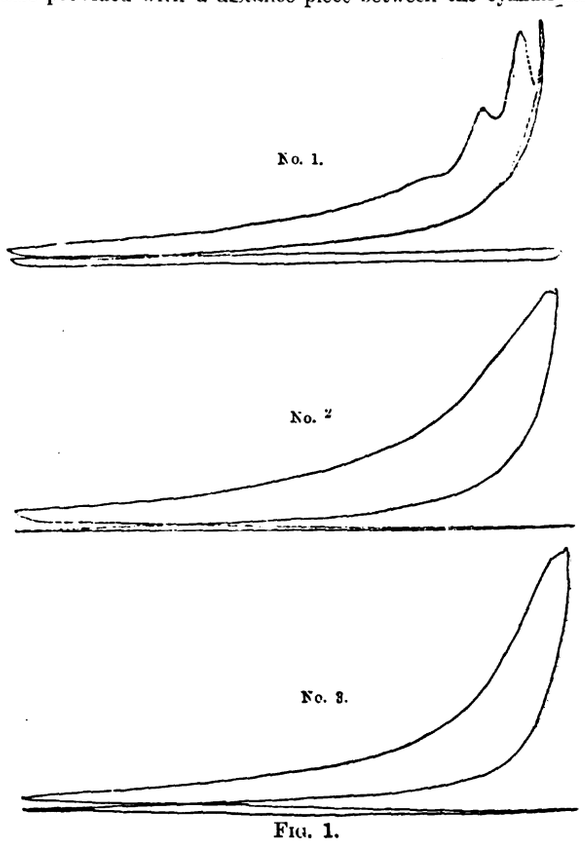

Fig. 1.

the crank chamber. The makers claim several points in its favour and, in the author's opinion, for high-power vertical engines it is the line that will eventually be followed.

One of the most interesting examples of high-power Diesel engine is the installation at Halle, where two 1,600 B.H.P. sets of the horizontal double-acting, four-stroke type, constructed upon the line of the Nuremberg gas engine, have recently been started up.

Fuel.—The answer to the usual questions as to the price of c fluctuating within wide limits and as to a reliable and continuou supply, is that, as petroleum is found in so many parts of the worl and as many new oil-fields are being opened up, it is obvious by th common law of supply and demand that the above factors cann vary over very wide limits, and any such variation should compa favourably with the variations in coal.

The oil fuel most generally used is the residue from crude petr leum, after the lighter spirits and oils have been distilled, and commonly known as "petroleum residue." This oil runs about 2 gallons to the ton, and is generally either Texas or Roumanian c As regards price, the author has recently fixed up a contract on beh of his Council, for a supply up to Jan. 1, 1913, at 37s. 6d. per t delivered into tanks at the Electricity Works, Barking.

* Abstract.

NOTE.—The period covered is in all cases 12 months, except Letchworth, for which it is five months.

Another factor is the possibility of using the by-products from gasworks, viz., gas-oil tar, and gas-tar oil. The former is the by-product from carburetted water gas plants, where gas oil is used to enrich the gas for illuminating purposes. It has a calorific value of about 16,500 B.Th. U. per lb., and is being extensively used on the Continent. The latter is the by-product from the distillation of gas tar. The author recently made a careful inspection of some plants using gas-oil tar, including a large double-acting tandem four-cycle engine, and a twin-cylinder horizontal two-cycle engine, the sets working with a 10 per cent. addition of crude petroleum—and was perfectly satisfied as to the practicability of using such fuel; so much so, that a 600 B.H.P. engine is now being built to his specification by the Diesel Engine Co., to run on either petroleum residue or gas-oil tar, and will be in commission this autumn.

Fig. 1 shows some diagrams taken from the same engine running on different kinds of fuel. It will be seen from No. 1 that the combustion is very late and is also attended by violent explosions. This diagram was taken when running entirely off creosote oil. No. 2 diagram gives the ordinary Diesel diagram, and is a clear illustration how good combustion and smooth running can be obtained by the special arrangements made for mixing 5 per cent. of crude oil residue with the creosote oil. No. 3 is the ordinary diagram when using crude oil residue.

Fuel Costs.—In dealing with this subject it will be well, perhaps, to take first the actual guaranteed consumption of the 600 B.H.P. engine mentioned above, using petroleum residue having a caloritic value of 18,500 B.Th.U., at 37s. 6d. per ton.

Table I.

Engine Load.	Fuel consumption in lb. per kw.-hour.	Fuel cost in pence per kw.-hour.
12½% over	0·58	0·112
1/1	0·58	0·112
3/4	0·61	0·122
1/2	0·69	0·132
1/4	1·01	0·202

Table II. gives some details of Diesel plants that have been in operation some years.

Referring to Table I., it will be seen that the engine maintains its high efficiency until well below half-load. An examination of the fuel consumption curves of other types of engine will at once show the marked advantage of the Diesel engine in this respect; and there are also no stand-by losses whatever. This factor will be seen upon reference to Fig. 2, which represents the results of 12 months' working of a plant having an output of less than a quarter of a million units, with an average load factor of 14·28 per cent. These results are particularly noteworthy, as they show what can be done in small towns and villages by way of solving the electricity supply problem in such places.

The engine can be started with absolute certainty in a simple manner by means of compressed air, without the least danger, at any time within a minute of entering the engine room, even after a lengthy period of rest. Again, the fuel costs are in no way dependent upon any other factor than that of the price of fuel, and the guaranteed consumption per kilowatt-hour; there being no question of the price to be obtained for by-products to be considered.

In determining costs with Mond gas plants, the state of the market for such by-products must be seriously considered, and when one is likely to have large quantities of sulphate of ammonia or other fertilisers to be disposed of, it is as well to bear in mind the rapid and extraordinary progress that is being made in Norway in this line, particularly with reference to the electrical fixation of nitrogen.

The amount of cooling water used is extremely small. It is circulated round the cylinders at the rate of about 4 gallons per brake-horse-power hour, the outlet temperature not exceeding 120°F. The make up water should in no case exceed 2½ per cent. This is a most important consideration to those engineers who, like the author, have to take town water from the main. Compare this item with steam plant, especially cooling water for the condensers of turbine plants, or with producer plant, for gas engines.

The Diesel engine is entirely automatic in its action, preparing its own fuel, stoking itself, and rejecting the waste gases. No highly skilled labour is required, the services of a machine-minder or engine-driver being sufficient. One man per shift (exclusive of switchboard labour) can easily do all that is necessary in a Diesel power station, up to 1,000 kw. capacity.

The expenditure under repairs and maintenance is found to be very small, although those interested in other types of engine often state that the reverse is the case. Taking an actual case of three-power stations, having installed 1,500 B.H.P., a sum of £177 was expended between them during the last completed year, some of these engines having run practically continuously. This sum corresponds to 1s. 6d. per brake-horse-power per annum, which the author considers a very liberal allowance indeed, and it is certainly much too high an average for large sets.

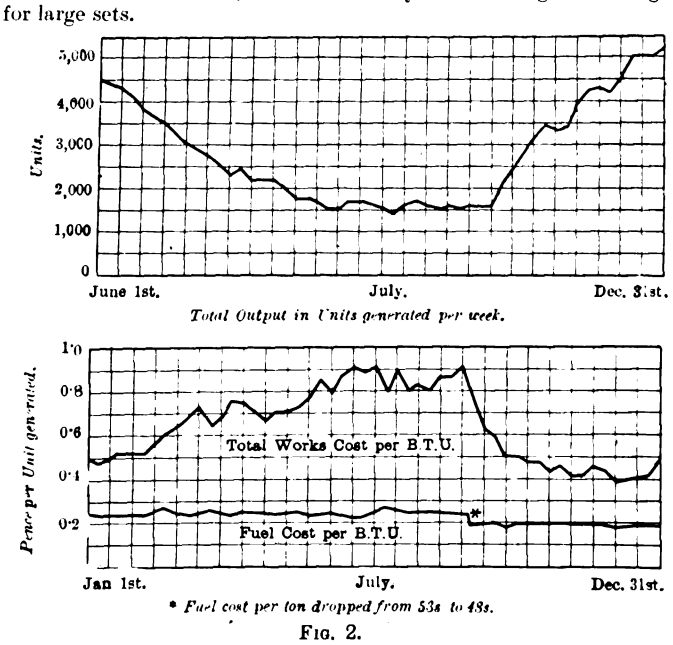

FIG. 2.

Records of several years' working of engines under various conditions show a consumption not exceeding 4 grammes of lubricating oil per Board of Trade unit generated, which at 1s. 8d. per gallon amounts to 0·019d. per unit. Also the cost of engine-room stores is reduced to a minimum, being considerably less than with either steam or gas plant.

High Power Diesel Stations.—There appears to be a feeling amongst engineers that, although the Diesel engine can compete with other forms of prime mover for small outputs, it is quite out of the question when large power stations are under consideration. That this is an entirely erroneous idea will be seen by the following comparison. The Brighton works is taken as an example of a large steam-driven station, and one of equal output for both Diesel and gas plant respectively is compared with it. The output in each case being 10,800,000 units generated, 9,000,000 units sold, with a load factor of 21·8 per cent. and a maximum load on generators of 5,900 kw.

The present capacity of the Brighton works is 10,200 kw., the approximate floor space per kilowatt installed 3·04 sq. ft., and the capital cost per kilowatt installed £19·52. The works cost per unit sold 0·70d., and per unit generated 0·583d., and total costs, including capital charges 1·124d. per unit sold, or 0·927d. per unit generated.

To obtain approximately the same capacity as the above, it would be necessary to instal seven Diesel sets, each of 1,450 kw. capacity, making a total of 10,150 kw. The total area occupied would be

Digitized by Google

17,699 sq. ft. (engine room 15,177 sq. ft.) The capital cost would be as follows :—

7 sets	£98,000
7 intermediate tanks, each 1,000 galls.	200
2 fuel pumps	100
2 air compressors	1,000
7 circulating water pumps	700
Switchgear (7 gen. 6 feeders)	9,000
Piping	500
Main reservoir (250,000 galls.)	3,500
Buildings	30,000
Foundations	3,000
	£146,000
Cost per kilowatt installed	£14·38
Floor space per kilowatt installed	1·6 sq. ft.

Details of work costs :—

Fuel (37s. per ton) 10,800,000 units at 0·66 lb. per unit	£5,920
Lubricating oil (2 grms. per unit) at 1s. 8d. per gal.	440
Engine room stores	200
Repairs and maintenance, at 1s. 6d. per B.H.P.	1,090
Wages :—	
3 shift engineers at £3 ; 3 voltmeter boys at 25s. ; 6 drivers at 35s. ; 6 greaser cleaners at 27s. ; 2 fitters at £2 ; fitters' mates at 27s.,	£1,927
Station superintendent	250
Total	£9,827

	Per unit sold.		Per unit generated.
Fuel	0·158d.	...	0·132d.
Oil, waste, water, &c.	0·017d.	...	0·014d.
Repairs and maintenance	0·029d.	...	0·024d.
Wages	0·058d.	...	0·048d.
Total works cost	0·262d.	...	0·218d.
Capital charges—	0·311d.	...	0·259d.
Total costs on same basis as steam driven plant	0·573d.	...	0·477d.

Gas Plant.

The same number and size of sets have been taken for this plant as for the Diesel plant, and the particulars, costs and other details for gas plant, have been taken from the Paper of Messrs. Andrews and Porter, read before the Institution of Electrical Engineers in Nov., 1908. This gives capital cost per kilowatt installed £17·68, floor space per kilowatt installed 5·2 sq. ft.

A fuel consumption of 14,000 tons has been taken as an approximate consumption for the output.

14,000 tons of coal at 12s. per ton	£8,400
Lubricating oil 0·37 galls. per 1,000 H.P.-hours at 1s. 6d. per gallon	400
Oil for auxiliary plant	100
Engine room stores at 0·002d. per unit	90
Repairs and maintenance at 0·046d. per unit	2,070
Wages :—	
3 shift engineers at £3 ; 3 voltmeter boys at 25s. ; 6 drivers at 35s. ; 6 greaser cleaners at 27s. ; 3 producer hands at 35s. ; 6 producer hands at 27s. ; 7 ammonia recovery hands at 27s. ; 2 men unloading coal, &c., at 27s.	£2,779
Station superintendent	250
Total works cost	£14,089
Works cost per unit generated :—	
Fuel	0·186d.
Oil, waste, water, &c.	0·013d.
Repairs and maintenance	0·046d.
Wages	0·067d.
Total	0·312d.
Capital charges	0·292d.
Total costs on same basis as steam plant	0·604d. per unit generated.

Summary.

	Steam.	Gas.	Diesel.
Floor space per kilowatt	3·043 sq. ft.	5·2 sq. ft.	1·6 sq. ft.
Area occupied :—			
Capital cost	£199,162	£176,875	£146,090
Capital cost per kw. installed	£19·52	£17·68	£14·38
Works cost per unit generated	0·583d.	0·312d.	0·218d.
Total cost per unit	0·927d.	0·604d.	0·477d.

Sub-Stations.

When one carefully considers the capital sunk in huge generating stations, expensive E.H.T. distributing systems and large sub-stations, also the repairs, maintenance and labour attached to these adjuncts, it is a matter of some surprise that the Diesel sub-station has not been more extensively adopted.

It must always be remembered that a central station, with sub-stations is entirely dependent upon one main station for continuity of supply, and although every possible precaution may have been taken, yet some very small failure may result in a total or partial shut-down, the effect of which is disastrous in any town of importance. Again, what is the overall efficiency of some of your large works with sub-stations ? At Brighton, where there is one large sub-station, the maximum load on the turbines was 5,900 kw., the maximum load on the sub-station being 4,727 kw., or an efficiency of about 80 per cent., which figure, the author believes, is somewhat above the average.

Where central stations, with their sub-stations, have already been established and mains laid, there may not be very much to be said for the Diesel plant, excepting on the score of (*a*) continuity of supply; (*b*) peak load plant, thereby increasing the load factor on the main works, and (*c*) staving off large extensions in the main works, until such time as such extensions can be used at a most profitable period.

Where there are additional sub-stations to be put down and E.H.T. mains laid, there is undoubtedly an advantage with the Diesel sub-station. Therefore, in the author's opinion, it naturally follows that for any new scheme involving the supply of energy over a large area, by means of a central station and sub-stations, there is no question but that the Diesel sub-stations would be the correct scheme to adopt.

It cannot be seriously suggested that a Diesel sub-station is undesirable or impracticable in a large city. There is in London a 100 B.H.P. set in the basement of one of the largest drapery establishments in Oxford-street, also a 1,100 B.H.P. sub-station in the City at Cannon-street and a still larger one at Charing Cross. There is also another large one in course of erection at Lambeth.

It is difficult to make comparison between sub-stations on account of varying conditions, but in a large city with 1,000 kw. sub-stations, the capital cost of a complete sub-station would be about £20 per kilowatt installed, including buildings, &c.

So far, only large size units have been considered and those with moderate load factors. The author next gives some comparative results of the three systems on a 100 per cent. load factor, which is admittedly entirely in favour of steam and gas plants. These results were compiled by the Maschinenfabrik Augsburg-Nuernberg Co. upon the conditions appertaining to South Wales, and, the author claims, show that even under these favourable conditions both the steam and gas plants cannot compete with the Diesel sets.

The plant considered comprised two sets, one of 600 B.H.P. and the other of 150 B.H.P., and the figures may be summarised as follows :—

	Diesel.	Steam.	Gas.
First cost	£6,815	£6,650	£9,250
Cost per B.H.P.-hour including capital charges and depreciation)	0·164d.*	0·173d.†	0·178d.‡

All the above prices include packing, freight to c.i.f. Cardiff and services of skilled erectors. The plants are all three of equally good workmanship and reliability.

The general conditions assumed are as follows :—Combined ouptut of the two engines per annum : 4,554,000 B.H.P.-hours at a power-factor of 90 to 100 per cent. And the special conditions :—

Diesel Plant.—Price of liquid fuel, 40s. per ton. This is the present average price in this country. Anthracen oil or creosote oil which are distilates from coal tar, can also be used and could be got from the Bargoed coke oven plant. The commercial value of these oils is also about 40s. per ton.

Water required by using re-cooled water about 0·221 gallons per brake-horse-power-hour. Transport and storage of fuel easy and simple. No ashes, no banking losses. Starting up of engines possible within two or three minutes at any time.

Steam Plant.—Price of suitable coal 9s. per ton, evaporating 8 lb. of water per lb. Water required by using re-cooled water, about 1·7 gallons per brake-horse-power-hour.

Banking losses, ashes must be carried out, inspection of boilers necessary, starting up requires longer time.

Gas Plant.—Suitable fuel would be two-thirds coke breeze from Bargoed, mixed with one-third of coke, at a total price of 8s. per ton. The coke breeze must be non-coking, and contain not more than 25 per cent. ashes, not more than 25 per cent. particles smaller than 2 mm., not more than 25 per cent. smaller than 2·4 mm.

Water required by using re-cooled water about 1·2 gallons per brake-horse-power-hour.

Small banking losses, ashes must be carried away, smaller repairs of producers compared with boilers. Starting up in two to three minutes possible when producer in fire.

Some further Continental results on smaller Diesel sets with varying load factors given in the Paper show the average works costs (excluding capital charges) to be approximately 0·36d. per unit.

* Oil at 40s. per ton. † Coal at 9s. ‡ Coke at average of 8s.

Digitized by Google

After Mr. R. M. Carr had read his Paper, of which an abstract is given on page 458, the following discussion took place on the two Papers :—

DISCUSSION.

Mr. CHAS. DAY (Mirrlees, Bickerton & Day) opened the discussion stating that he himself had had nine years' experience of Diesel engines, and that his firm had had 14 years' experience, one of their engines having been running at their works for that period. On the score of saving in fuel cost he said that engineers would be surprised at some of the figures available. Taking an average of a number of stations in which Diesel engines were used, the saving in fuel amounted to 40 per cent., the lowest in the list being 30 per cent. By comparison with gas engines the Diesel showed a saving of 60 per cent. These figures applied to fuel, but there was also an economy in wages, maintenance, upkeep, water, &c. In the early high-speed engines there was trouble with excessive consumption of lubricating oil, but these troubles had now been got over. He had found on test that the consumption of lubricating oil had dropped from 0·42 lb. per horse-power in the slow-speed type to 0·3 lb. per horse-power in the newer high-speed pattern. The difference was due to their having been using the lubricating oil in the cylinder of the engine. The oil used was about the same as that used in good steam plant. Although no guarantees were given with Diesel engines, they had been found by engineers installing them to be as satisfactory in operation as steam plants with which guarantees were regularly given. As far as the size of unit was concerned, with steam the larger the unit the better the economy, the lower the capital charges cost per kilowatt, and the lower the maintenance charges. With the internal combustion engine the position was reversed. The gross cost of working went up as the size increased. Above 150 H.P. per cylinder there were complications of higher temperatures, water-cooled pistons, &c. The size of unit with internal combustion engines had to be considered on a different basis from that of steam plant. The makers of Diesel engines were often accused of charging up unduly high prices and of obtaining large profits. His own firm, as their balance-sheet showed, paid no royalties and showed 2 per cent. profit. Regarding the vexed question of oil supply, Sir Marcus Samuel stated some time ago that the visible supply of oil was in excess of the visible demand. This statement had recently been repeated, and might be accepted. Well boring was being carried on extensively, and there was no likelihood of a scarcity for many years. Mr. Day concluded by endorsing Mr. Howard's statement that there would be startling developments with the Diesel engine in the next few years.

Mr. LEONARD ANDREWS (Key Engineering Co.) expressed surprise at Mr. Howard's figures, which showed that energy could be generated by Diesel plant at 30 per cent. less than with gas engines. The figures showing that cost of generating with steam plant was 50 per cent. greater than with gas would not be accepted by engineers as the best that could be done. Mr. Howard had based his gas-engine estimates on those of Porter and Andrews in their Institution Paper, and assumed an output of about half that given in that Paper—11 million units instead of 21 millions—from which he further assumed that the coal consumption decreased in the same proportion, allowing 14,000 tons of coal for this output. Any gas engine maker would, he felt sure, guarantee to generate the same output with 11,000 tons of coal. This would decrease Mr. Howard's estimate by 3,000 tons, or £1,800. Although Mr. Howard introduced the figures of ammonia recovery plant, given in the Paper mentioned, he omitted to credit the plant with the sale of the bye-products. At present prices that would mean £3,600 per annum. This meant in all about £5,400 was knocked off Mr. Howard's figures of £14,000, making £8,500 for the gas plant, and representing about £1,000 less than the Diesel cost, which he regarded as a very fair estimate. On the question of guaranteed consumption, Mr. Howard had pointed out that with the gas engine, from half load to 12½ per cent. overload, the fuel consumption curve was flat. He had plotted a curve of Mr. Howard's oil figures on the top of a gas engine makers' guarantee curve (oil at 40s. per ton and coal at 12s. per ton), and these curves coincided at half load. Above this the oil figures were 20 per cent. higher and at quarter load they were 10 per cent. lower than gas. This showed that above half load to full load the gas engine was better, and below half load the Diesel was to be preferred. He thought that the cost of oil would not follow the natural law of supply and demand. He had seen engineers in the colonies who were satisfied with the running of Diesel engines, but who complained of the uncertainty regarding the future price of oil, seeing that the rate was influenced by the manipulations of the oil trust. He referred to a 360 H.P. Diesel engine which he found running unattended in a cotton factory for at least a quarter of an hour. He thought there was a big future before the Diesel engine, which he did not look upon as a competitor of the gas engine. The installation of Diesels was an earnest of the future universal employment of internal combustion engines for electricity generation. Dealing with Mr. Carr's Paper and the rating of the engines, he thought that engineers should obtain definite information regarding the M.E.P. upon which the output was based. The rating of 70 lb. to 100 lb. per square inch was too high, as these pressures imposed great strains on the engine. Messrs. Galloways and Ehrhardt & Sehmer worked to a maximum of 70 lb., and the average working pressure was below this, so that there was a considerable overload capacity. He disagreed with Mr. Day that the cost of internal combustion engines increased with their size. The capital cost did not, and the efficiency increased, also the oil consumption was lowered, similarly with labour and repairs. Continental practice proved to the contrary in that where small engines of a few hundred horse-power were installed a few years ago the units now put down were of several thousand horse-power.

Mr. G. SEATON (Willans & Robinson) made an amusing speech, in which he recalled the early efforts of the gas engine makers with the small stations, and spoke of the manner in which they now fancied their chances for the larger stations in the big cities. Even Mr. Pearce had considered estimates for large gas engines. This he wished to describe in his own words as "holding out the carrot to the donkey." It was difficult to get figures as to working of gas engines until the beginning of this year, when a Paper by Mr. A. L. Chorlton (of Mather & Platt), before the Manchester Association of Engineers, provoked one of the finest discussions he had ever heard on the subject. He had asked Mr. Carr by telephone to attend the meeting, but was told that he was too busy, and he quite believed it. While he respected Mr. Andrews' opinion, he thought that a gas engine could be likened to a 6 ft. wife, it would keep a man at home. In the course of his 20 years' experience he felt that the bigger the gas engine the bigger the trouble.

Mr. H. Boot gave particulars of the Diesel plant which he had installed at Chichester some years ago, and in which he depended entirely on the plant without a battery. He thought that in a few years the Diesel engines which were now being installed in certain places would be found to be unsuitable. The makers were apt to give rather rosy figures which it was difficult to bear out in practice. He would like Mr. Howard to present the Association with the figures of two or three years' working, and he thought that the superiority of the Diesel over the steam engine would not be so apparent. Wages and skilled attendance were of importance, and, unless looked after, the plant after a few years might have to be scrapped. At Chichester he found that the fuel for the first year was 0·291d., wages 0·543d. and repairs 0·21d. per unit. Regarding oil supply there was a difficulty in transport and fewness of tank steamers, although the actual sources of oil would always exist. He instanced the use of oil fuel on Mexican locomotives, and in spite of the economy experienced, the fireboxes had to be changed back for coal, because of the difficulty in obtaining oil. He gave a number of maxims for those about to instal Diesel engines. The plant should be of moderate size, a price for spares should be obtained from the makers, also a 12 months' maintenance guarantee, the engine should be frequently indicated, there should be ample oil storage, and spare bottles for the compressed air, and lastly a tank for a reserve supply of cooling water.

Mr. G. WILKINSON (Harrogate) asked Mr. Carr for further particulars about the sale of by-products. Sulphate of ammonia would fetch £13 a ton, and as a rule there was a good yield from the sale of by-products. As to Diesel engines, he quoted a case of a 40 H.P. engine installed for sewage pumping in Harrogate which was running from 1902 1905. The cost of oil was £3. 10s. at the wharf, 10s. for carriage, and 7s. 6d. cartage, or £4. 7s. 6d. a ton at the works. The guarantee was 0·1d. per horse-power-hour, but it worked out at a round figure of £50, on the basis of seven days a week, 16 hours per day. This contrasted strongly with Mr. Howard's figure of 1s. 6d. per brake-horse-power, which would come out at £3 per annum. Although the engine was installed some nine years ago and the figures were accordingly exaggerated compared with present practice, they served to show that the guarantees of makers should not be considered too seriously. As to repairs, the engine in question had required one exhaust valve, 58 valve springs, 12 vulcabeston rings, one full cone, two pulverizers and nipples, six air pump rings, 30 air pump springs, and one cylinder liner. As to the future engine of the Diesel type, he thought that the single-acting pattern with cylinders back to back would come to stay. A 2,000 H.P. engine operating at 150 revs. per min. required a floor space of 887 sq. ft., with a double-acting engine, and 170 sq. ft. for a two-cycle engine.

Mr. MULHOLLAND (M.A.N. Co.) said the Diesel engine plant at the Halle Works included only one engine—built at the Augsburg works of the M.A.N., and only the foundations for two further engines had been built. At present the single-acting four-cycle engine was the standard engine, but in future, especially for engines of 1,000 B.H.P. and upwards (at least as far as firms experienced in building large internal combustion engines were concerned) this would not be the case, as otherwise the sad experience of the gas engine makers who tried to enlarge the small single-acting gas engines would be likely to be repeated. The double-acting four-cycle or the two-cycle engine would take its place. A single-acting two-cycle engine could be built safely and cheaply up to about 2,000 B.H.P., while a limit for single-acting four-cycle engine ought to be reached at 1,000 H.P. With regard to oil supply, in 1908 the world's production of crude oil was 38,000,000 tons; only one-500th of this was used in Diesel engines. Germany alone produced 300,000 tons of gas tar oil, which Mr. Howard said could also be used. He thought this proved that the artificial raising of the price of crude oil would be impossible. It had been his experience and that of the M.A.N., who built Diesel, steam, and gas engines and steam turbines, that the repairs of a substantially built Diesel engine were not larger than those of a first-class steam engine. He gave instances of M.A.N. Diesel engine installations in Germany of 2,760, 800, 1,250, 3,500, 1,700, 1,200 and 360 B.H.P.

Mr. KAULA (Willans & Robinson) said that his Company had a two-cycle 50 kw. Diesel engine in operation at the Royal Agricultural Show at Norwich, and though it was yet early to speak of the future of this engine in larger sizes, they were hopeful of developments. He reminded Mr. Andrews that the oil consumption of the Diesel engine was practically constant between half load, full load, and overload.

Mr. A. BLACKMAN (Sunderland) disagreed that the Diesel working pressures were low, in spite of the slow burning of the fuel. The substantial construction of the engines flatly contradicted this statement. There had been cases of the repeated breakage of crankshafts, which pointed to very heavy high stresses in the engine. He agreed with Mr. Day that the difficulties with the Diesel type engine increased with the size. He thought that Mr. Howard might have selected for comparison

Digitized by Google

a station different from Brighton, where the coal costs were higher, due to freight charge charges. At Sunderland, instead of 0·583d. per unit generated, the works cost was 0·2104d., with turbine and reciprocators. These were actual, and not hypothetical figures. Modern steam plant could be installed at £12. 5s. per kilowatt, and, allowing 8 per cent. for capital charges, the costs incident to capital expenditure were 0·185d. per unit, which if added to works cost last year a total of 0·395d. was obtained, showing a saving of £2,600 over Mr. Howard's Diesel figures. The turbine in question required 17 lb. to 18½ lb. of steam per kilowatt, but with a modern turbine at least £2,000 could be knocked off the working expenses. If Mr. Andrews could beat Diesel figures by £1,000 a year with gas, a modern steam turbine plant would beat the Diesel figures by at least £4,600 a year. Diesels had a very small overload capacity compared with steam, which was another enormous advantage in favour of the latter.

Mr. H. L. Dixon (Leatherhead) gave some results with two 120 kw. units in his station. Repairs did not amount to more than £2 a year for the five years, and there was little prospect of immediate extensive repairs. A new cylinder liner would, he thought, be needed about once every seven years. For his small station the fuel cost was 0·22d., compared with the more usual 0·75d. or 1d., with inefficient steam plant. On the year's work the fuel consumption was 0·7 lb. per kilowatt-hour, as against the guaranteed figure of 0·64 lb. The load factor was 14 per cent. for the station. On the price of oil, he gave 77s. a ton five years ago, and now had a contract for four years at 48s. 6d. In his case the charges for transport were high as compared with those given by Mr. Howard.

Mr. W. G. Pickvance (Wrexham) said the Diesel oil engine having been dealt with so effectively, he proposed to offer some criticism of Mr. Carr's Paper. He did not appear to have considered the high-power horizontal engine, but to have confined himself to the vertical high-speed engine. If his engine had been low-speed horizontal his Paper would have been more exuberant in favour of the gas plant. Users of gas engines had told him (Mr. Pickvance) "Don't," and in almost every instance he found the type of engine was the old single-cylinder type. The horizontal high-speed gas engine was preferable to the oil engine. There were disadvantages in the latter, particularly the vertical high speed, the moving parts of which wore quickly.

Mr. S. E. Fedden (Sheffield) supported Mr. Blackman's defence of the steam turbine. He thought that coal costs for steam stations were falling, and in his own case he knew they would drop to 0·15d., and this was with mixed turbine and reciprocating plant. He deprecated the idea of the meeting countenancing the truth of the comparison given in the figures. He pointed to the need for under loading the internal combustion engine, or working it intermittently. A motor-car engine which would take a car anywhere up and down the country would be useless if placed in a motor boat. The marine motor had to be twice the size for a constant load such as was imposed on it by a motor boat.

Mr. L. V. Robinson (Richardsons, Westgarth) said that his Company were now building a marine type Diesel engine of 1,000 H.P. operating on the two-cycle principle. When the tests of this were completed they might turn their attention to a similar type for land use. He thought the Diesel engine most useful for sizes up to 500 kw. and 1,000 kw. Manufacturers were, however, prepared to go to sizes of 6,000 H.P. in four cylinders, each developing 1,500 H.P. As to repairs, he knew of a gas engine plant in the north of England of 550 H.P. which in three years had not cost more than £30 per annum. In the Far East his firm had a 4,000 H.P. gas plant in four units, running 2½ years, and on test this took 0·94 lb. of South China bituminous fuel per brake-horse-power-hour. The efficiency had been maintained and no trouble was experienced.

Mr. J. E. Edgcome (Kingston-on-Thames) asked Mr. Carr if, after what had been said, he would carry out his extensions in gas, Diesel or steam plant.

The authors reserved their reply for the Association "Proceedings," owing to lack of time.

The following is an abstract of Mr. Carr's Paper which was discussed conjointly with that of Mr. Howard.

INTERNAL COMBUSTION ENGINES FOR POWER STATIONS.—GAS ENGINES AND PRODUCER PLANTS.*

BY R. M. CARR.

(Chief Electrical Engineer, Leek.)

Summary.—The author gives a number of figures as to the first cost of steam-driven and gas-engine stations. These show that below 1,000 kw. the gas-engine station costs less than the steam plant. After giving particulars of the Leek electricity supply station the author next compares the works costs of gas and steam stations under 1,000 kw. capacity; and, in conclusion, he draws up a statement of the capital and running costs of a gas-driven station of 1,000 kw. capacity.

The author here proposes to confine himself entirely to gas engines and producer plants, and to deal more particularly with stations of comparatively small capacity. The ever-increasing demand for cheap units makes it absolutely necessary that some steps should be taken to reduce the works costs, and with a steam plant it is almost impossible for a small undertaking successfully to cater for a heating and power load. This is felt most keenly in small manufacturing towns; and in such cases a carefully designed scheme of internal combustion engines is generally advisable.

* Abstract.

In the first place, the thermal efficiency of a gas plant is admittedly much better than that of steam, but the advertised figures of some makers of gas engines are seldom, if ever, realised under ordinary working conditions, and it is impossible to get anything like such results with the fluctuating load of the average central station. On the other hand, electrical engineers are somewhat prejudiced against the gas engine, and are consequently inclined to magnify the troubles which exist.

Capital Charges.—The price of a gas-driven generator against a steam unit of the same capacity is undoubtedly higher, and when the size of the unit contemplated warrants the consideration of a steam turbine, the gas engine is a long way out of the running. If the whole installation, however, is considered, it is found that, below a certain capacity, the gas-driven station costs less than steam, while, as the capacity increases, the figures are reversed in favour of steam.

The following figures are the averages of the actual costs per kilowatt of a number of stations of both steam and gas:—

Stations under 500 kw. capacity.

Steam.		*Gas.*	
A.—Engines, dynamos, boilers, switchboard, accumulators, &c.	£36·0	A.—Engines, dynamos, producers, switchboard, accumulators, &c....	£28
B.—Land, buildings, &c....	19·1	B.—Land, buildings, &c. ...	12
Total per kilowatt	£55·1	Total per kilowatt	£40

Between 500 and 1,000 kw. capacity.

Steam.		*Gas.*	
A.—	£26·1	A.—	£24·4
B.—	11·8	B.—	9·0
Total per kilowatt	£37·9	Total per kilowatt	£33·4

Between 1,000 and 2,000 kw. capacity.

Steam.		*Gas.*	
A.—	£20·0	A.—	£22·0
B.—	9·5	B.—	8·5
Total per kilowatt	£29·5	Total per kilowatt	£30·5

The majority of steam stations under 500 kw. are run non-condensing. In the case of stations of between 500 and 1,000 kw. and between 1,000 and 2,000 kw. the figures given for the steam stations are the averages of the whole of the stations whose figures are published, but those of the gas stations are estimates, based chiefly upon manufacturers' quotations. In the case of steam the figures are probably higher than would be the case if a station of the capacity stated were designed at the present time. In preparing the estimates for the gas plant a similar allowance has been made. The three curves A. B. and C. (Fig. 1) illustrate the comparison between the capital expenditure for gas and for steam. These show that for very small stations gas costs much less than steam, but for anything above 1,000 kw. the equipment of a steam station costs slightly less than gas. If the curves were continued to, say, 8,000 or 10,000 kw., the difference becomes rather more marked in favour of steam.

The author also tabulates the cost of the plant and buildings at Leek, which station is entirely gas driven and is of 420 kw. capacity.

Engines and dynamos	£6,567
Producers, cooling plant, &c.	2,070
Switchboard and electrical auxiliaries	1,392
Accumulators.....	719
Travelling crane	189
Total	£10,937
Per kilowatt installed £26	
Land, buildings and foundations	£5,413
Per kilowatt installed £13	
TOTAL COST PER KW. INSTALLED, £39.	

The gas plant is of the "Wilson" pressure type manufactured by the Horsehay Co. (Ltd.), and consists of two producers, each nominally of 300 B.H.P. capacity, but which are capable of 25 per cent. overload without forcing to the point of inefficiency.

Water bottoms are provided for continuous running. The gas passes from the producers through an omnibus main into four dust catchers, which are merely cylindrical boxes, where the greater part of the dust is deposited. The cooling operation is carried out by means of a series of double tubes, fitted concentrically, the gas passing between the outer and inner tubes, a large cooling surface thus being obtained. The cooled gas is then washed, the tar which is extracted flowing into a tar separator, and the gas passes through sawdust purifiers, leaving the last of the tar in the process. The purifiers are connected in parallel in order that one may be cleaned without shutting down.

Digitized by Google

A small holder is provided, merely as a mixer and governor, but is not intended as a reservoir. From the holder an 18 in. main is provided and separate services connected to the various engines.

The generating plant consists of two horizontal Otto cycle, single-cylinder gas engines, each of 100 B.H.P., one four-cylinder vertical engine of 200 B.H.P. and one Korting two-cycle engine of 275 B.H.P. Each engine is coupled direct to a d.c. generator. The station is further equipped with a 400 ampere-hour battery and the usual balancer, boosters and other accessories.

Running Costs.—It is usually acknowledged that the fuel costs of a gas-driven plant are considerably below those of a steam plant of similar capacity, but the other items, making up the total costs, have a considerable bearing upon the question when making the comparison. Particularly is this the case in repairs and maintenance of engines, which, in the author's opinion, will be somewhat greater after a few years of running for gas engines than for steam.

Comparison of Capital Costs.—Total Capital Expenditure.

Fig. 1.

On the other hand, the repairs to a well-designed producer plant should not be anything like so great as those of boilers. The author met with difficulty in getting reliable figures. For purposes of comparison, however, he has taken the figures of three municipal undertakings, each entirely gas driven, also the averages of several other undertakings gas-driven (the names of which he is not at liberty to publish), and compared these with the average of all the municipal undertakings of a capacity of under 1,000 kw. Where the figures given were per unit generated, 20 per cent. has been deducted from the number of units in order to allow for losses, so that the figures shall fairly represent the costs per units sold.

—	Averages of Municipal gas undertakings.	Averages of other gas stations.	Averages of steam stations.
Capacity in kilowatts.....	314	632	600
Units sold per annum	299,210	874,720	502,980
Costs per Unit Sold.			
Fuel	0·28d.	0·26d.	0·53d.
Oil, waste, water and stores	0·06d.	0·04d.	0·06d.

Rent, rates and taxes	0·10d.	not available	0·12d.
Management, &c...	0·41d.	not available	0·34d.
Total costs	1·30d.	...	1·63d.

Regarding the general running of producer plants, a great number of the failures one hears about are attributable to lack of knowledge and experience on the part of the attendants. For this manufacturers are somewhat to blame, as the rosy picture often presented of a suction plant which takes care of itself, requiring only a few buckets of coal per hour, is not often realised. The secret of success in producer gas plants is systematic cleaning, particularly in bituminous plants. Most of the stoppages are due to neglect of this important point.

Suction plants, burning anthracite and coke, up to, say, 200 or 300 H.P., are now an acknowledged success where ordinary care is taken, and some thousands of horse-power are in successful operation, but except in case of very small plants, they are not very desirable for central station work. One reason is that anthracite is expensive, except in districts in close proximity to the collieries where it is produced, and another reason is that a suction plant is not very suitable for the sudden variations in load often experienced in central station work. The author is of opinion that for a station of anything over 300 or 400 kw. capacity, a pressure plant with a small holder is preferable.

On a fully loaded suction plant 1 lb. of anthracite would be required per B.H.P.-hour, which at 30s. per ton would cost for, say, a 300 H.P. engine, 4s. per hour for fuel, while a pressure plant burning bituminous coal would require 1½ lb. per B.H.P.-hour, which at 10s. per ton for the same size of plant would work out at 2s. per hour. Another advantage which the pressure plant has over the suction type is that it is much more elastic in operation.

When installing suction producers a separate plant should be installed for each engine, but with a pressure plant the producers can be connected in parallel through an omnibus main in the same way that boilers and steam engines are connected, and the various engines can be started up or shut down as required without affecting the producer plant, and this is really the only way successfully to cope with the varying load of a central station. The holder ensures a comparatively even quality of gas, which is absolutely essential, as a varying quality means mis-firing, indifferent governing, and all the attendant evils at a time when steady running is most necessary.

The disposal of the effluent from the washer of a producer plant often presents a difficulty, especially in inland towns. When the water is turned into a sewer care should be taken that it is not hot. The author has recently met with opposition from the County Council to the effluent finding its way into a stream, but is getting over the difficulty by, instead of allowing the water to run away in a continuous stream, circulating it by means of a pump and tanks, and treating it with lime. This treatment has the effect of throwing down the sulphur compounds in the form of mud, and only a very small quantity of the treated liquor will be allowed to flow into the drain from time to time. This, it is expected, will quite get over the difficulty and also effect a saving in water.

In dealing with the tar the author has not met with much difficulty. The mixture of tar and water, after leaving the washer, passes into a separator, the heavy tar settling in the deep end of the tank, from which it is pumped from time to time and sold, and the water overflowing out at the end and circulated as before described. The tar is sold in barrels, the net price obtained being from 6s. to 11s. per ton, the price varying with the percentage of water found in the tar. The sawdust scrubbers are cleaned every week and the tarry sawdust, which usually extends to a depth of of 3 in. or 4 in., changed for clean. The tarry sawdust is burned under the vertical boiler, and with the addition of about 1 ton per week of coke breeze dust, is sufficient to raise all the steam required for the blower engine and the producers. The only trouble the author has experienced from tar in the engines was in one engine the design of which caused the

Digitized by Google

gas to pass through the valves at a very high velocity; this velocity had the effect of dropping what tar remained in the gas, and after a few weeks these valves became clogged. This was got over by fixing a cast-iron box containing a series of grids of fine brass gauze near the gas inlet, and these grids are changed and cleaned every week. The engine is now entirely free from tar, and other engines are not in any way affected.

In choosing the site for a gas-driven station care should be taken to avoid a residential neighbourhood, as the noise from the exhaust and the occasional firing of a charge of gas in the exhaust pipe is very annoying. An excellent way of silencing the exhaust is by means of exhaust boilers, where the plant is large enough to warrant this. These boilers are not expensive, and besides acting as silencers, they are able to raise sufficient steam for all purposes required on the producer plant. The author deprecates the silencing of the exhaust by means of water in the exhaust pipes. The sulphuric acid formed by the mixing of the water with the sulphur in the gas causes rapid deterioration of the exhaust pipes, necessitating their complete renewal after a few years.

Where an exhaust boiler is not considered advisable, a very good method of silencing the exhaust is shown in the diagram (Fig. 2). This method was adopted at Leek with most satisfactory results. The exhaust enters the first pit direct from the engine, where it is allowed to expand and is broken up by means of a series of stoneware pipes set in concrete between the two pits, and passes from the second pit through two uptakes with practically no noise. With this method no back pressure is put upon the engine.

With most of the modern types of engine a sufficiently good cyclic regularity can be obtained either for direct current or alter-

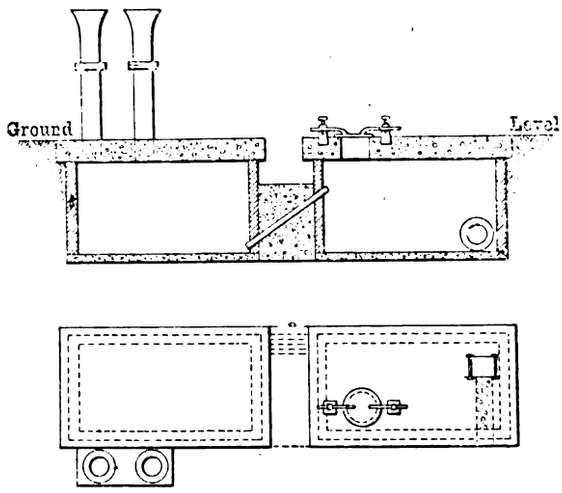

Fig. 2.—Gas Engine Exhaust Pits, Leek Electricity Works.

nating work, but for the latter close governing must be insisted upon. This is a point the importance of which has not yet been fully realised by some manufacturers. Another matter in which manufacturers are open to criticism is the rating of their engines, the temptation being slightly to overrate them. To engineers accustomed to the elasticity of steam engines regarding overload, this often leads to disappointment and dissatisfaction, especially after the engine has been running for some time, and, owing to wear, the compression has dropped slightly. A gas engine cannot be overloaded, and it is as well, when deciding the size of engine to put down, to specify a plant rather larger than what is really required.

To attempt to overload a gas engine causes overheating and pre-ignitions and the heavy strain put upon the engine in consequence causes rapid deterioration and costly repairs, to say nothing of the erratic running and consequential upsetting of the load while these pre-ignitions continue.

It must not be understood that the author is of opinion that gas engines as a whole are unsatisfactory for generating stations. There are engines which have been running for years, giving great satisfaction, and there is no reason why, with proper care and intelligent control on the part of those in charge, municipalities should not reap the benefit of the low running costs of a partially or totally gas-driven station.

In conclusion, the author draws up a statement of the capital and running costs of a gas-driven station of 1,000 kw. capacity. The proposed producer plant consists of three producers each of 500 B.H.P. capacity, and capable of 20 per cent. overload for two hours.

The producers are provided with a coal charging platform, which should be level with the railway siding. Connected from each producer is a complete cleaning and cooling plant consisting of dust-catchers, condensers, washers and purifiers, the latter coupled up in parallel for cleaning purposes. A gas holder 15 ft. diameter by 10 ft. deep is provided as a mixer and governor, and the whole plant arranged for continuous running.

The generating plant consists of three engines of 450 B.H.P. each and one of 150 B.H.P., coupled direct to three d.c. dynamos, each of 300 kw. capacity, and one of 100 kw. A boiler is provided in the exhaust of each engine, which will generate the steam required for the blower engine and for use in the producers, tar separating and other purposes. A cooling tower, for cooling the engine circulating water, and the necessary pumps are also provided. The station is further equipped with switchboard, 1,000 ampere-hour battery, boosters, balancers, and the usual offices, workshops, &c.

The complete cost of this plant, based upon manufacturers' quotations, comes to £21,120. or £21·1 per kilowatt; or, including £9,500 for land, buildings, &c., £30·6 per kilowatt.

Assuming a load factor of 20 per cent. and the annual sales to be 1,000,000 units, the maximum load would be 570 kw. This could easily be carried by the plant allowed for with sufficient spare plant held in reserve. Taking the fuel consumption at 2·25 lb. per unit generated, and adding 10 per cent. for stand-by losses, and assuming the station efficiency, *i.e.*, units sold to units generated, to be 80 per cent., then 1,326 tons of coal would be consumed per annum, which, at 11s. per ton, would cost £729.

The water required for the gas plant would be about 2,000 gallons per day, or 730,000 per annum. For engine cooling purposes 4 gallons per B.H.P.-hour is necessary, and allowing for an average running of two engines for 8 hours and one engine for 16 hours per day, 57,000 gallons per day would be circulated. 5 per cent. of this may be assumed to be evaporated or otherwise lost. This amounts to 1,051,000 gallons per annum, or 1,781,000 gallons altogether.

The cost of oil, waste and engine room stores should not exceed £200 per annum.

The wages item is based upon the following staff: three shift engineers, three drivers, three cleaners, one fitter, three producer attendants and two coal trimmers, and totals £22. 15s. weekly.

Breakdowns, however, could be covered by insurance; and for £120 per annum this risk could be met. In addition to this, £400 should be allowed for small renewals and ordinary wear and tear, which should be sufficient for all purposes, the repairs to a producer plant being very small indeed. The estimated works cost per unit sold is then as follows:—

Fuel	0·174d.
Water, Oil, waste and stores	0·058d.
Wages	0·283d.
Repairs and maintenance	0·124d.
	0·640d.

By the courtesy of the authorities the members were enabled to pay visits during the afternoon to H.M. Dockyard and the power houses of the Corporation's lighting and tramway departments, and subsequently a cruise on the Solent was taken in ideal weather.

Brighton, Thursday, June 29.

The meeting this morning took place in the Banqueting Room of the Royal Pavilion, Brighton. The programme comprised two discussions, viz.: "The Puuchase of Fuel," opened by Mr. C. E. C. Shawfield (Chief Electrical Engineer, Wolverhampton), and "Street and Shop Front Lighting," opened by Mr. A. H. Seabrook (St. Marylebone).

Purchase of Fuel.

Mr. C. E. C. Shawfield (Wolverhampton) in opening the discussion on "The Purchase of Fuel," said the importance of the matter to any electrical undertaking was one which hardly needed emphasis; particularly with the rapid rise in power loads of the last few years. In making a contract the position of the power station relative to the coal fields was one of the principal factors to be considered. The cost of carriage to Brighton was heavy and in the case of Birmingham it was comparatively small. The cost of carriage per heat unit was important. A cheap coal of 10,000 B.Th.U. calorific value might be best in some cases, whereas in the case of a station a long way from the coalfields it did not pay to buy coal with less than perhaps 13,500 to 14,000 B.Th.U. calorific value. Another important matter was the boiler house and the method of firing adopted. With hand firing the boiler doors were opened frequently for cleaning with an inferior class of fuel, and remained open so long that considerable strain was thrown upon the boiler. A good deal of heat was also brought out with the clinker, but with mechanically-fired boilers, which were to a large extent self-cleaning, a poorer class of fuel could be used and the heat units lost in cleaning were much less. The question of the percentage of incombustible contents had an important bearing

Digitized by Google

on the commercial value of fuel. The incombustible contents included clinker, ash and moisture. The deleterious effect of the solid incombustible material seemed to be much greater than that of the moisture. The fireclay and shale had to be raised to the furnace temperature, and with internally-fired boilers it was removed at nearly furnace temperature, but although heat was expended in evaporating the moisture, the heat of the steam so produced largely passed back to the boiler, so that this heat was not entirely wasted. He had made experiments with fuel before and after washing. The fuel was fine, dirty, pit-bank sludge of a calorific value of 9,500 B.Th.U. per lb. of unwashed fuel, costing 4s. 5d. per ton delivered. The moisture contents were 5 per cent. and ash about 28 per cent. But that calorific value could not be taken as a true criterion of the commercial value as when tested by a calorimeter of the usual type. The ash contents were raised to the temperature of combustion and they subsequently gave up their heat to the water in the testing apparatus, but when it was burned in the boiler furnace practically the whole of the heat used to bring the ash and clinker to furnace temperature was lost because the ash and clinker was ejected in an incandescent condition. The calorimeter test gave 397,000 B.Th.U. per ld. Allowing for heat lost by rejection of ash and clinker this was brought down to a commercial value of about 290,000 B.Th.U. per ld. After washing, this coal gave an average of 11,700 B.Th.U. per lb., or an increase of 2,200 B.Th.U. This washed fuel cost 5s. 6d. per ton delivered. The moisture was 13 per cent. and the ash was reduced to about 11 per cent. That gave the same value per ld. as the unwashed fuel did by the calorimeter test (397,000 B.Th.U.). Deducting the heat used for raising the temperature of the uncombustible material this gave a net commercial value of 350,000 B.Th.U. per ld. So the effect of washing was to increase the calorific value from 290,000 to 350,000 B.Th.U. per ld. A colliery in South Staffordshire used a simple and effective washing apparatus consisting of a wooden trough about 12 in. wide and 12 in. deep and from 50 yds. to 100 yds. in length with a gradient of about 1 in 30. The unwashed fuel was fed in at the top with a stream of water. Shale and slate were deposited in the first 30 yds. of trough, and a comparatively clean fuel, improving in quality as the lower end was reached, was obtained. The fireclay remained suspended in the water and was carried away. This fuel frequently came to the works with 25 per cent. of moisture, but that could be removed by 24 to 48 hours storage in a perforated bunker.

Our report of the proceedings at Brighton yesterday (Thursday) is concluded on p. 472.

CONFERENCE ON EDUCATION AND TRAINING OF ENGINEERS, 1911.

This conference opened at the Institution of Civil Engineers on Wednesday last, a number of questions cognate to the wide subject of education being discussed.

Mr. ALEX. SIEMENS, president of the Institution of Civil Engineers, presided at the opening meeting and made the following prefatory remarks :—

It is my pleasant duty to welcome in the name of the Institution of Civil Engineers not only members of the Institution but also a number of distinguished visitors interested in the subject of the education and training of engineers, which is to be discussed at the meetings of this Conference. Thanks to the great Imperial gathering attracted to London by the Coronation, we are fortunate enough to see among us representatives from all parts of the Empire, who are familiar with the great variability of engineering problems under different conditions of climate and of development of the material resources of a country. Their experience will be of the greatest utility during our deliberations.

In calling this Conference together the Council have endeavoured to define the scope of discussion by declaring its object to be : "To consider the methods of preparation to be adopted by those who contemplate entering the engineering profession in compliance with conditions laid down by the by-laws for election into the Institution." The arrangement of our meetings is, therefore, based on the requirements of the by-laws, which demand that a candidate should possess : (1) A sound general education, developed upon lines suited to subsequent scientific study ; (2) a competent knowledge of those branches of science which form the basis of engineering ; (3) practical training under actual engineering conditions. In addition, there is the necessity, common to all professions, which Prof. Max Müller, in his first lecture on the Science of Language, defines as follows : ". . . no science and no art have long prospered and flourished among us, unless they were in some way subservient to the practical interests of Society . . . that interest depends on the practical advantages which Society at large derives from these scientific studies."

Applying this principle to the problem submitted to this Conference, it may be expressed by saying that a young engineer should be educated so as to become a dividend-earner for his employer, for this is the most reliable indication of his merit, and the corresponding reward will not be wanting. For the same reason he should possess some knowledge of business methods and of law, not with a view of becoming his own lawyer, but in order to be able to judge when legal advice is needed. Besides all these requirements he will find one or more modern languages very useful for obtaining remunerative employment, as the value of his services is thereby increased in the estimation of his employer.

The omission of the "business" aspect of education should not be taken as a sign of its unimportance, but owing to the very short time at our disposal the Council considered it desirable to indicate the lines to be followed by asking a number of prominent men to open the discussion on definite subjects in the three sections of the Conference, all of which have a direct bearing on the question of so instructing young men as to fit them to take part in the design as well as in the control and direction of engineering works.

It is hardly necessary for me to insist on the value of proper training for engineers after what I tried to demonstrate in my address last year, that modern civilisation owes its characteristic features to the success of the engineer in improving communications and in superseding manual labour by mechanical power. There is every indication that people more and more realise to what degree the conditions of living comfortably, according to modern ideas, depend upon the work of our profession, and the interest taken in this Conference is a sign of the serious view that is taken of the importance of its object. We may accept as a conclusive proof of this the fact that the Right Hon. Lord Pentland, Secretary for Scotland, and the Right Hon. Walter Runciman, M.P., President of the Board of Education, have kindly consented to act as Vice-Presidents of the Conference.

Whilst it is not proposed that definite resolutions should be arrived at by the Conference, but that it should be simply a means of forming and maturing the views of those interested in the subjects brought forward for discussion, the Council have felt that it would be desirable to give the widest and most immediate publicity to the proceedings of the meetings, and have accordingly invited the attendance of representatives of the Press to the gatherings. In this respect, the course taken differs from that adopted for the professional discussions of the Institution, which, of course, in their complete form, include criticism by correspondence on the part of members all over the world. These aim at securing a deliberately considered and permanently reliable statement of matters connected with engineering practice ; which, it is felt, can only be arrived at in a satisfactory manner by the procedure adopted for the Institution's own publications, of having all reports and criticisms fully revised by contributors before they are published. In the present case, however, the exchange of views which it is the purpose of the Conference to promote is not subject in any such [illegible] agree to the foregoing considerations, and as the object is rather to form opinion than to arrive at and to record definite conclusions, the Council are pleased to know that the Institution will be assisted and supported very materially in this Conference by the Press.

The President read a letter of apology from Prof. D. S. Capper, one of the honorary secretaries of the Conference, who was unable to be present owing to a recent accident.

Letters of apology were also read from Lord Pentland and Mr. Runciman, two of the vice-presidents, who were unable to be present owing to a Cabinet meeting.

Sir WM. WHITE thought this Conference might be considered as the third step which had been taken by the Institution in regard to the training of engineers. The first step, that of laying down an examination, had been followed by a tendency towards theory in training. That tendency was counteracted by a committee over which he had presided and which had laid down that the average student was the person to be considered. Geniuses would always find their proper level. He thought that the excessive devotion to the scientific side was a danger at the present time. This Conference would, however, endeavour to find the golden mean between too great theory and too great practice in the education of engineers. He thought the president and council in summoning this Conference had done well, not only in the interest of the Institution, but for the profession at large.

Sir JOHN WOLFE-BARRY said at the time examinations were established by the Institution scientific training was being neglected ; and that step had considerably raised the status of the engineer. He thought that the general education of an accomplished gentleman should not be lost sight of in the training of the engineer. A civil engineer ought to be a cultured gentleman with a theoretical and practical knowledge of his profession.

Mr. SIEMENS then declared the conference open.

Sections I. (General Education) and II. (Scientific Training) held a joint meeting in the library of the Institution, under the chairmanship of Mr. A. G. LYSTER. The first business was a short address by the chairman, of which we give an abstract below :—

Those who have at heart its best interests—and I am sure I can include amongst them all the members of this Institution—will agree that the general education of young men desiring to become

Digitized by Google

engineers, with which subject Section I of the Conference deals, requires the closest attention of those who, on the one hand, realise what the necessities of the profession demand, and those on the other hand who control the selection and organisation of education; and so it seems very fitting that, in contradistinction to the too prevalent practice of "muddling through," the heads of our universities and public schools should meet the members of the profession and discuss with them the best preliminary training for those who are hereafter to uphold its traditions. The Institution itself has done much in recent years towards ensuring that all its members shall have a suitable intellectual equipment, which will not only qualify them for their membership here, but will be of advantage to them in the practice of their profession, and the by-laws of the Institution have been modified with the object of securing this end; but these efforts to obtain the best results require to be supplemented and supported by the action of university and school authorities.

It will probably always be a disputed question at what period specialisation shall be entered upon, and to what extent it shall be carried in the preliminary education of the would-be engineer; but I am sure we all agree that some specialisation is essential at some period or other, and that the young man who has made up his mind to enter the profession shall have his education sooner or later directed towards those special subjects which are likely to be of most use to him in his work. At the same time I feel certain that everybody will equally consider it a most undesirable thing that an engineer should be a mere one-sided creature, with no other intellectual equipment than a knowledge of the special subjects to which he would hereafter have to devote his attention, and that any system of education which produced such a result could not be satisfactory.

Education to be of real value should, I take it, not only furnish information and knowledge, but should also train and expand the intelligence and develop that type of character which fits a man to lead the best and most useful life, and all subjects and methods which can produce this result should be included in the curriculum of university and school life. It must be remembered, however, that a great many of these institutions were founded and organised in days when the conditions of life were very different from what they are to-day, and certainly much less strenuous, and when competition, both individual and international, was much less keen. The choice of professions, too, in those days, was much more limited, and so the curriculum established was one which lent itself much more to the development of scholarly culture than to the practical requirements of those who to-day have to fight the keen battle of life.

With an ever-increasing intensity of struggle, and with the developments of science ever enlarging its boundaries and multiplying its complexities, the demand for special training for the engineer becomes increasingly urgent, and unless he is to be debarred from our universities or public schools, it behoves the authorities to bring their educational standards into line with modern requirements.

As I have said before, we are very far from wanting the members of our profession to be engineers and nothing else; on the contrary, we want every opportunity given to the best type of man that the university and public school can produce to start with the best intellectual equipment as an engineer. Much has been done in the immediate past to bring this about, but there still appears to be much left to do, and this Conference has been inaugurated with the view of exchanging and focussing ideas on the subject between the authorities on either side.

A year or two ago I read a speech by the head master of one of our public schools, in which he was at pains to defend the restricted form of education in vogue at his school, and his defence might be summed up in this—that insamuch as there was no lack of applications for admission to the school, there could not be much wrong with the education given there. Well, gentlemen, if our Conference produced no other result than to condemn that spirit, we should at least not have met in vain. But we require, and I think not unreasonably, something more; we want, added to all the peculiar advantages that the university and public school can give, an education which more especially fits the young man for the career in life for which he is destined, and which, in the case of engineering, comprises a profession of rapidly increasing importance, and one more closely than ever before associated with our national progress and prosperity.

Dr. J. Gow then read a Paper, an abstract of which we give below:—

LITERARY EDUCATION AND ENGINEERING.

BY REV. JAMES GOW, LITT.D.
(Head Master of Westminster School.)

I propose to argue that a literary education, up to a certain point, which I will define, is of as much value to the engineer as to anybody else; and that, at least in the higher walks of his profession, he is likely to be injured by the want of it. I do not contend that literary studies are of any direct or immediate use to the engineer. His work must be largely deductive and mathematical, on which a literary education has no bearing. But presumably there are occasions when he is called upon to make use of chemistry or geology, or some other inductive science, and he is not properly equipped unless he has a fair knowledge of these sciences. Now it is notorious, at least to schoolmasters, that a boy who passes from the classical side to the modern side of a school has an immense advantage in inductive science over those who have been educated entirely on modern lines. Latin, as we teach it, with grammar and dictionary, is inductive science almost in the abstract.

Secondly, the engineer is doubtless often called upon to command a gang of foreign workers. The sooner and the better he learns their language the more easily he will control them and direct their labour. The language, of course, may be wholly alien to any that is spoken, or ever was spoken, in Europe; yet the necessary elements of language must always be the same. There are things to be named and relations between them to be indicated, and the man who, by training, is alive to this fact and on the watch for these elements, has a great advantage over another who learns at haphazard.

Thirdly, though it is perhaps not the business of the engineer to make contracts, it is undoubtedly his business to understand them and to give and receive orders accordingly. These transactions require a careful and exact appreciation of words by whomsoever used.

Hitherto, I have spoken only of linguistic education, but something also should be said of literary studies proper—the world of books, poetry, history, and the rest. The engineer, in Europe, and I suppose also in India, China and other countries which have an ancient civilisation, is frequently called upon to deal with places and things which have artistic merits or historical associations that endear them greatly to the general educated public. The French proverb which says, "Rien n'est sacré pour un sapeur," implies that, in France at any rate, the engineer has not always been tender to such sentiments, and even in England—perhaps even in London—there may be found monuments of engineering skill which many people would wish away. But of late years the general educated public has become much more numerous and more highly educated, and I suspect that a time is at hand when it will be advantageous to the engineer to mingle the *utile* with the *dulce*, to discern not only what is mathematically possible but also what is artistically impossible; not only what is cheap, but also what is nasty. For this purpose some general culture is necessary, some critical faculty, some pleasure in beauty, some habit of reading and delight in reading such as makes a man liberal in mind and sympathetic to the common run of his fellows.

And this same culture which keeps a man from being a prig may also serve to keep him from becoming a beast. I suppose that an engineer has as much pleasure as other folk, and it is just as important to him as to them what use he makes of his leisure. Most of the mischief that is done in life is done in leisure, and the rational employment of this time is the real object of general education. To be happy with a book, to know a good book from a bad one, to be able to read a first-rate book over and over again finding new pleasure in it every time—the man who can do this is master of himself and saved from a hundred base temptations. To these temptations, I imagine, the engineer is peculiarly liable, since he is so often lonely in a far country and a cruel climate. Many of you must know instances of young men who have gone to the bad in such conditions, and who might have been saved if they had had more resources in their minds and had known what to do with themselves when they were off duty.

But you may say to me that, even if I had proved my case, I have proved too much, and a man who is to have all the education that I want to give him will never have time to become an engineer at all. But, in reality, there is no fear that literary culture will absorb too much time. Against that danger there is a very efficient safeguard. The boy who is going to be a first-rate engineer will not take any more literary education after the age of 16 or thereabouts. Until that age clever boys are almost always equally clever at every subject, but at 16 their tastes begin to be pronounced and their minds cease to be receptive except in one particular direction. Parents are seldom awake to this fact. They see a clever little boy amusing himself with a toy engine, or making an aeroplane, or interested in motor cars, and they assume that his ultimate bent will lie that way, and trundle him off to the modern side or the engineering school. It is a mistake to be in such a hurry. The best plan, I am sure, is to give a boy a general education, mainly literary, up to 16, and at that point to watch him closely, and put him to what he wants to learn. If he is clever, he will be successful; if he is not clever, he will at least be happy and proud of his calling.

(To be continued.)

EXPERIMENTS IN IMPACT EXCITATION.*

BY G. W. NASMYTH.

(*Concluded from page 376.*)

Summary.—In the concluding section of this article the author shows that minima in the Lepel oscillations occur at larger values of the direct current through the arc as the capacity in the shunt circuit is increased or the inductance diminished, and that the intensity of the oscillations increases. It is also shown that the frequency of the oscillations increases with the arc current and decreases with the arc length, and that the formula derived by the author for the frequency of the singing arc holds true also for the frequency of the oscillations produced by the new short arcs between metal electrodes.

The Intensity of the Lepel Arc Oscillations as a Function of the Arc Current, Capacity and Inductance.

It has just been shown that the Lepel generator resembles the arc more closely than the spark-gap, and has, in common with the Duddell and Poulsen arcs, a falling volt-ampere characteristic. Certain curious maxima in the direct-current voltage across the arc were observed as the arc length was varied at constant current, and the cause of these was finally traced to the influence of the capacity of the arc itself, these maxima in the voltage being accompanied by corresponding minima in the intensity of the oscillations.

Intensity of the Oscillations.—Two striking phenomena meet the observer. First, the alternating current, as measured by an unshunted hot-wire ammeter in the condenser circuit, is two or three times greater than the direct current measured by an ammeter in the main circuit. Second, if the direct current in the main circuit is varied, the intensity of the oscillations passes through a well-defined minimum. The value of the direct current at which this minimum in the oscillations occurs depends on the constants of the circuit, increasing when the capacity is increased and decreasing when the inductance is increased. The first characteristic indicates that these oscillations belong to the third class of "Wien" or "impact" oscillations; the second characteristic has interesting consequences in the theory of the relation of the intensity of the oscillations to the other factors of the circuit.

Inasmuch as the frequency of the oscillations varies with the current in the main circuit, the difficulties of calibration at varying frequencies made it impossible to use any kind of an ammeter with a shunt. Accordingly a special ammeter was constructed without the use of iron, in which the entire current passed through a small copper wire, 0·22 mm. in diameter and about 9·5 cm. long. This ammeter was connected in the oscillation circuit, as shown by the dotted lines in Fig. 1, and calibrated before and after each set of observations by comparison with the direct-current ammeter in the main circuit.

The results of the experiments on the variation in the intensity of the oscillations with the arc current are given in Fig. 7. Each curve corresponds to a definite capacity in the oscillation circuit, one Leyden jar representing a capacity of 0·00188 mfd. The same inductance, 14,400 cm., was used for the nine curves, so that the frequency range was from 324,000 with nine jars capacity to nearly a million with one jar. In each of the curves the oscillations pass through a minimum, well-defined in the curves for the larger capacities, less so at small capacities. These minima move over into the region of larger arc currents as the capacity is increased, following apparently a straight line law. This furnishes additional evidence that the capacity of the arc itself must be considered as connected in parallel with the capacity of the condenser circuit as far as the effect upon the intensity of the oscillations is concerned.

In the Paper the arc currents at which the minima in the oscillations occur are also plotted as ordinates with the corresponding capacities as abscissæ. The resulting curves are seen to be straight lines. As the inductance in the oscillation circuit is increased the slope of these lines is seen to decrease, at first rapidly, then more slowly. The arc current for minimum oscillations is apparently some inverse function of the inductance, and directly proportional to the capacity. At small inductances traces of a second minimum were observed at smaller currents, and at large inductances these secondary minima became more prominent than the others. These secondary minima follow the same straight-line law as the primary minima.

The straight lines of this figure all give an x intercept corresponding to the capacity of the arc itself, considered as a condenser. The mean value of the intercepts was found to be 0·54 Leyden jar, equivalent to 0·01 mfd.

The capacity of the arc is added to the capacity of the condenser circuit as far as the intensity of the oscillations is concerned. But for the frequency of the oscillations the author's experiments (described later) show that the arc acts merely as a resistance, and that its capacity effect does not enter directly. An important corollary of these two observations is that the Lepel arc may be available as a source of very high frequency oscillations whose intensity shall not be too greatly decreased. In other words, with an arc whose capacity is large, it may be possible to produce electric waves shorter than 1 metre, having a mean intensity much greater than that of the short waves produced by a Hertz oscillator.

Theoretical Considerations.—We can obtain some insight into the reason for the minima observed in the intensity of the oscillations, and shown in Fig. 7, with the aid of a formula first derived by M. La Rosa* for the maximum value of the oscillatory current. If we write down the energy relations for the condenser circuit for the instant of sparking and for the instant when the condenser current is a maximum, we have

$$\frac{Li^2_{max}}{2} = \frac{LI^2}{2} + \frac{Ce^2}{2},$$

where i is the condenser and I the generator current and e the sparking potential of the gap. Solved for the maximum condenser current, the equation becomes

$$i_{max.} = \sqrt{(I^2 + Ce^2/L)}.$$

The four assumptions under which the formula holds have been summarised by Vollmer as follows: (1) At the instant of sparking the condenser current $i = I$, the generator current. (2) The damping

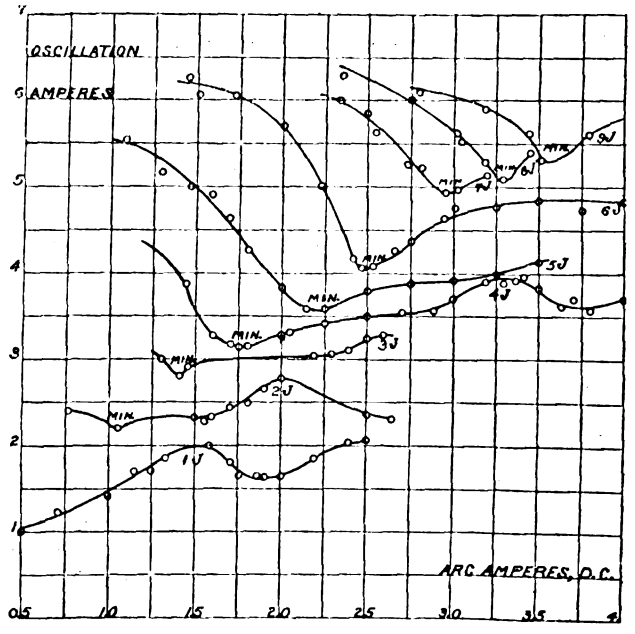

Fig. 7.—Variation in Intensity of Oscillations with Arc Current at Constant Capacities.

loss due to the resistance of the condenser circuit is negligible. (3) The energy produced in the condenser circuit on account of the falling characteristic of the arc during the discharge time T_2 is negligible. (In the Duddell oscillations this is the main source of energy.) (4) The energy $Ce_b^2/2$, stored in the condenser at the instant that the condenser current is a maximum is negligible. (e_b is the P.D. across the arc during the maximum discharge.)

In order that the formula shall hold for the short spark generators it is necessary to assume also: (5) The energy stored in the capacity of the spark-gap itself is negligible.

Theory shows that the assumption (1) is permissible, since for a sufficiently large choke coil in the main circuit the changes in the generator current are very small. The errors introduced by assumptions (2) and (3) tend to neutralise each other. Assumption (4) is unnecessary, as Vollmer has shown, if we use, instead of e^2, the difference of the squares of the sparking potential e and the P.D. across the arc during discharge, e_b. The author's experiments have shown that the capacity of the arc cannot be neglected in the short spark generators, but as a first approximation we may treat the equation as it stands.

If we assume the simplest relation, that the sparking potential is inversely proportional to the generator current, we have $e^2 = k/I^2$, the proportionality factor k being a function of the arc length. For small variations in the arc length it is probable that k may be con-

* Abstract of three articles in the "Physical Review."

Digitized by Google

sidered a constant. Using this value of e, the approximate formula becomes

$$i_{max.} = \sqrt{(I^2 + Ck/LI^2)}.$$

At large values of the generator current I the first term under the radical will be of importance and the second term small. For small values of the generator current the second term will be important and the first term small. Under the limiting conditions of very large or very small currents I, therefore, the condenser current maximum $i_{max.}$ will be large, but at intermediate values the condenser current will have a minimum in its initial maximum value and in its corresponding effective value. This is in agreement with the experiments of the author.

We can find the value of the current for which the oscillations will be a minimum by equating the differential $di_{max.}/dI$ to zero. The condition for a minimum is $I^4 = kC/L$, so that the critical current for minimum oscillations should be a function of the capacity and inductance at constant arc length. This also is in agreement so far with the author's experimental results. The experiments show, however, that the critical current is directly proportional to C instead of to the fourth root. The difference may be due in part to the influence of capacity on the relations of the maximum and effective values of the condenser current, and in part to the influence of the frequency, which is a function of the capacity on the sparking potential. The indirect effect of an increase in the capacity in lowering the sparking potential (through the influence of the duration and intensity of the oscillatory current) would also modify the relation between the capacity and arc current for minimum oscillations.

The capacity of the arc is in parallel with the capacity of the condensers and the divided circuit may give rise to the two minima, observed in the oscillations. The effective capacity of the condenser branch of the divided circuit is reduced by the inductance in series, however, and with a large inductance in the condenser circuit the capacity of the arc becomes more important. This is probably the reason why the second minima become more important than the first at the large inductance of 327,500 cm.

Impact Excitation.—The bearing of the minima in the value of the effective and initial maximum condenser current upon the problem of impact excitation is apparent. It is evident that the oscillations will be most quickly damped out when their initial value is least. The average intensity of the oscillations will be least also in this case. To secure the most favourable conditions for impact excitation, therefore, the arc current or arc length should be adjusted to give a minimum in the intensity of the oscillations. If the arc current is varied by means of a rheostat in the main circuit at constant arc length, capacity and inductance, the desired minimum can easily be found with the aid of a hot-wire ammeter.

The Frequency of the Lepel Oscillations.

Duddell and Poulsen Oscillations.—From theoretical considerations the author has derived* a formula for the frequency of the singing arc agreeing closely with all the experimental data which have been published on the Duddell and Poulsen arcs. In its general form this formula is

$$n = \frac{1}{2\pi}\sqrt{\frac{1}{LC} - \frac{(R + dV/dA)^2}{4L^2}},$$

where n is the frequency, L is the inductance, C the capacity and R the resistance of the oscillatory circuit, and dV/dA is the slope of the volts-amperes characteristic curve. If we take the value for the slope as given by the author's experiments at high frequencies, viz., $-(c + ld)/A$, where l is the arc length, A the arc current and c and d are constants depending upon the electrodes and the atmosphere in which the arc is formed; and if, further, we neglect c and R, which are usually small in comparison with the term ld, we get the approximate formula

$$n = \frac{1}{2\pi}\sqrt{\frac{1}{LC} - \frac{l^2d^2}{4L^2A^2}}.$$

The law of the variation of the frequency of the singing arc is fairly well known, and may serve as a guide in the investigation of the frequency of the short-arc metal-electrode generators.

Lepel Oscillations.—A loosely coupled secondary with variable air condensers and a hot-wire ammeter was used to determine the frequency, the connections being the same as in Fig. 1. It was soon found that the frequencies at which resonance could be obtained varied with the arc current. As some of the resonance frequencies were close together, considerable difficulty was experienced in trying to follow the variations of a single one as the current was changed, and it was finally decided to make a complete exploration of the field.

* Nasmyth, "The Frequency of the Singing Arc," "Phys. Rev.," 27, No. 2, p. 117, August, 1908.

The results of the more exhaustive experiments are given in Fig. 8, and show that the frequency of the oscillations produced by the Lepel arc increases with the arc current, as in the singing arc. The curves seem to occur in groups of three, and the middle curves in each group, marked respectively 1, 2 and 3, represent the largest amounts of energy for a given current, the companion curves above and below representing comparatively weak oscillations. Curve 1 is apparently the fundamental, and at large currents of 3 amperes or more this is the only resonance frequency that appears. It approaches asymptotically the frequency given by the Thomson formula $n = 1/2\pi\sqrt{L_1C_1}$ as the arc current is increased. The curve 2 is evidently the first harmonic; at 2 amperes, for example, when curve 1 indicates a frequency of 300,000 for the fundamental, the frequency for curve 2 is very closely twice as great, 600,000. The range is not quite large enough to make sure that curve 3 is the next harmonic, but this is probably the case.

The reason for the flatness of the curve 2*a* at 0·15 mm. in the region from about 1·5 to 2·5 amperes is clear from Fig. 5. This showed that the region of maximum voltage at 0·15 mm. is between 1·5 and 2·5 amperes, and Fig. 6 shows that the region of minimum oscillations corresponds with the region of maximum voltage. The currents plotted in Fig. 8 were measured by a direct-current ammeter in the main circuit, whereas the actual current which determines the resistance and characteristics of the arc includes not only this current, but the oscillatory current as well. The effective current

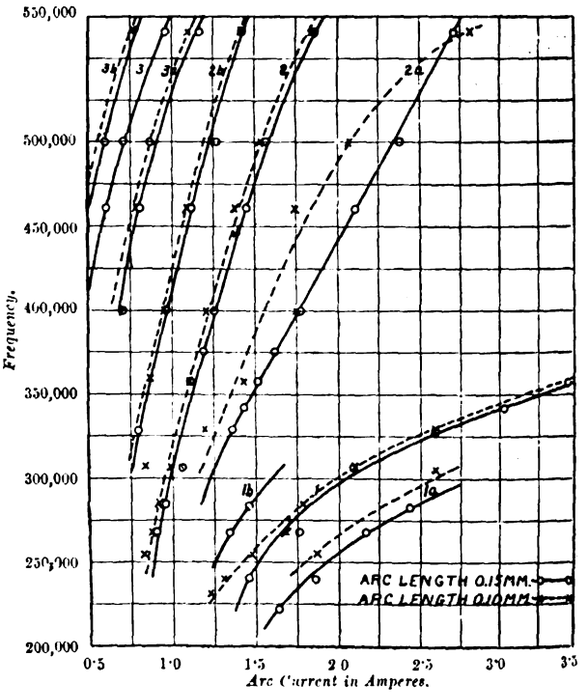

Fig. 8.—Change of Frequency with Arc Current.

traversing the arc is accordingly less relatively in the region where the full line curve 2*a* is flat, and if total currents through the arc were plotted instead of the direct current the flat part of the curve would bend over into its proper place in the region of smaller currents. The apparent shift of the curve 1*a*, and of most of the points in curve 1, in the same region, is explained in the same way.

Variation with Arc Length.—The full line and dotted line curves for arc lengths of 0·15 mm. and 0·10 mm., given in Fig. 8, show that the frequency decreases with increasing arc length, as in the case of the singing arc and in agreement with the formula above. On attempting to follow the changes in the curve I as the arc length was increased apparent inconsistencies were again met with, and the attempt to trace the course of the whole curve 1 was finally abandoned. The variation of the frequency of the fundamental with arc length at a constant current of 2 amperes was investigated. The results are given in Fig. 9. In both the curves of Fig. 9 the frequency decreases with increasing arc length except for regions of strongly marked minima in each case. On referring to Fig. 5 again it is found that these minima correspond to regions of voltage maxima and oscillatory current minima, so that the reason for the apparent discrepancies is traced as before to a decrease in the effective current through the arc. Thus, the minima in the oscillations and in the frequency for the 2 amperes direct-current curve both come at 0·15 mm. For the harmonic a smaller capacity and a smaller current were used than for the curves in Fig. 5, an

Digitized by Google

the minimum should be shifted into the region of longer arc lengths or smaller capacities, as it is. If this allowance is made, we may say that the minima in the oscillations and the frequency both come at about 0·3 mm. A second minimum, less pronounced, seems to be indicated at about 0·6 mm. in the curve for the frequency, and it is possible that the corresponding voltage maximum lies just outside the range of Fig. 5.

Proof of the Formula.—It is apparent from the above curves that the frequency of the Lepel arc agrees qualitatively with the formula which has been found to hold true for the singing arc. With the exception of the irregularities due to the oscillation minima the curves are of the same form as the corresponding singing arc curves. A more rigorous test of the formula is obtained by plotting the square of the frequency against the square of the arc length. Both these curves prove to be straight lines outside the regions of the above-mentioned irregularities due to a decrease in the intensity of the oscillatory current through the arc. If the effective current through the arc had been maintained constant instead of the direct current, the agreement of the curves with the straight line requirement of the formula would have been as satisfactory as in the case of the Poulsen arc.

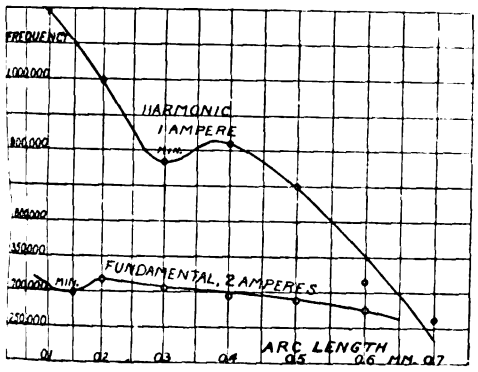

FIG. 9.—VARIATION OF FREQUENCY WITH ARC LENGTH.

Recent extensive experiments on the Poulsen arc* have shown that if the value of $d=k/\sqrt{C}$, where d is the arc constant and C the primary capacity, k has the same value for a given arc for all the values of inductance, capacity and Thomson frequencies used in practice. In its more general form the formula given above then becomes

$$n=\frac{1}{2\pi}\sqrt{\frac{1}{LC}-\frac{l^2k^2}{4L^2A^2C}}$$

The effect of capacity on the oscillation intensity and the form of the voltage current characteristics makes it very probable that the more generalised formula holds for the Lepel arc also, but sufficient data for a rigorous test are not yet available.

With a closely coupled secondary circuit and the arc current arranged to give minimum oscillations, a very sharp resonance curve with only a single wave is obtained by means of a loosely coupled primary circuit, as required by the theory of impact excitation. The maximum shifts with change of arc current, however, leading to the conclusion that the sharp resonance curve of the Lepel arc is due, not to free oscillations, but to *forced undamped* oscillations.

PHYSICAL SOCIETY.

At the meeting held on June 9, at the Imperial College of Science, Prof. H. L. CALLENDAR, F.R.S., in the chair,

A Paper on

"The Lüders' Lines on Mild Steel"

was read by Mr. W. MASON.

The conclusion is drawn that the Lüders' surfaces have the same or approximately the same inclination to an axis of simple pull or simple push. With stresses of opposite sign at right angles to each other the lines and surfaces are more inclined to the stress of greater intensity, and with equal intensities the surfaces are at about 45 deg. The author suggests that if a shear stress of given intensity be the only condition for that spreading of plastic strain which commences at the yield point, then there is no reason why there should be any variation in the angle of the Lüders' lines and surfaces. The variation suggests that not only the maximum shear stress—*i.e.*, the half difference of the greatest and least principal stresses—but also the magnitudes of the principal stresses are factors in producing the yielding condition in mild steel.

A Paper on

"A New Method of Harmonic Analysis by Averaging Selected Ordinates,"

was read by Prof. S. P. THOMPSON.

Assume with Fourier that the curve representing any periodic single-valued function of x may be expressed by the harmonic series:

$$y=A_1\sin x+A_2\sin 2x+A_3\sin 3x+\ldots.$$
$$+B_1\cos x+B_2\cos 2x+B_3\cos 3x.$$

Then to find the coefficient of any term, A_n or B_n, it suffices—subject to a limitation stated below—to measure off on the curve $2n$ equidistant ordinates over one period, that is spaced at successive intervals apart of π/n. Then, having reversed the sign of every alternate ordinate, the simple algebraic mean of them gives the coefficient sought. For cosine-coefficients the first ordinate must be taken at the origin; while for sine-coefficients the first ordinate must be taken at a point $\frac{1}{2}\pi/n$ from the origin. In symbols this is:—

$$A_n=\frac{1}{2n}\left\{y_{\frac{1}{2}\pi/n}-y_{\frac{3}{2}\pi/n}+y_{\frac{5}{2}\pi/n}-y_{\frac{7}{2}\pi/n}+\ldots.-y_{\frac{4n-1}{2}\pi/n}\right\};$$

$$B_n=\frac{1}{2n}\left\{y_0-y_{\pi/n}+y_{2\pi/n}-y_{3\pi/n}+\ldots.-y_{(2n-1)\pi/n}\right\}.$$

The limitation is that if in finding the nth harmonic, there be present also the $3n$th, or the $5n$th, or the $7n$th, &c., these will be included in the average found by the process, and must, if present, be separately determined and eliminated.

The process is much facilitated by the use of templates of transparent celluloid having equispaced vertical lines engraved upon them. They are laid down on the curve, and the values of the selected ordinates are thus readily measured off. For analysis of valve-motions, of alternating-current curves, of tidal observations, and diurnal magnetic variations, the method presents certain advantages, as it requires no multiplication of ordinates by sines or cosines.

The PRESIDENT commented upon the extreme ease with which the method adapted itself to the analysis of experimental curves.

Dr. RUSSELL remarked that the method could be usefully employed in interpolation as well as in harmonic analysis. In this connection he gave a brief *résumé* of Gauss's extension of Lagrange's interpolation formula. He also pointed out certain cases in which Fourier's analysis failed to be of practical use.

A demonstration of

"The Subjective Nature of the Difference Tone."

was given by Prof. S. P. THOMPSON.

Two tuning forks of frequencies 3.328 and 3.584 were sounded loudly. On striking the second the difference tone was heard, but while the notes from the two forks seemed to come in a definite direction from an external source the difference tone seemed to be located in the ear itself.

A demonstration of

"Spinning Tops and Gyroscopic Apparatus."

was given by Sir GEORGE GREENHILL.

A 52 in. Otto bicycle wheel was shown mounted on an axle with ball bearings, and spun by hand with the point in a small cup, to serve as a spinning top visible to a large audience.

The gyroscopic apparatus was made of an ordinary 28 in. bicycle wheel, the axle screwed into a stalk of a short length of rifle barrel, suspended from a lag on a bicycle hub; the hub is fastened to an iron bracket, which is bolted to the under side of a beam or sleeper, large enough to absorb vibration, and resting on two step ladders.

The wheel is spun by hand, and the axle is projected to obtain any desired gyroscopic motion, undulating, looped or with cusps.

The wheel can be detached by unscrewing the pin through the lug, and can then be used like the large wheel as a spinning top, or as the "Top on the top of a Top" described in Maxwell's "Life."

Put the wheel out of balance by a bar through the spoke and hold the axle, and it will serve as a pendulum, making oscillations however large, or complete revolutions; and the effect may be investigated of varying the angle of the axle with the vertical.

"A MODEL ILLUSTRATING THE PASSAGE OF A LIGHT WAVE THROUGH QUARTZ," constructed by Prof. H. N. ALLEN, of Poona, was described by Dr. H. S. ALLEN; and a Paper on "THE MEASUREMENT OF CONTACT DIFFERENCES OF POTENTIAL," by Prof. A. ANDERSON and Mr. J. E. BOWEN, and one entitled "A SHORT TABLE OF CIRCULAR AND HYPERBOLIC FUNCTIONS FOR COMPLEX VALUES OF THE ARGUMENT," by Mr. A. JOHNSTONE, were taken as read.

The Rates for Subscription to "THE ELECTRICIAN" are as under:—

	Year.	Half-Year.	Quarter.	
United Kingdom	26s. 0d.	13s. 6d.	7s. 0d.	Post free,
Canada	28s. 3d.	14s. 6d.	7s. 6d.	payable
Postal Union ...	30s. 0d.	16s. 0d.	8s. 0d.	in advance.

New volumes of "THE ELECTRICIAN" commence in April and October.

(This charge includes all the numerous Supplements.)

Vols. I to LXVI. can now be supplied. Price on application.

"THE ELECTRICIAN" SERIES OF STANDARD ELECTRICAL BOOKS

can be obtained of all Booksellers at Home, in the Colonies, and Abroad.

"THE ELECTRICIAN" ELECTRICAL TRADES' DIRECTORY AND HANDBOOK. Published annually in February, corrected to mid-February. Established 1882. A very valuable advertising medium, covering the entire Industry. SUBSCRIPTION Price (which is received *in advance* up to Jan. 31st in each year for the next following edition) 8s 6d. nett, postage 9d. extra. Published price 15s. nett, postage 9d. extra. Postage to British Colonies, 2s; Europe, 2s; U.S.A., 3s. 6d.; other countries, 2s. 6d. *Digest of Contents of the 1911 Edition sent free on application.*

THE PRACTICAL WIRELESS SLIDE RULE. By Dr. H. R. Belcher-Hickman. Price 2s. 6d. nett.

LIVINGSTONE'S DIAGRAM FOR THE EASY CALCULATION OF SHAFT AND BEAM DEFLECTIONS. By R. Livingstone. 2s. 6d. nett. By post in tube, 2s. 10d.

"THE ELECTRICIAN" PRIMERS (81 Primers in all, and a GLOSSARY). Single Primers 3d. each post free. *New and Enlarged Edition in One Complete Vol. or Three Separate Vols.* FULL PROSPECTUS FREE

ELECTRIC TRACTION ON RAILWAYS. By Philip Dawson. Price 25s. nett. *Prospectus free.*

ALTERNATING-CURRENT MOTORS. By Dr. Rudolf Goldschmidt. Price 6s. 6d.

THE SHOT-FIRER'S GUIDE: A Practical Manual on Blasting and the Prevention of Blasting Accidents in Mines, Quarries, &c. By W. Maurice. Price 3s. 6d. nett.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. Wilkinson, M.I.E.E. *New Edition.* Now ready. Price 15s. nett.

ELECTRIC BLASTING APPARATUS AND EXPLOSIVES: With Special Reference to Colliery Practice. By W. Maurice. Price 8s. 6d. nett.

THE ELECTRIC FURNACE IN IRON AND STEEL PRODUCTION. By John B. C. Kershaw, F.I.C. Price 3s. 6d. nett.

BRAKES FOR TRAMWAY CARS. By H. M. Sayers. Price 3s. 6d. nett.

THE MECHANICAL DESIGN AND CONSTRUCTION OF COMMUTATORS. By R. Livingstone. Price 6s. nett

THE ALTERNATE-CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Prof. J. A. Fleming, M.A., D.Sc., F.R.S. [abroad 13s.

VOL. I.—Price 12s. 6d. post free, abroad 13s. VOL. II.—Price 12s. 6d. post free,

HANDBOOK OF THE ELECTRICAL LABORATORY AND TESTING ROOM. Very fully illustrated. By Dr. J. A. Fleming. Vol. I., 12s. 6d. nett, Vol. II., 14s. nett.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. Fleming. 6s. nett.

ELECTRICAL LABORATORY NOTES AND FORMS. Arranged by Dr. J. A. Fleming, M.A., F.R.S. Single copies 4d. nett, or in dozens at 3s. 6d. nett. Complete Sets of 50 Notes and Forms, 12s. 6d. nett, or in strong portfolio, 14s. nett; or bound in strong cloth, 15s. nett. Spare Copies of Tabular Sheets, 1s. per dozen. Portfolios, 1s. 6d. each. Sectional paper, 1s. per dozen sheets. *Complete Prospectus post free on request.*

ELECTRICITY METERS: THEIR CONSTRUCTION AND MANAGEMENT. By C. H. W. Gerhardi. Profusely illustrated. Price 9s. nett.

ELECTRICITY IN HORTICULTURE. By Prof. S. Lemstrom. Illustrated. 3s. 6d nett.

RADIO-ACTIVITY: AN ELEMENTARY TREATISE FROM THE STANDPOINT OF THE DISINTEGRATION THEORY. By Fredk. Soddy, M.A. Fully illustrated. Price 6s. 6d. nett.

ELECTROMAGNETIC THEORY. By Oliver Heaviside. Vol. I. Price 12s 6d. Vol. II. Price 12s. 6d. *Vol. III. in the press.*

MOTIVE POWER AND GEARING FOR ELECTRICAL MACHINERY. By E. Tremlett Carter, C.E., M.I.E.E. Revised by G. Thomas-Davies, A.M.I.E.E., F.C.S. Price 12s. 6d. nett.

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. Ewing, B.Sc., F.R.S., F.R.S.E. Price 10s. 6d.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. Kennelly and H. D. Wilkinson, M.I.E.E. Price 6s. 6d.

ELECTRIC MOTIVE POWER. By Albion T. Snell. Price 10s. 6d. nett.

A POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. Gelpel and H. M. Kilgour. Price 7s. 6d. nett.

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. Elton Young. Price 10s. 6d.

STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By H. K. C. Fisher and J. C. H. Darby. Price 7s. 6d. nett.

SIGNALLING ACROSS SPACE WITHOUT WIRES: THE WORK OF HERTZ AND HIS SUCCESSORS. With new Chapter on Tuning. By Dr. Sir Oliver J. Lodge. Price 5s. nett.

THE ART OF ELECTROLYTIC SEPARATION OF METALS. By Dr. G. Gore, LL.D., F.R.S.

ELECTRO-CHEMISTRY. By Dr. George Gore. Price 2s. [Price 10s. 6d.

BEGINNER'S MANUAL OF SUBMARINE CABLE TESTING AND WORKING. By G. M. Baines. Price 7s. 6d. nett.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By Francis Jehl. Price 10s. 6d.

"THE ELECTRICIAN" WIREMAN'S POCKET BOOK. Price 5s. nett.

"THE ELECTRICIAN" HANDY WIRE TABLES FOR THE POCKET. By P. B. Down, Wh.Ex., A.M.I.Mech.E. Price 2s. 6d. nett.

THE RATING OF ELECTRIC LIGHTING, ELECTRIC TRAMWAY, AND SIMILAR UNDERTAKINGS. By W. G. Bond, M.I.E.E. Price 2s. 6d. nett.

DRUM ARMATURE WINDING AND COMMUTATORS. By F. M. Weymouth. 7s. 6d.

PRIMARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By W. R. Cooper. Price 10s. 6d. nett.

SECONDARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By E. J. Wade.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. Price 1s. 6d. [Price 10s. 6d. nett.

THE LOCALISATION OF FAULTS IN ELECTRIC LIGHT CABLES. By F. C. Raphael. 7s. 6d.

THE STEAM-ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. Beaumont, M.I.C.E., M.I.M.E., &c. Price 6s. nett.

THE ELECTRIC ARC. By Mrs. Ayrton. M.I.E.E. Price 12s. 6d.

TRAMWAY TRACTIVE EFFORT AND POWER DIAGRAM. By Arnold G. Hansard, B.A., A.M.I.E.E. Price 4s. 6d. nett; in Tube, 5s.

THE BRITISH POST OFFICE TELEPHONE SERVICE. Fully Illustrated. Price 3s. 6d. nett.

INTERNATIONAL TELEGRAPH CONVENTION AND SERVICE REGULATIONS. Price 6s. nett. (LISBON REVISION, 1908.)

BOILER FEED WATER. By F. W. Anderson. Price 6s. nett.

(PRELIMINARY) WIRELESS TELEGRAPH CONFERENCE (BERLIN, 1903), PROCEEDINGS AT. Price 8s. 6d. nett.

INTERNATIONAL WIRELESS TELEGRAPH CONVENTION AND SERVICE REGULATIONS (BERLIN, 1906). With complete report of Proceedings. Price 21s. nett.

THE TWO-TONE VIBRATING TRANSMITTER AND CABLE INDUCTIVE SIGNALLING. By Edward Raymond-Barker. Price 1s. nett and post free. [Price 3s. nett.

THE CLASSIFICATION OF ALTERNATE-CURRENT MOTORS. By V. A. A. Fynn, M.I.E.E.

ELECTRIC CRANES: THEIR DESIGN, CONSTRUCTION AND APPLICATION. By H. H. Broughton. Being Vol. I. of a Complete Manual of Lifting and Hauling Machinery. *Ready shortly*, price 25s. nett.

MANUAL OF THE TELEPHONE. By W. Aitken, M.I.E.E. *Nearly ready.*

ELECTRIC MAINS AND DISTRIBUTING SYSTEMS. By J. R. Dick, B.Sc., and F. Fernie, A.M.Inst.C.E. *Nearly ready.*

ELECTRICAL MANUAL FOR MINING ENGINEERS. By H. J. S. Heather, M.I.E.E. *Ready shortly.*

THE MECHANICAL DESIGN AND CONSTRUCTION OF GENERATORS. By R. Livingstone. *In Preparation.*

LIGHT, RADIATION AND ILLUMINATION. From the German of Paul Hörner, by Justus Eck. *In Preparation.*

WIREMAN'S POCKET BOOK AND ELECTRICAL CONTRACTOR'S HANDBOOK. Compiled by A. W. Robinson and W. E. Warrilow. *In Preparation.*

"THE ELECTRICIAN" INDUSTRIAL SUPPLEMENT.

With "THE ELECTRICIAN" for Sept. 14, 1906, was issued the first of a series of "Industrial Supplements," to be published from time to time with "THE ELECTRICIAN." The fifty-third issue of the Supplement published (Gratis) with the number of "THE ELECTRICIAN" for September 23, 1910, was the last of the monthly issues. "THE COMMERCIAL AND INDUSTRIAL SUPPLEMENT" to "THE ELECTRICIAN" is now issued weekly (Gratis). It will be found towards the end of the present issue.

NOW READY.

Vol. LXVI. of "THE ELECTRICIAN." Bound in Publisher's covers. Price 17s. 6d. Postage U.K. 1s. extra, abroad 2s. 6d.

Cases for binding Vol. LXVI. are now ready, price 2s.; post free, 2s. 3d.

INTERNAL COMBUSTION ENGINES.

There is a persistent feeling among engineers that the internal combustion engine, owing to its high efficiency as compared with the steam engine, must eventually take a more recognised position in power stations than it does at present. It is not surprising, therefore, that two Papers on this subject should be included in this year's programme of the Incorporated Municipal Electrical Association at Brighton. The Paper by Mr. R. M. CARR deals generally with the use of gas engines and producer plant. At the outset the author admits that the excellent results advertised by some makers of gas engines are seldom realised with the fluctuating loads found in electricity supply. Nevertheless there are certain distinct advantages in favour of gas plant more particularly in small stations. For example, there is the question of capital cost. In this Paper curves are given showing that for very small stations the first cost of gas plant is much less than that of steam, but when the capacity is above 1,000 kw. steam plant begins to be the cheaper of the two. On the other hand, repairs and maintenance are somewhat heavy, though possibly not so heavy as for steam engines and boilers combined. One of the weakest points in comparisons, as usually made, is no doubt the rating of gas engines. The natural tendency, due to competition, is to rate them too high. The gas engine is necessarily at a disadvantage when handling overloads as compared with the steam engine, and more particularly the steam turbine. Yet, taking all things into consideration, and notwithstanding early failures, it will be generally admitted that the small station offers a distinct field for the internal combustion

Digitized by Google

engine. By "small station" we mean such a one as is likely to remain small for many years to come, and in country districts such cases are numerous.

The Paper by Mr. H. L. HOWARD is rather more restricted in its view, and deals purely with the Diesel engine. There is no doubt that a strong case can be made out for this ingenious engine in many ways. It possesses, of course, all the advantages of being self-contained, as does every oil engine, and thus it compares favourably not only with steam plant, but also with the gas engine, more particularly when this is supplied with pressure gas from gas producers. Moreover, it has the added advantage of having no ignition apparatus. Stand-by losses are nil, and therefore if the load is maintained above the half load of the engine, where the efficiency is good, the fuel cost throughout the year per unit generated is practically constant. Again, the labour required for running is a minimum, and it is stated that one man per shift, exclusive of switchboard attendance, is sufficient to run a Diesel station up to 1,000 kw. capacity. With regard to repairs, the position is not quite so evident, but results, as far as they go, tend to show that the repair bill is not heavy. Mr. HOWARD mentions a sum of 1s. 6d. per brake-horse-power-year as being a liberal allowance, and published figures seem to support this view. It is, however, necessary to bear in mind that the figures obtainable are for stations which have been in operation for a comparatively few years. As plant becomes older, the cost of repairs inevitably rises.

Mr. HOWARD takes the view that Diesel engines might well be used for large stations, and as an illustration he gives an estimate of the first cost and running cost of the Brighton station of 10,000 kw. capacity as it would be if equipped with Diesel engines. The first cost is shown to be lower and the running cost is much reduced by this substitution. Although we do not deny possibilities in this direction we doubt if very much faith can be put in estimates. Even the performances of stations which appear to be working under similar conditions vary considerably in the various items comprised in "works costs," and therefore such estimates are generally only rough guides. There is also a difficulty in comparing a station on new lines with an existing station. Every existing station supplying electric light and power has been equipped by degrees as the load developed. Consequently, a station like that at Brighton is not laid down initially for 10,000 kw. The plant installed originally, as regards size of units, was more suitable at that date than now, and doubtless the present plant will be still less suitable ten years hence. Thus a fair comparison cannot be drawn by taking the existing station, though it may be said that had the station been started with Diesel engines, assuming the estimates to be correct, it would now be showing considerably lower costs.

Mr. HOWARD also supports the use of Diesel engines for sub-stations, and we gather that he is in favour of eliminating the usual converter plant. In that case we do not quite see the point of the name "sub-station," for we then have a number of small stations running in parallel with the main station. We dealt with this question quite recently when referring to the employment of Diesel engines in the sub-stations of the Charing Cross Company, and we have not anything to add on the present occasion. This question must resolve itself eventually into the high efficiency of the large station plus transmission and conversion losses as compared with the lower efficiency of the small station with no transmission and conversion losses; and it appears to us that the large station must eventually win the day against a number of small stations below a certain size.

REVIEWS.

(Copies of the undermentioned works can be had from THE ELECTRICIAN Office, post free, on receipt of published price, adding 3d. for books published under 2s. Add 10 per cent. for abroad or for foreign books.)

Les Enroulements Industriels des Machines à Courant Continu et à Courants Alternative. By EUGENE MARIC. (Paris: Gauthier Villars.) Pp. ix. + 240. 9fr.

The book before us is addressed to those engineers and students who wish to understand thoroughly the constitution of modern armature windings. It is not a treatise dealing with the subject of armature windings in all its generality, but limits itself to the consideration of windings in actual everyday use. The book then is intended rather as a help to the student than as a book of reference for the specialist on the subject.

The treatment throughout is simple and clear, and is, as far as is possible, non-mathematical. The subject is one which can best be made clear by introducing a large number of illustrations. The author has well realised this with the result that the illustrations are quite a prominent feature of the book. In all, there are over 200 figures. Of these, the majority are line diagrams, the remainder being photographic illustrations of actual windings and winding formers. The line diagrams are in every way excellent, those of polyphase windings being printed in three colours. The photographic illustrations are all well chosen, and have reproduced fairly clearly.

The book is divided into two main parts—continuous and alternating currents. Each of these parts is subdivided into the theoretical study and the practical realisation of the windings.

Dealing first with the continuous current portion, we note with pleasure that ring windings are only dealt with in so far as the study of such windings will enable the student to understand more easily the drum windings of the present day. The general theory and formulæ for lap and wave windings are stated clearly; we think, however, that more stress should have been laid on the fact that only certain combinations of slots and conductors can be used for wave windings without dead coils. Series-parallel wave windings are discussed at some length, and in an able manner. The method, due to Arnold, of representing these windings by an equivalent ring winding is the one employed. The need for equipotential connections and calculations connected therewith are both given. A useful little section on the choice of a winding and some examples of windings complete the theoretical study of this part of the subject.

The section dealing with the practical realisation of continuous-current windings contains much useful information. Quite a large chapter is devoted to the actual formation of the coils, many useful illustrations and diagrams of formers being given. There are also chapters dealing with the various shapes of slots and conductors in present use, plans and developments of the actual coils, and the testing of the individual coils and the finished windings. Altogether this section should give the student a very good knowledge of modern construction and methods.

In the alternating current section the first chapter deals, in a general way, with the production of alternating current. The second chapter is most valuable, and gives winding schemes for single and polyphase stators and rotors. The method adopted is to give one scheme per page, the chief

Digitized by Google

features of each arrangement being clearly set forth beneath the winding diagram itself. Wave windings, for both stator and rotor, are given, and also a few special stator windings such as are used occasionally. The manner in which this chapter is arranged is such as to make the whole subject as clear and as simple as is possible.

The chapters devoted to the practical realisation of alternating-current windings follow much the same lines as those dealing with continuous-current windings. There are many carefully chosen photographic illustrations which should be of very great help to the student. We think it would have been well to have included a short section on the methods of supporting the end connections of stator windings, as this matter is of vital importance with high-speed alternators.

However, enough has been said to show that this book is a valuable addition to the literature already published on armature windings. It should be of great service to the student of the subject. A. E. C.

RAIL-LESS TRACTION AT BRADFORD.

On Saturday last, June 24, a public service of rail-less trolley vehicles was commenced at Bradford, which city shares with Leeds the distinction of being the pioneers of rail-less electric traction for public service in this country. In spite of the weather conditions on Saturday last being most unfavourable, heavy rain falling throughout the day, the service was run most successfully, no hitch whatever arising. A joint formal opening of both the Bradford and Leeds rail-less systems had taken place on the previous Tuesday (see our last issue, p. 434), but the public service could not then commence owing to the sanction of the Board of Trade not having been received.

It will be remembered that before embarking on a rail less trolley system the Bradford Corporation sent a deputation to the Continent to investigate the operation of the systems there installed. In view of the favourable report of this deputation, powers to equip several routes were sought in the 1910 session of Parliament; and when these were obtained the work was rapidly pushed forward with the result that the first route has now been successfully opened. This route should provide the Tramways Committee with useful experience as to the capabilities of rail-less traction under the conditions prevailing in this country.

The vehicles at Bradford, of which illustrations are given in Figs. 1 and 2 herewith, have been supplied by the Rail-less Electric Traction Co., of London, to the joint specification of Mr. C. J. Spencer, general manager of the Bradford Corporation Tramways, and Mr. J. B. Hamilton, general manager of the Leeds Corporation Tramways. Seating

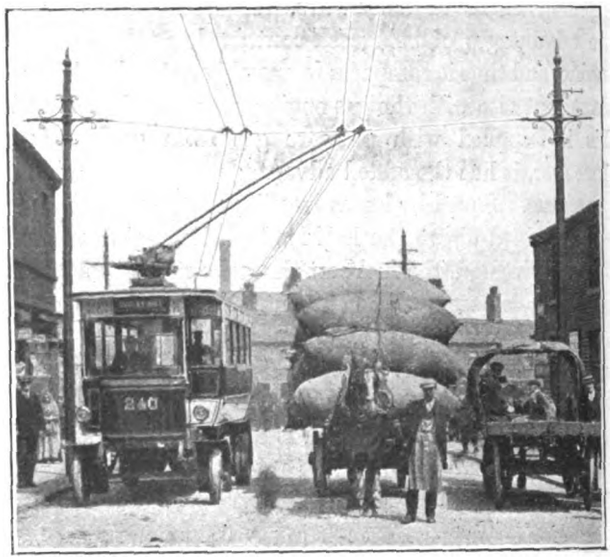

Fig. 2.—Rail-less Trolley Vehicle passing two Lorries.

accommodation is provided in each vehicle for 28 passengers, the ratan spring seats being arranged transversely. The wheel base of the car is 13 ft., and the overall width 7 ft., the distance between the centres of the rear wheel track being 6 ft. 3 in. The steering is arranged so that the vehicle will turn round in a radius of 12 ft. measured on the inner rear wheel. Two sets of brakes, operated by a foot pedal and side lever, are provided, one set acting directly upon the rear wheels and the other on a drum on the countershaft. This countershaft is driven through worm gearing by the motors, and drives the rear wheels by means of sprocket wheel and chain.

Each vehicle is fitted with two 20 H.P. motors of the Siemens interpole traction type with shunted fields, and runs on rubber-tyred wheels.

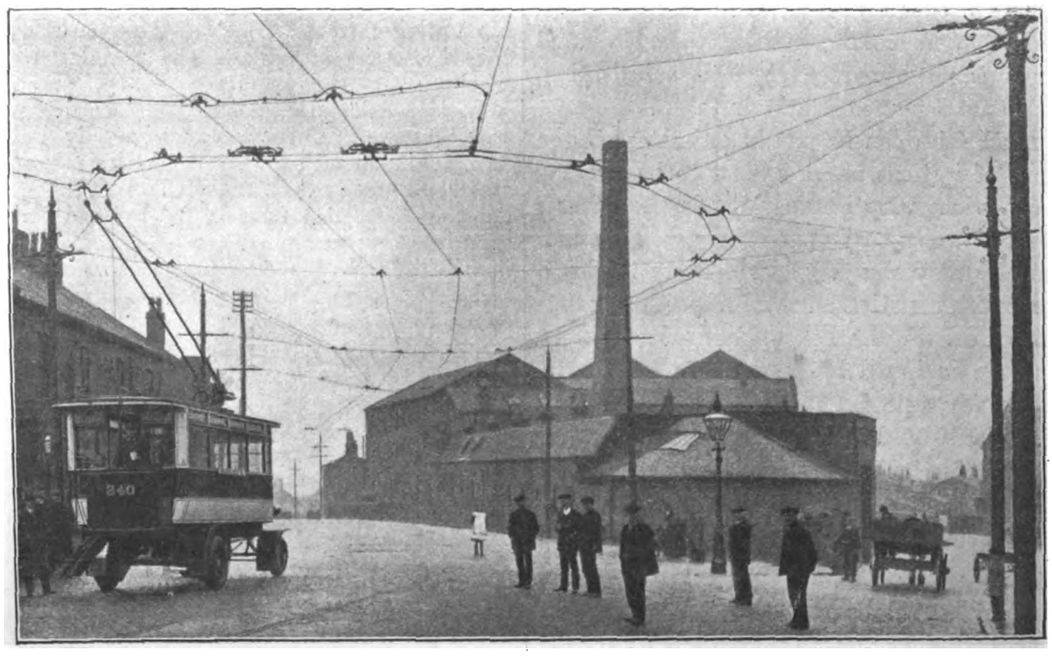

Fig. 1.—Rail-less Vehicle at Laisterdyke Terminus.

Digitized by Google

The route on which the rail-less system has been installed is about 1¼ miles long and extends from Laisterdyke, on the Thornbury section of the tramways, to Dudley Hill on the Wakefield-road section. Side poles and span wires have been adopted, and as will be noticed from the illustrations herewith, the poles are of simple design, no ornamental bases being used. The feature of the system, of course, is the use of two overhead wires, the second being necessary owing to the absence of the rail return in the case of an electric tramway. An important advantage, however, is that the equipment can be easily removed to other routes in the event of the service proving unprofitable, or of an electric tramway being installed.

The route differs from those to which rail-less vehicles are usually particularly adapted, in that it lies in a densely populated district. It serves, however, to link up two important tramway routes, and if successful the system is likely to receive further applications where cheap construction is desired.

The illustrations indicate the great advantages of the rail-less system in regard to passing obstructions such as slow moving vehicles, which are apt to cause serious delays in the case of a tramway. Fig. 1 shows a view of the curve at the Dudley Hill terminus, which allows the vehicle to be easily reversed; whilst Fig. 2 illustrates the vehicle passing two laden lorries, the three vehicles occupying the whole width of road. This indicates the extreme flexibility of the system.

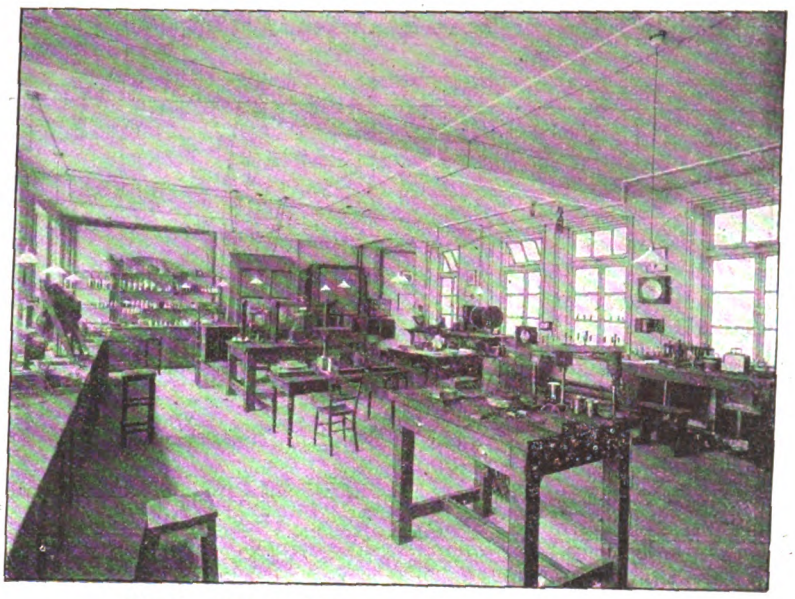

Fig. 2.—Another View of the Standardising Room.

THE FARADAY HOUSE TESTING LABORATORIES.

When Faraday House was founded by the Earl of Crawford, Mr. Robert Hammond and Mr. Francis Ince, rather over 20 years ago, its operations fell naturally into two classes, one of which had for its object the education of the young engineer and the other the provision of an independent testing authority.

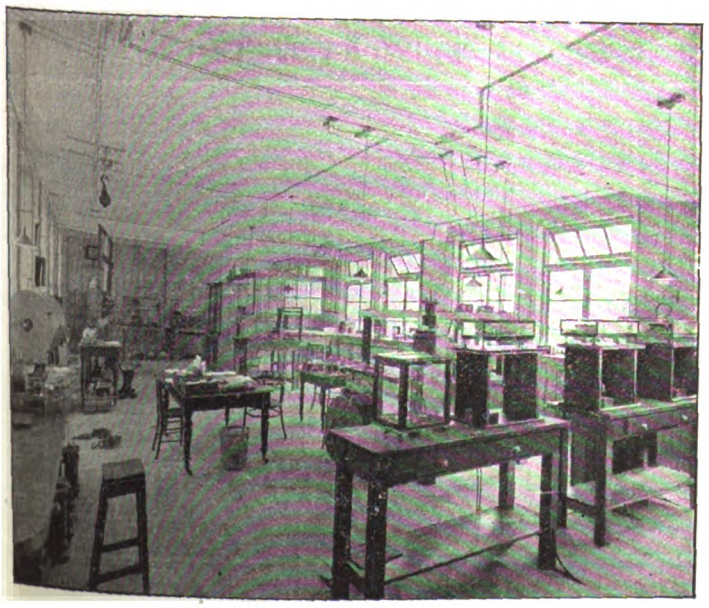

Fig. 1.—The Standardising Room.

Both these branches are still in full swing, and the original distinction between the two is still maintained. In reality, the only inter-connection that exists between the training college and the testing laboratories is that they are under the same roof, and that the staff of the former act in a consultative capacity to the latter. We propose in this article to give some account of the testing laboratories at Faraday House, and to devote a later article to the consideration of what the other part of the institution does towards training electrical engineers.

The importance of some such testing institution as Faraday House to the electrical profession and industry cannot be overrated. It is very often useful for an engineer to be able to obtain reliable and independent information concerning the merits of similar instruments and which one is best suited to his particular requirements. They may all be excellent in their various ways; and their various makers will doubtless emphasise this excellence in their catalogues. But by sending them to Faraday House, the engineer will not only be able to ascertain their respective merits, but will discover which is the best suited for the work he wants it to do.

The accompanying illustrations (Figs. 1 and 2) show two views of the main standardising room, which is situated on the first floor at Faraday House, in Southampton-row, W.C. The total area is 1,500 sq. ft., while an annexe, 34 ft. long and extending the whole width of the floor, is provided for photometrical work. The department is supplied with the necessary electrical energy from the institution's own generating plant and batteries, both direct and alternating current being available. The services are brought directly into the test room and consist of three-wire direct and alternating-current mains, as well as a two-wire direct-current supply. The battery room is on the second floor and the generating plant in the basement. In addition three separate services from the neighbouring electricity supply companies are available. The institution's own plant provides direct-current and also single, two and three-phase current at any frequency between 25 and 100. Three-wire services of both direct and alternating-current are brought into the laboratory from the supply companies, as well as a two-wire 500-volt circuit.

The wiring in the standardising room consists essentially of three pairs of mains running round the room, these mains being connected at intervals to terminal boards on the various benches. One wire of each main is looped into a small plug board to which all the Kelvin balances are permanently connected. By this means the current in any main can be connected to any ampere balance or standard resistance without breaking the circuit. In addition there are several other circuits running from the main switchboard for use in various parts of the laboratory. Every testing circuit can be connected

Digitized by Google

to any source of supply by means of lugs at the switchboard. For distributing small currents a system of ordinary wall plugs has been devised and has been found most useful as regards its general adaptability to all classes of work. For large currents a battery of four accumulators is used, whose ultimate capacity is 2,000 amperes over short periods. For similar alternating-current work there is a transformer from which 1,000 amperes at 5 volts can be obtained.

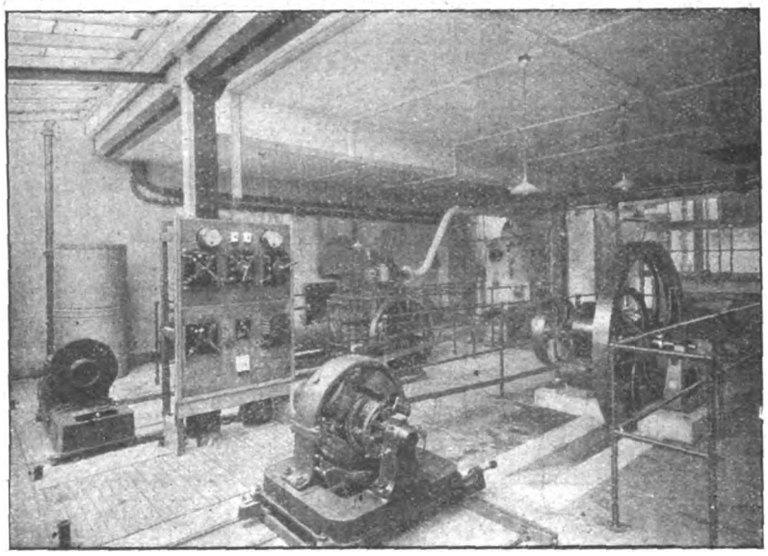

FIG. 3.—THE DYNAMO ROOM.

The photometer room is equipped for testing arc lamps and glow lamps as well as gas and oil burners. Life tests are taken at four pressures between 18 and 100 volts, and at three pressures between 100 and 200 volts. For cable work a Kelvin galvanometer is used, the table carrying the scale being fitted with a tank. One bench is equipped solely for iron and steel testing, while another is employed for extra high-tension work. In designing this plant the aim throughout has been to have all the apparatus for standard tests permanently connected up, and thus to avoid delay inevitable if any other arrangement is used.

Turning to the actual tests undertaken at the laboratory we may consider first the electrical section. Under this heading ammeters and voltmeters for commercial use are tested for accuracy within 1 per cent. of their maximum scale reading at a very low fee, while ammeters, voltmeters and wattmeters are calibrated for use as sub-standards, five points on the scale being given.

At the present time much interest is being taken in the problem of illumination, and it is, therefore, satisfactory to find that adequate photometric appliances are available at Faraday House. As mentioned above, a special standardising room is set apart for this work, where the usual apparatus in the way of photometers, measuring instruments and standard lamps are provided. If a lamp is required for use as a secondary standard, it is first "aged" and afterwards tested for candle-power. It is then run on the circuit for a few hours and again tested. Tests are made on arc lamps especially with regard to the candle-power and consumption of the carbons.

Both from the supply authority's and customer's point of view the accuracy of integrating meters is of importance. Special arrangements are therefore made at Faraday House for testing these. When it is realised that for over 20 years Faraday House has been appealed to in numberless cases where the accuracy of a meter has been questioned, it will be readily conceded that their experience is second to none in this class of work. It is gratifying to learn that the Board of Trade has appreciated the unique position occupied by Faraday House in this direction, and has appointed the Principal, Dr. Alex. Russell, electric inspector for no less than eight districts.

In connection with recent developments in the use of high electric pressures, both direct and alternating, special plant has been installed for measuring the electric strengths of insulating materials, and the information obtained from these tests is of great value to engineers. An entirely new method of measuring high voltages is being perfected. A unique feature of the work undertaken by this institution is the carrying out of mathematical calculations and investigations which during past years have resulted in improvements and economies in engineering work.

Samples of steel or iron for dynamos, transformers, instruments, &c., are tested for hysteresis loss and permeability, while wire and cables are also submitted to the usual tests for conductivity, insulation and capacity. Similar tests, which are sufficient to discover the suitability of the apparatus for the work it has to do, are made on lighting accessories, primary batteries, accumulators, tramway accessories and lightning conductors, while the staff also undertake the inspection of installations of electrical plant and machinery. Tests are also made on dynamos, motors and internal combustion engines, while investigations on the wide range of materials commonly in use for electrical purposes are also carried out.

Another branch of the institution's work is that dealing with the chemical analysis of dielectrics used by cable manufacturers. In addition to the testing work carried out, the institution provides on hire a complete set of instruments suitable for a wide range of purposes, so that engineers can make the measurements they require without being put to the great expense of purchasing new instruments. A further useful feature is that private workshops are provided on the premises at Faraday House, where inventors can carry out their investigations, having at the same time well-fitted carpenter's and engineer's shops at their disposal.

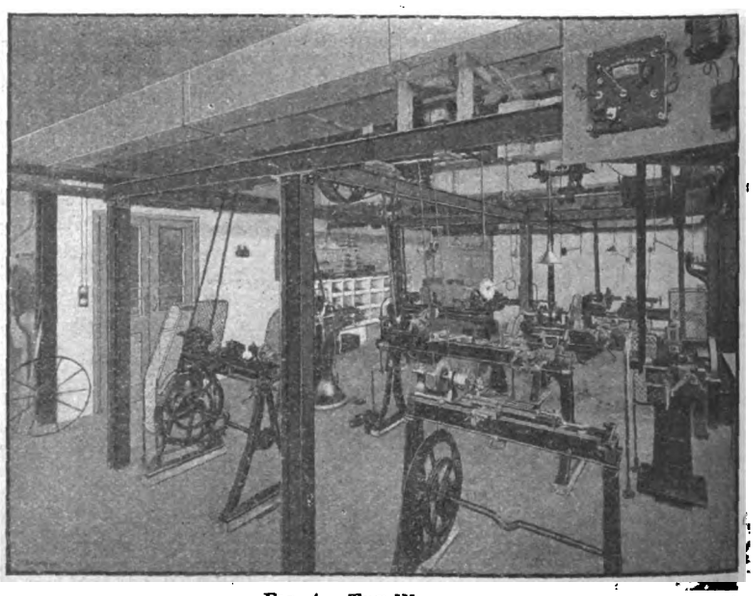

FIG. 4.—THE WORKSHOP.

It will be seen that the Faraday House laboratories fulfil a most useful function in the electrical engineering industry, and, at the same time, the institution has the advantage of occupying an entirely independent position, which is, of course, essential in carrying out work of this kind.

CORRESPONDENCE.

LIGHT AND SHADE IN INDIRECT LIGHTING.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: Mr. Justus Eck, in his valuable contribution to your issue of the 23rd inst., suggests that the objection I put forward to indirect lighting, viz., lack of contrast, does not exist, and proceeds to give as proof of his remarks the figures and photographic reproduction of a case of inverted arc lighting. Might I be allowed to suggest that this is again a confusion of terms. Inverted arc lighting can hardly be described as indirect lighting in the sense that I used that term, as the only thing in common is the fact that the actual arc is invisible. By indirect lighting I meant illumination derived from all directions. This is not the case in the room described by Mr. Eck; the illumination of the ceiling and the light derived therefrom was nearly 20 times that from the floor—hence a shadow factor of 97, which, as he correctly remarks, is an excellent result.

If Mr. Eck had replaced the inverted arc lamp by a light source giving equal candle-power in all directions and only shaded from the sphere by a small horizontal disc, the sphere would have had the same appearance as the vertical disc and the shadow factor would have been very near unity, which, of course, is the result one wishes to avoid.

This fault not only applies to indirect lighting, but also to shaded artificial illumination where lamps are placed indiscriminately in all directions; but it is one which never applies to inverted arc lighting, this being as a rule most successful when illuminating vertical objects.

The example of illumination given by Mr. Eck is an extremely good one, and there is only one small detail I should be tempted to alter, viz., to place the inverted arc near the window, which, if white blinds were used, would result in the windows at night by artificial light being in practically the same position as in the daytime, and not vertically below the objects in the centre of the room, thus producing a somewhat curious effect very rarely found in Nature.

I trust that this explanation will result in Mr. Eck exonerating me from any condemnation (by implication or otherwise) of inverted arc lighting, which is a system of illumination I strongly advocate when circumstances permit.—I am, &c.,

Westminster, June 26. HAYDN HARRISON.

"A NEW METHOD OF HARMONIC ANALYSIS."

TO THE EDITOR OF THE ELECTRICIAN.

SIR: I notice in current issues of the technical Press short abstracts of a Paper read by Prof. Silvanus P. Thompson at the meeting of the Physical Society on June 9. The Paper in question is entitled "A New Method of Harmonic Analysis by Averaging Selected Ordinates." As far as I can judge from a brief abstract, the method is, however, by no means new. It is, in fact, none other than the method published by Fischer-Hinnen in 1901 ("E. T. Z." XXII., p. 396; "Ecl. Elec." XXVIII., p. 422), and worked out in greater detail and with many illustrative examples in a later Paper ("Electrotechnik u. Maschinenbau," XXVII., p. 335, 1909; "Lum. Elect," VI., p. 177, 1909). In my laboratory instruction sheets I have for many years past described Fischer-Hinnen's method in the precise form given by Prof. Thompson. Indeed the method has so long figured in several well-known text-books, and has so often been discussed in periodical literature (*see*, for instance, P. M. Lincoln, "The Electric Journal," July, 1908) that to most persons interested in such matters it must be quite one of the most familiar of the many graphical processes of harmonic analysis.

But perhaps Prof. Thompson bases his claim to novelty upon the use of templates. The use of templates in various forms as aids to harmonic analysis is, however, a matter of ancient history, and, so far as Fischer-Hinnen's method is concerned, I had such templates as Prof. Thompson describes made, and used them for class demonstration purposes, shortly after the method was first published.

As is well known, the chief objection to Fischer-Hinnen's method is that it does not directly give the lower harmonics—particularly the fundamental. The reciprocal-sine diagrams recently described by me in THE ELECTRICIAN possess, on the other hand, the valuable property of giving any harmonic directly by simple addition. They can therefore be used even by the mathematically unskilled, and any intelligent typist, provided with a typewriter having an adding attachment, can, with their aid, be instructed to perform satisfactorily the duties of a "harmonic analyst."

There is, it has always seemed to me, another objection to the method as described by Fischer-Hinnen, and in practice I prefer to carry it out in a slightly modified form; but this I shall not discuss at the moment.

It is, of course, most useful to have an account of Fischer-Hinnen's method in Prof. Thompson's characteristically clear style, but it cannot be described as novel.—I am, &c.,

The University, Manchester, June 24. R. BEATTIE.

We have submitted Dr. Beattie's letter to Prof. Silvanus Thompson, from whom we have received the following reply:

TO THE EDITOR OF THE ELECTRICIAN.

SIR: By your courtesy which permits me to see Dr. Beattie's letter, I am able to reassure your readers. While admiring the hardihood of Dr. Beattie in condemning my Paper on "Harmonic Analysis"—which he has not seen—on the strength of the brief abstract report of it which has appeared in the Press, I may be permitted to traverse his hasty conclusions. The article of Mr. Fischer-Hinnen of 1909, to which he alludes, is quite well known to me—in fact, Mr. Fischer-Hinnen himself sent me a copy when it was published. It certainly uses selected ordinates; but so do the anterior methods of Strachey and of Baird. To admit this does not exclude the admission that there is novelty in the development due to Fischer-Hinnen, nor bar the possibility of the further development which there is in my yet unpublished Paper. The simple fact is that all these various methods are evolved from the fundamental integrals given 80 years ago by Fourier. Why should I deny the indisputable proposition that there is nothing new under the sun?—I am, &c.,

SILVANUS P. THOMPSON.

Technical College, Finsbury, E.C.

THE TELEPHONE POSITION.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: The instant and earnest attention of telephone subscribers throughout the Kingdom is imperatively necessary if their interests are not to be utterly and irretrievably ruined.

The statements made by the Postmaster-General to a House, described by one authority as "thin" and by another as "attenuated," on the eve of a national event so absorbing as to prevent any attempt at serious debate, call for the closest examination and criticism.

The Postmaster-General said that there was no demand for Municipal control of telephones except from Glasgow. But it was only at the end of last February that a deputation representing some 300 responsible Councils and Chambers of Commerce pressed this very matter earnestly on his attention!

Mr. Samuel asserted that only six Municipalities established telephone systems, and of these only two survive. Candour—I am not charging Mr. Samuel personally with the lack of it—might have added a great deal to that bald statement. Municipalities are properly deliberate in entering new fields of enterprise, and in the case of the telephone this natural hesitation was increased by the extraordinary steps which were taken to intimidate them from moving, by exaggerating difficulties, detracting their advisers and prophesying disaster. This was done by never-ceasing articles and correspondence, mostly anonymous, in the Press, by circulars, by pamphlets, by books (two were actually published and circulated gratis), and by destructive evidence given at Local Government Board Inquiries. Those Local Authorities which did go in may there-

Digitized by Google

fore justly be complimented on their courage. But by 1905 sufficient experience had been accumulated to show the falsity of the croakings, and that a cheap and efficient telephone service could be provided for something like half the customary rates. Wide spread interest was aroused by the published balance-sheets of the municipal undertakings, and it was evident that locally-owned telephones were on the eve of considerable extension, when the Post Office took steps to purchase the National Telephone Company's system, several years before any such movement was necessary seeing that the Company's licence had still six years to run. Having done this they refused to grant any more municipal licences, and several pending applications necessarily fell to the ground. It is interesting to note that the Select Committee on the purchase question went minutely into the merits and results of the municipal systems and embodied a recommendation that they should be continued in their Report. Succinctly, the Post Office did everything possible to impede municipal telephones, and when that policy was on the eve of failure through the success of the existing systems stopped further development by purchasing the National Telephone Company and refusing licences.

Mr. Samuel likewise told the House that of the six—he should have said seven—exchanges inaugurated by Local Authorities only two survive. Three is the proper number, however—Hull, Portsmouth and Guernsey. Of the other four, three—Brighton, Glasgow and Swansea—were killed by the set of circumstances created around them by the Post Office, circumstances which rendered it impossible for Brighton to continue the business, and which threatened the others with such a strong probability that they would be faced with heavy loss of capital on the expiry of their licences that prudence called a halt and forced a sale.

The Corporation of Brighton, which had established an efficient Exchange at less than half the rates previously in force in the town, were refused permission to expend any portion of their telephone loans in the adjoining borough of Hove, which for telephone purposes is quite inseparable from Brighton, although under both the Act of 1899 and their licence they were fully entitled to telephone Hove and had the consent of that Borough to do so. Competition with the Telephone Company was rendered impossible by this decision and the exchange had to be sold.

The Corporation of Glasgow, which, with the view of strengthening the Post Office in its deal with the National Telephone Company and for no other reason, had elected to take a licence for 13 years only, naturally assuming that it would be extended to the usual term, was refused a prolongation beyond 1913, not in so many words, it is true, but still to all intents and purposes refused. The consequence of this breach of faith and of certain advantages given by the Post Office to the Company in the Purchase Agreement, against which all the Corporations had vainly protested before the Agreement was signed, was that the Corporation was intimidated and, wrongly, I have always thought, parted with its undertaking. It was certainly impossible to repay its capital by 1913, the date to which its licence extended, and at the same time maintain the cheap rates for which it had been established, and the timid ones had their way.

Enquiries at Swansea would elicit the information that they were also forced out of the business by the Government. The Corporation there had established an efficient exchange which was paying its way on very low rates, but decided that it could not contend against the hostility shown it by the Government.

Three independent systems remain. Of these Guernsey has done so well under local control that it possesses the largest exchange in the Kingdom in proportion to population, London, Glasgow, Liverpool and the other great commercial centres not excepted. It gives an exclusive line to each subscriber, and makes the enterprise pay splendidly on an average receipt of £3. 6s. per telephone, out of which 10 per cent. is paid to the Post Office in name of royalty. For £5 the subscriber can call as often as he likes. The exchange is open day and night, while the Post Office telegraphs are hermetically sealed at 9 p.m. On the occasion of the death of his late Majesty the news reached the Island by military wireless, and was disseminated by the telephone exchange many hours before the Post Office opened the following morning.

The Corporation of Hull has successfully defied all efforts—and they have been many—to stop its telephonic enterprise, which continues to extend in spite of opposition, telephones in competition with it being supplied at 25s. per annum under Post Office permission. The municipal service, which has earned a world-wide reputation for efficiency, costs only £4 per annum on the average; £6. 6s. per annum for a business, and £5 for a private house, enables a subscriber to call as often as he likes. The exchanges are open day and night, and there is no charge for the junction wires to neighbouring towns.

The Corporation of Portsmouth is the third. It has also had to fight 25s. telephones, but has come through the ordeal well. It possesses an efficient system covering all the adjacent towns and villages, the use of the junction wires to which are included in the local subscription of £5. 17s. 6d. per annum which covers an unlimited number of calls. The smaller subscribers, like those at Guernsey and Hull, have the choice of several cheaper rates, and the system pays on an average revenue of £4 per annum. Like all the municipal exchanges the service is continuous day and night.

These three Local Authorities have not fainted by the way. They have performed a very great national service, although Parliament and the public are pleased to ignore the fact, in demonstrating that the proper capital cost of an efficient telephone system is £20 per telephone, and that an average receipt per telephone of £4 per annum is all that is required to make it pay.

Is it fair or in the public interest that they should be devoured and their efforts treated as of no account? Are their cheap rates to be discontinued? There is very great danger of it, for to the Post Office cheap telephones are anathema, and it is the Local Authorities which have proved that they are practicable.

There are no applications for new municipal licences simply because the Post Office have definitely announced that none will be granted. Who could doubt that after what has been effected the renewal of licences would be welcomed by the Local Authorities and largely taken advantage of?—I am, &c.,

Westminster, June 28. A. R. BENNETT.

[We regret that owing to pressure on our space it has been necessary to hold over some correspondence.—ED. *E.*]

SIXTEENTH ANNUAL CONVENTION OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION.

(*Concluded from page 461.*)

Brighton, Thursday, June 29th.

DISCUSSION ON PURCHASE OF FUEL—*Continued.*

Mr. SHAWFIELD, continuing, said: In the Midlands he fou it better to contract directly with a colliery, but in the No of England it was the practice to contract with agents. In deali with agents one had, perhaps, a larger range of collieries, and dealing with a colliery one was perhaps confined to one class of fuel, l in the latter case some control could be exercised over the quality. own Corporation made contracts annually, but for the last five or years they had purchased a definite quantity, 20 to 50 thousand tc according to the state of the market and the requirements of the stati When power contracts had to be considered that method was prefera Purchase on the basis of calorific value was an ideal method of p chasing, but in dealing with agents there might be insuperable d culties, although it was perhaps feasible when dealing with one or m collieries directly. It was, however, necessary to educate the colli owners up to this. He believed that Mr. Rider entered into a contr somewhat on that basis with satisfactory results, but in that case believed the contract was for the coal as delivered at Greenwich and as it left the colliery, which should be the basis for the coal ow Every central station should have a coal testing department, tests should also be made under the boilers. At Wolverhamp they had had such testing apparatus in use eight or nine years. The cost was about £10 or £12, and the annual expenditure in time

Digitized by Google

material for taking daily tests was about £20 to £25. The result of installing the apparatus was an annual saving in fuel cost in the first two years of about £500 a year, simply owing to the improvement of the quality of the fuel. Testing laboratories might be established, and jointly controlled by the purchaser and the consumer. The payment for fuel should be based on its calorific value. He hoped to have that system in operation in the course of a few months. Another factor affecting the price of coal was wages. He had found it necessary to have a wages clause as follows :—

> The prices quoted in this contract are to be based on the present standard rate of wages as agreed upon between the colliery owners and the Miners' Federation in the federated area in England. This standard is hereby declared to be 50 per cent. above minimum. For every 2½ per cent. on the minimum variation from the present standard it is agreed that there shall be a corresponding increase or decrease upon the contract prices of the fuel. Such variation to be calculated as 2d. per ton for each 2½ per cent. variation in the rate of wages.

Colliery owners were thus protected against loss by increased wages. Legislation also had a considerable effect on price and quality of fuel. Immediately after the Eight Hours Act was passed about two years ago he noticed that in the South Staffordshire district there was an increase of 5 and 7 per cent. in the amount of incombustible contents in all fuel delivered, and he had serious trouble to get it rectified. The state of trade was impossible to foresee, but it was probable that would tend to increase the price of fuel during the next year or two. The price of low quality slack appeared to rise and fall in cycles of about four years, and he was led by his observation of this matter to think there might be a slight increase for the next three or four years.

Mr. F. Newington (Edinburgh) said that when he tested his fuel for moisture some two years ago the opposition of the merchants was very strong; they charged more for the drier fuel, and he did not think it was worth doing. Buying on a calorific basis would tend to increase the price of fuel artificially, and would, he thought, never come to pass. Coal would always fetch what it was worth. In Scotland they never dealt with collieries, but only through agents, who acted as a safeguard against strikes. No matter what result was obtained from calorimeters, the test of fuel under boilers was, after all, the real test. It might even be better to arrange a special boiler under which the tests could be regularly made.

Baillie Willock (Glasgow) said that the local conditions absolutely governed the question of coal supply and the choice of a suitable fuel. In Scotland they always sorted coal by machinery, and the class of fuel supply to electricity works was known locally as "pearls." Glasgow Corporation had adopted this class of fuel in 30,000 ton lots at 11d. per ton less than the single nuts which they had formerly used. It was better to deal with agents, because a coal-master always shut down his colliery in case of strike.

Mr. Ayton (Ipswich) said that the ideal method of purchasing fuel was on the heat units basis, but merchants would have to be educated up to it. He had made inquiries at the London Coal Exchange as to the opinion of masters and agents respectively of this method. The former were comparatively indifferent, while the latter who purchased at fixed prices would have to take all the risk of rejection, and covered themselves with increased prices. He hoped none the less that the large undertakings would continue the policy of educating coal suppliers in this direction. He instanced the L.C.C. Greenwich power station and that of the Underground Railways of London at Lot's-road, who both purchased fuel (about 150,000 tons a year) on a calorific basis. The specification of the L.C.C. occupied 11 printed pages, and that of the Underground Railways a half sheet of foolscap of 159 words. He thought that the Company's engineer was probably purchasing on a better basis with his extremely simple specification. As to the calorimeter tests which the L.C.C. chemist carried out, it seemed to him that the coal was half burned before the tests were completed. At the Underground Railway's station the engineers simply checked the coal for size and dust. Mr. Towle, resident engineer, Lot's-road, used the Berthier test, which took 20 minutes and cost 1½d. The test was as follows :—

> "Weigh out 1 gramme of finely powdered dry coal, mix with about 60 grammes of lead oxide (litharge free from silver), also mix, say, 15 to 20 grammes of glass powder (coarse). Put this in a Battersea clay crucible and cover with a layer (tablespoonful) of common salt, and heat in a forge fire or otherwise for about 20 minutes at a bright red. When cold, break crucible and extract the lead button from the bottom, clean off slag, then weigh and multiply its weight in grammes by 483. This will give the calorific value of the coal in B.Th.U. per pound. The constant 483 is worked out from the atomic weights and calorific values of the various constituents of the coal."

In the purchase of his fuel he dealt with agents, and obtained contracts for 12 months. He thought that the real test for fuel was after all that under the boiler, and the tests should not occupy a few hours, but should extend over several weeks.

Mr. Faraday Proctor (Bristol) pointed out that the scale of payment varying with the rate of wages (as specified by Mr. Shawfield) did not give the same variation for the coal owner as for Mr. Shawfield. The latter benefited more if wages went up, and the reverse if wages fell, and this might tend to a variation of wages. With regard to buying on a calorific basis, he found that Welsh coal owners would not quote in that way.

Mr. E. E. Hoadley (Maidstone) had tested numerous barges of coal by sending carefully taken samples to three testing laboratories. The results from these laboratories differed so much among themselves as to be worthless. In addition he made 24-hour tests under boilers, and found that coals having same calorific values within 1 or 2 per cent. gave very different results under the boiler. He now relied upon boiler tests, and bought on his general experience so obtained.

Mr. Christie said that at Brighton they used Scotch washed singles, which came in 700-ton barges, and was weighed and checked at the wharf. Calorific tests were also made, but they chiefly relied on the actual quantities burned under the boilers each day per unit generated. He recommended reinforced concrete bunkers, because they were free from rust and fire risk.

Mr. R. A. Chattock (Birmingham) was of the opinion that more heat was returned to the boiler from the clinker than was suggested by Mr. Shawfield. Personally, he preferred unwashed to washed coal, owing to the difficulty of drying the latter. He was also of opinion that it was better to deal with agents than with coal owners in getting coal for large towns. Indeed, he generally found that he was able to get no better prices from collieries direct, and as there were numerous agents competition was not lacking. With agents there was the advantage that one obtained a large range of collieries with which to deal. Coals of the same calorific value varied considerably from one another when tested under boilers. It was desirable to run tests continuously, both laboratory tests and boiler tests. At Birmingham they tested many varieties of coal besides the particular quality in use. In fact, one boat-load of new coal was tested every week and two boat-loads of the contract coal. They had a very complete testing department, and by this means they had reduced the average cost of coal from 8s. to 6s. 10d. per ton; the amount of ash had fallen from 21 to 14 per cent. and the cost of fuel per unit generated from 0·18d. to 0·14d., a decrease of 22 per cent. during a period of about three years. They now had very complete information about 130 different classes of coal in their neighbourhood, and therefore they knew pretty well what they were buying. By means of constant boiler trials they were now able to maintain an average thermal efficiency of 65 per cent. in the boiler house, including all losses, as compared with 80 per cent. obtainable on a full-load boiler test. The testing department cost about £400 per annum, including the salaries of the chemist and assistants, but the total cost of the coal burnt last year was £23,500, so that the cost of the testing department was only 1·7 per cent. of this sum. Their plan was fully justified by the saving effected. He did not think a testing laboratory could be jointly run by the colliery and consumer as it would lead to complications and would limit the market. In conclusion he, emphasised the extreme importance of testing both new coal and contract coal, but local conditions must always be taken into account.

Mr. H. H. Broughton, in a written communication, thought that the fact that electric supply undertakings could show a profit at all was highly creditable, when one remembered that of the total works costs the coal alone accounted for more than one-half, of which 90 per cent. was lost. The method used by the United States Geological Survey involved a determination of everything which affected heat value, and he advised engineers to refer to a Paper on "The Purchase of Coal under Specification," by Mr. J. E. Woodwell. Sampling by hand was unsatisfactory; for small coal it was better to use a sampling ram, and a 5 ft. length of 2½ in. steam tubing, with inwardly projecting studs at the lower end to retain the sample, answered the purpose very well. Large consumers would find it necessary to take into account not only heat value and percentage of ash, but also percentage of moisture, volatile matter and sulphur. Small consumers would be adequately protected by heat value and percentage of ash tests. He thought coal consumers would do well to secure the co-operation of a technical college provided with the necessary apparatus. Large consumers, however, would find it better to have their own laboratory. An alternative to laboratories at each supply station would be for several large stations to combine and equip laboratories at each of the large colliery centres.

Mr. Shawfield, in reply, was surprised that engineers were doubtful about methods of checking the quality of coal supplied to their stations, and wondered if they were as chary in checking the selection of turbo-machinery and plant. Baillie Willock was quite correct in stating that the matter was decided mostly by local conditions. Replying to Mr. Faraday Proctor re the wages clauses, he thought that the Coal Owners' Association, or whatever body fixed the rate of wages over the federated area, would hardly change the scale on his account. No one colliery owner could alter the wages on his own responsibility.

Discussion on Street and Shop Lighting.

Mr. A. Hugh Seabrook (St. Marylebone), in opening the discussion on "Street and Shop Front Lighting," said he proposed to leave the first part of the subject to Mr. Haydn Harrison. With regard to the competition of high-pressure gas in street lighting, in West Ham the Corporation had introduced an inclusive hiring scheme at £2. 1s. per quarter per lamp of 500 watts; the gas company had introduced a corresponding scheme which led to severe cutting of prices. The £2. 1s. was a remunerative price after the first two years when the cost of the lamps had been recouped. He recently went along the Barking-road, which took in the poorer districts of West and East Ham. East Ham also had an inclusive scheme, and their charges were less than those of West Ham. In the portion of Barking-road in West Ham not a single high-pressure gas lamp had been erected during the two years, since he left there, whereas he saw many in the East Ham portion. There was the same gas company in both districts, and he thought the reason West Ham kept its business, although their charge was higher than that of East Ham, was that it had an efficient business-getting department, and East Ham had not. Different districts, of course, had to fix their charges according to their conditions. In Marylebone they had to charge higher prices than in West Ham. With a 500-watt lamp at 3½d. per unit it was possible to supply a series

Digitized by Google

of four arc lamps on the direct-current system, each of about 1,000 c.p., at a cost to the shopkeeper of 2d. per lamp per hour, or £30 for the four lamps per annum for 900 hours' burning. The gas people in London offered about 30s. a quarter for high-pressure gas, and sometimes as low as 25s. or 20s. for gas lamps of 1,000 c.p. The charge of 30s. is equivalent to £60 a year against £30 for arc lamps, excluding cost of wiring. Even after adding the cost of the wiring this still showed a slight advantage over the high-pressure gas. A useful lamp was a 4½-ampere flame lamp, which had just come out, and which enable them to cut their cost considerably because they could put in a flame arc lamp of greater candle-power than the gas lamp they had to compete with. This could be supplied at 1·35d. per hour, including current, trimming, supply of carbons and cleaning, or a total of £5 per lamp of 1,200 c.p. for 900 hours.

The detailed costs per lamp of the first mentioned were :—

	Per hour.
Maintenance and Current	1·4d.
Carbons, including wages, breakages, &c.	0·3d.
Trimming and cleaning	0·17d.
Establishment charges	0·13d.
Total	2·0d.

The detailed costs of the 4½-ampere arc lamp came out as follows :—

Maintenance and Current	0·79d.
Carbons	0·24d.
Trimming and cleaning	0·17d.
Establishment charges	0·15d.
Total	1·35d.

These figures made no allowance for current wasted in line resistances and this was not necessary with modern lamps. He believed Mr. Harrison had in his mind the joint arrangement between the gas company and the Metropolitan Electric Supply Co. for lighting Holborn, and that he intended to suggest that the electric light undertakers might keep up their shop and private lighting by some similar co-operation. He (Mr. Seabrook) was absolutely against anything of the sort. He preferred to keep his opponent where he could see him. The gas industry was better organised than the electric supply industry. From the commercial point of view, too, they were superior and the electrical industry was not in a position to play fast and loose and give them an inch in any way.

Mr. HAYDN T. HARRISON said the position of electric lighting in the street was becoming extremely interesting on the question of cost and it was getting even more interesting on the question of competition with gas. He had come to the conclusion that, provided the conditions were equal at the start, there was no doubt electric light in the streets would give equal light at a much lower cost than gas, but the conditions they had to face were different. In nearly every town in which an electrical undertaking had been started there was already a gas supply which had been carried out without any competition. They got their own prices for a large number of years and had paid off practically every penny of capital in connection with their street lighting. They had no interest and sinking fund to allot to any particular mains, or anything of that kind. The electric lighting undertakings had, in many cases, not been allowed to borrow money for street lighting or they had been allowed to borrow it at a high rate of interest on a very short period, and so they had been forced to borrow out of revenue. In a large number of towns where this had been done the cost of electric street fittings had been or was being repaid in a short period like five years, and yet the undertakings had been able to put in prices for equal lighting to compete with gas. At Marylebone, if the loans for street lighting had been borrowed under ordinary conditions, they would have been able to give 50 per cent. more illumination than they had given. Mr. Harrison then explained the circumstances of the substitution of gas for 70 arc lamps in Westminster, about which, he said, there had been some misapprehension. The 70 lamps formed only a small portion of the street lighting, and half the streets that had been lighted electrically were still so lighted. The gas company's price put in on that occasion was the lowest ever put in for public lighting in this country. The gas companies used this incident as an advertisement, and the electric lighting companies made up their minds not to allow this to occur again. In Holborn the gas company sent in a price; it was suggested that the electric lighting companies should be asked to tender, and they put in a price which was considerably below the gas company. Eventually the gas and electric companies were asked to tender again. The conditions were so onerous that the managers of the companies came together and decided that they would not accept them unless the Council paid 10 per cent. extra. The Council were now going to pay a sum which was remunerative to the electric lighting and gas companies, whereas in other districts, where competition had been allowed to get to a cut-throat condition, the gas and electric people had had to take on contracts in which a profit could not be made. Lighting was practically a monopoly. There need only to be two parties to it, but in a lot of places the competition was divided between six, seven or eight. He thought the gas and electric lighting companies ought to be able to make an arrangement to take on the work they were particularly suited for at prices which would be remunerative to the shareholders, or, in a municipal undertaking, to the ratepayers. He did not quite see why one should be so afraid of the gas managers. He thought a stand-off attitude was a sign of fear more than anything else. With regard to tungston lamps, the grouping of them was an important matter. The Institution of Electrical Engineers, the Surveyors' Institution, the Gas Association and the Illuminating Engineers had joined in a joint committee to formulate a standard specification for public lighting, and it would almost certainly be based on minimum illumination. If you had to provide a minimum illumination and were allowed to choose your own units you had to consider what units were most economical. Leaving out very large and important streets like certain streets in the City, where they had 0·8 candle-foot, he found that units between 100 and 500 c.p. were economical, both in capital expenditure and maintenance, and efficiency For the smallest streets where the minimum illumination was as low as 0·002 or 0·001, the tungsten lamp placed in about the same position as the existing lamp-posts gave the most economical result. The next unit above that would probably be between 200 and 300 c.p., and that you could obtain equally well by grouping the 100 watt lamps so as to get a high degree of reflection. These could go up to 600 or 700 c.p. With such groups they could obtain 1·5 c.p. per watt, which was an effective efficiency in the street. At the usual rates of 1½d. down to 1d. for public lighting, even with high-pressure gas, with all its incidental charges for mantles and maintenance, your prices would come out very nearly equal, excluding the question of capital charges.

Mr. S. J. WATSON (Bury) stated that he had experimented with groups of three metal filament lamps each of 300 c.p. and sometimes 200 c.p. He found that such groups of lamps placed 70 yds. apart gave an illumination equal to that of flame arc lamps. Metal lamps had, of course, many advantages, including absence of trimming, and his experience was that they did not suffer from vibration even when placed on tramway poles. He used a conical opal inverted shade and did not believe in enclosing the lamps more than necessary.

Mr. J. R. DICK remarked that street lighting by means of metal filament lamps was considerably hindered by the policy of the Local Government Board in not granting loans for street lighting fittings. In Brighton such fittings had been in use for 16 or 17 years and were still good for further work. It would be a great advantage if a time switch could be obtained for 20s. to 22s. There were many excellent time switches on the market, but they were too expensive. He also thought it was desirable to remember that although street fittings could be designed to give an exceedingly efficient distribution of light such fittings might be unsuitable if they offended the eye of the "man in the street."

Mr. A. C. CRAMB (Croydon) remarked that high-pressure gas was the most formidable rival for outside shop lighting. High-pressure mains were generally laid down the street, with branches carried up outside the shops, so that the whole thing was under the control of the gas company. In the case of a shopkeeper owning arc lamps, he had to maintain these, and found this troublesome, whereas by means of the terms given by the gas company the shopkeeper was relieved of any such trouble. If proper powers were obtained by which electricity supply authorities could take on the maintenance of lamps for outside shop lighting this would be retained, but not otherwise. Proper business organisation and hiring powers were all that were required. It would be possible, in fact, to get £1 for arc lamps above the price for gas with proper organisation. The gas companies merely desired to knock arc lamps out of this class of work, and therefore they did the business at rock-bottom prices.

Councillor CROWTHER (Sheffield) emphasised the importance of municipal authorities being able to undertake wiring work on equal terms with contractors.

Mr. A. J. CRIDGE (Electrical Co.) (communicated) noted that in Mr. Seabrook's opening remarks he had referred to the figure of 2d. per hour as a charge which could be made in respect of supply to arc lamps. He was not aware whether Mr. Seabrook charged by means of a time meter; if he did so, he would not have any trouble, but in Sheffield, where electricity for lighting was 4d. per unit, they had circulated a leaflet saying that the cost of running a flame arc would be 2d. per hour. They metered the energy used, and in the case under review there was an installation consisting of one arc lamp only. The consumer noted the hours of use, and refused to pay more than the equivalent of 2d. per hour for the supply. It was held by the Town Clerk that it was necessary to accept the sum offered, as the leaflet constituted a contract to which the Corporation was bound to adhere. Mr. Haydn Harrison had mentioned combination between the rival illuminating authorities, and Mr. Seabrook had shown them a glimpse of his inmost soul in opposing the suggestion. He (Mr. Cridge) thought they ought to take all straightforward methods of making money, and if reasonable combination was a means to this end, then let them reasonably combine. He wished to emphasise the usefulness of a business-getting department. The value of its missionary work was enormous. He had had charge of one which was evidently respected by Mr. Seabrook, since he had annexed several members of its staff. He would like to lay great stress on the necessity of taking publicity and business-getting seriously, and not playing at it. One frequently saw advertisements requiring men for a few months only—some spasmodic trial being in the air. How on earth could anybody expect to get hold of a good man unless they offered him continuity of employment as one of his prospects? In such circumstances undertakings would only secure a poor specimen, and in consequence would vote publicity no good. He had wondered, from reading the gas papers, whether there really was any distinct idea of business-getting in gas companies. The gas publicity committee was new, and he thought that if they had men in the gas industry who made the serious and well-sustained effort which some of the electric supply undertakings did, the gas people would go forward much more rapidly than they did. He advised electrical men to take in a gas paper and read it carefully week by week, as a means of bringing them to a wholesome state of humility.

Mr. SEABROOK replied very briefly to the discussion, and still maintained that an attitude of frank hostility to the gas competitors was best.

Several other communications were handed in, but we find it impossible to deal with these in the present issue.

Members then adjourned for luncheon. Subsequently they inspected the plant at the Church-street sub-station of the Brighton Corporation Electricity Department and the locomotive shops of the L.B. & S.C. Railway, where an opportunity was afforded, by the courtesy of Mr. D. Earle Marsh, the locomotive superintendent, of inspecting the various shops of the Company, which are all electrically-driven by power supplied from the Corporation mains. A description of some of the interesting plant in these shops was given in our last issue.

The annual dinner was held at the Dome, and, owing to the large number of late applications, two rooms were necessary. Mr. John Christie, President, occupied the chair. This is the first occasion on which ladies have been present at this function, and the novelty had a satisfactory effect on the number attending. After the dinner an informal dance was held at the Grand Hotel, whose management was largely responsible for the success of this part of the programme.

"BEATARK" FITTINGS

The "Beatark" fitting, which we illustrate herewith, was originally designed to meet the wishes and with the assistance of Mr. S. Cameron Gibson for replacing the arc lamps at Nuneaton, and is essentially a fitting for meeting the present tendency of doing without a globe.

It consists primarily of a white enamelled metal reflector with a suitable metal cover. The reflector is designed to reflect the light over a wide area. Provision is made for the suspension of the lamp-holders above the reflector, either by springs or rigidly, so that only the lamp projects through the reflector in such a way that it is "locked" by the reflector, and glare is as far as possible prevented. The fitting is of such a shape that it can be easily adapted to fit on to existing arc lamp cases, where these are available, as was done at Bury. At Barrow it is suspended from the span wires over the roadway and a much more even distribution is thus obtained. A rubber sleeve is supplied to cover the joint between the lamp cap and holder, and in cases where corrosion is likely to take place the lamp caps may be painted or similarly protected and the lampholders copper plated.

GENERAL VIEW OF THE "BEATARK" FITTING.

Although this fitting was designed to eliminate the use of a globe, there are cases where this is considered necessary, and provision is now made for fitting one where desired.

The "Beatark" fitting is being used extensively, not only for street lighting, but for docks, yards, works, &c., both in this country and abroad, a large order having just been executed for India.

PARLIAMENTARY INTELLIGENCE.

PATELEY BRIDGE PROVISONAL ORDER.

On Tuesday a Select Committee of the House of Lords considered the Bill for the confirmation of the Pateley Bridge Provisional Electric Lighting Order. The West Riding of Yorkshire County Council opposed the order, which was granted to Messrs. Christy Bros. & Co., of Chelmsford, and empowered the promoters to lay down mains and works within a prescribed area. The County Council desired to put upon the company the obligation to take up, remove or alter their mains laid in the main roads of the County Council when any alteration, renovation or renewal in the road rendered that necessary.

Mr. VESEY KNOX (for the promoters) pointed out that those onerous obligations by local authorities had the effect of preventing the development in small areas of electrical enterprise, and precluded the people of those localities from having the advantage of electricity. There was no precedent for the insertion of the clause which the County Council desired to have inserted in the provisional order. The Council had ample protection under the general law.

Mr. J. D. FITZGERALD, K.C., for the County Council, said there were 30 cases in the West Riding where the power was granted in respect to gas and water companies, and there was no difference in principle in that case.

Mr. F. CHRISTY, managing director of Christy Bros. & Co., gave evidence, and stated that they hoped by the introduction of cheap electricity to supply power for use in the quarries of the district, and thus to help to revive that industry. If they had heavy additions to their expenses, such as the obligation which the County Council desired to impose, the thing would not be worth doing.

Other evidence was called, and the Committee decided that the Bill should proceed as it stood, and declined to make the amendments asked for by the Council.

TELEPHONE TRANSFER BILL.

In the House of Commons on Tuesday, on the report of the resolution relating to the transfer of the undertaking of the National Telephone Co.,

Mr. CLYNES expressed the hope that the telephone workers would be afforded the opportunity of approaching the authorities, should they so desire, on any important points in dispute between them.

Mr. GULLAND assured Mr. Clynes that the matter should be brought to the notice of the Postmaster-General.

The resolution was passed and the Bill was brought in and read the first time.

The text of the Telephone Transfer Bill was issued on Wednesday.

In a Memorandum accompanying the Bill it is stated that the provisions of the Bill are necessary in order to carry out agreements made with the National Telephone Co., and sanctioned by the House of Commons in 1905, for the transfer to the Post Office, on the close of the current year, of the company's telephone system, and also to provide money for the general extension of the telephone system. Part I. of the Bill provides for the mode in which the amount required for the purchase money payable on the transfer of the company's system, and for the general extension of the telephone system, is to be raised. A portion only of the purchase money is payable in cash, and the required amount of cash will be provided by the Treasury first, by applying for the purpose a sum amounting to about £1,600,000, which is payable to the Post Office by the company in respect of subscriptions received in advance by the company for telephone services; and as to the balance, by borrowing by means of terminable annuities, which must be repaid within 20 years at the latest. The amount of the purchase money which is not payable in cash is to be provided for by the Treasury by handing over securities to the company, the securities to be terminable annuities, calculated so as to repay the amount owing in 20 years at the latest, or, if the company agree, Exchequer bonds, which must be paid off within a similar period. Part II. of the Bill contains provisions as respects the pension rights, &c., of employés of the company who are taken into the service of the Crown. These provisions will be explained in a Parliamentary Paper which will be issued dealing generally with the position of these transferred employés.

RAILWAY LAW.

A useful Bill of 201 clauses, for the consolidation and amendment of the law relating to railway traffic has been introduced and read a first time in the House of Lords. Among the proposed amendments in the law is one to limit a railway company's liability for accidents to £2,500, £1,000 and £500 for a first, second and third class passenger respectively, half these sums being the limit in the case of persons carried at half fares, whilst £100 is to be the maximum for a child conveyed free. The Bill also provides that all by-laws, notices and conditions as to the acceptance and conveyance of traffic, &c., shall be legal and valid when sanctioned by the Board of Trade. The Board is also to be given an extension of its

Digitized by Google

conciliatory powers, whilst the establishment by the railway companies of advisory committees to deal with local complaints is proposed. Maximum charges for passenger traffic are provided, and the existing law relating to "reasonable facilities," through rates, undue preference and rate increases is re-enacted and amended. In regard to arrangements for the working of traffic between two or more companies it is proposed to divide agreements into two classes, the sanction of the Board of Trade being sufficient in one class, whilst appeal to the Railway and Canal Commissioners or to Parliament is only to be necessary in cases of very great importance.

Greater London Railway Bill.—In the report of Sir J. Compton Rickett, Chairman of the Select Committee of the House of Commons which considered this Bill, it is pointed out that the length of the proposed railway is now reduced to 32½ miles. The Committee had gone through the Bill and had amended the title to a bill for incorporating the Greater London Railway Co. and to authorise them to make and maintain a railway from Northolt to the Victoria and Albert Docks and for other purposes.

LEGAL INTELLIGENCE.

National Telephone Co. v. Postmaster-General.

On Wednesday the Court of Appeal (the Master of the Rolls and Lords Justices Farwell and Kennedy) delivered their reserved judgment upon the cross appeals of the parties from the judgment of the Railway and Canal Commissioners in regard to the construction to be put upon certain clauses of the purchase agreement (under which the Postmaster-General takes over the company's system at Dec. 31 next) and as to the validity of notices to the company by the Postmaster-General that certain land, plant and buildings were unsuitable for the Post Office service. The company applied to the Commissioners for a declaration that the notices which referred to three exchanges in the Metropolitan area and 18 in other areas, were bad on the grounds of generality and vagueness. On behalf of the Postmaster-General it was contended that the phraseology of the agreement entitled him to reject land, plant and buildings and equipment as "unsuitable for the actual requirements of the telephonic service of the Post Office," in areas where already sufficient plant, &c. The Commissioners by a majority held that the notices in regard to the three exchanges in London were good, but the others were bad as being too vague.

The MASTER OF THE ROLLS in giving judgment said: This appeal depends upon the true construction of what is known as the purchase agreement of 1905. At the date of the agreement the Postmaster-General had granted licences to the National Telephone Co. which, or most of which, would expire at the end of 1911, and the company was carrying on a large and lucrative business. The Postmaster-General was also carrying on a large and increasing business of the same nature and in some places in direct competition with the company. They were rival exchanges. The policy of the Government was to get the whole telephone monopoly in the hands of the Post Office at the expiration of the licences and in the meantime to secure for the public certain advantages. Speaking in general terms, the effect of the agreement was that on, or as from, 31 Dec., 1911, the company was to cease to transact any telephonic business within the monopoly, and the P.M.-G. was to purchase, subject to certain exceptions, all the property of the company on or as at that same date. Now the Railway and Canal Commissioners were to settle any differences as to the exceptions and also the value as on Dec. 31, 1911, of everything purchased and not within the exceptions. The subject matter of the purchase is stated in clause 2. It comprised (1) all plant, land and buildings of the company brought into use with the sanction of the P.M.-G. and in use on Dec. 31, 1911, for the purposes of the licensed telephone business of the company; (2) any private wire business of the company with all plant, land and buildings in use by the company on Dec. 31, 1911, for the purposes of such business; (3) all stores and furniture in use on Dec. 31, 1911 and reasonably necessary for the purposes of the telephonic business of the company; and (4) spare plant reasonably necessary. Sub.-sec. 3 of clause 2 is important. "Plant, land and buildings shall be deemed to have been brought into use with the sanction of the P.M.-G., if such plant, land and buildings comply with one of the following conditions but not otherwise (that is to say): (*a*) if such plant, land or buildings are in use for the purposes of the company's business at the date hereof; or (*b*) in case of plant, if such plant is after the date of this agreement constructed by the company in accordance with the specification and rules set forth in the third schedule hereto; or (*c*) in the case of land and buildings, if such land and buildings are, after the date of this agreement, acquired or constructed with the consent in writing of the P.M.-G." Then there is a further provision which I need not *read* now. It will be observed that all plant, land and buildings in use at the date of the agreement of 1905 are to be purchased on Dec. 31, 1911. But plant subsequently acquired by the company is only to be purchased if it is constructed in accordance with a scheduled specification, and land and buildings subsequently acquired are only to be purchased if acquired or constructed with the consent in writing of the P.M.-G. Thus far there is no great difficulty, but it was part of the arrangements that the P.M.-G. should have the right to object to buy certain property which would otherwise fall within the terms of clause 2, provided he gave notice 12 months beforehand, and the Commissioners were six months beforehand to award where the objection were capable of being maintained. The Commissioners were also on or as on Dec. 31 to ascertain the value of the purchased property in case of difference. This part of the arrangement is found in a clause which it is necessary to read carefully. Clause 3, sub.-sec. 4, is as follows: "In the case of (*a*) plant not constructed in accordance with the specification and rules set forth in the third schedule and (*b*) plant of any kind, land and buildings, in use on Jan. 1, 1911, for the purposes of the company's licensed telephonic business in competitive areas." The P.M.-G. may, by notice in writing given to the company not later than Jan. 1, 1911, object to buy such plant, land or buildings as he considers will be unsuitable for the actual requirements of the telephonic service of the Post Office on Dec. 31, 1911. Now it will be observed that the right of objection to plant on the grounds of construction under (*a*) is without limit of locality, whereas the right to object to plant, land and buildings under (*b*) is limited to competitive exchange areas, a phrase defined in clause 1. I think it is plain that, although (*a*) is wide enough to include competitive as well as non-competitive areas, in practice it must be confined to non-competitive areas. It is also plain that the words "plant of any kind" in (*b*) comprises all plant mentioned in (*a*) including the scheduled list plant. The battle in this Court has raged around the word "unsuitable." I agree that the primary meaning of unsuitable apart from the context is unsuitable in nature or quality. But that word does not stand alone, nor is it, in my opinion, the most important word in the sentence. It is not the same thing as unsuitable for use in the telephonic service by reason of its character or nature. The word "actual" confines the gift of prophesy to what will happen on Dec. 31, 1911, and forbids speculation as to what may happen at a more remote date. In my opinion the meaning of the clause is reasonably clear. It deals with the case of a competitive exchange area where the Post Office has already or probably will have a service in full operation. If the Post Office has in that area adequate provision for the needs both of the company's subscribers in that area and of its own subscribers in that area the P.M.-G. is entitled to say 12 months beforehand "I shall not want this on Dec. 31; all the requirements of my service will be satisfied without this, it is not suitable for my requirements." The circumstance that (*b*) is not confined to plant but extends to land and buildings seems to me to strengthen the argument that the expression ought not to be narrowed so as to apply solely to nature or character. There are other indications in the agreement which confirm my view. I refer especially to sub-sec. (*b*) of clause 3. That sub-section deals with plant constructed during 1911 and with buildings constructed or acquired during 1911, and such plant must be in accordance with the specification or there would be no objection to purchase under sec. 2 and by it a right to object to three months after Dec. 31 is given. And the question for the Commissioners is to be "suitability of the plant for the actual requirements of the telephonic service of the Post Office on Dec. 31, 1911. It seems to me that these words cannot be limited to nature and character for, ex concessu, the plant is free from objection on that score. It is not easy to understand why (*b*) is limited to competitive exchange areas on any other view. In such cases there would obviously be a danger of duplication and superfluous plant and buildings—a danger which would not exist to the same extent in non-competitive exchange areas. I have not overlooked the fact that (*b*) does not apply to all places in which competition exists but is limited to 15 named competitive exchange areas. These were the most important areas and the parties were content to deal with them separately and apart from the rest of the country. With great respect to Mr. Justice A. T. Lawrence with whom Mr. Cathorne Hardy concurred I think he gave too narrow construction a to the words "unsuitable for the actual requirements of the telephonic service of the Post Office on Dec. 31, 1911." And I agree with the opinion of Sir Jas. Woodhouse on this point. The next question for our decision arises upon sub-sec. 2 of sec. 3. The scheme of the clause is that the P.M.-G. is to give notice in writing of his objection before 1911. If the notice is not acquiesced in by the company, the company must obtain an award from the Commissioners before June 30, 1911, that the property specified in the notice is suitable for the actual requirements of the telephonic service, otherwise the objection is to be deemed valid. Now as the notice of objection may be given in 1910, 13 months before the subject-matter of the purchase can be ascertained, it seems to me impossible to contend that the notice must specify every detail. It must be sufficient to indicate in general terms the nature of the property to which objection is taken. For example all plant falling under a particular description, attempting to give particulars of the place in which such plant will be found or the quantity of such plant, it will be for the company to apply to the Commissioners for an award that the objection is wholly bad or partially bad. Sir Algernon Cripps put forward as an example a cable containing several hundred wires some of which only are used for licensed telephonic business. The company may contend that such a cable is in use for the purposes of the private wire business and that the P.M.-G. is bound to purchase it because the wires cannot practically be severed. The Commissioners will decide one way or the other, for the cable will either be excluded from the purchase or not according to their decisions. Of course, I express no opinion on this point. The decision thus given will govern all similar cases. I think there will be no difficulty in applying the principle to the very numerous items in existence on Dec. 31, 1911. I feel no doubt that a general notice such as I have indicated is perfectly good. It is not made bad because it may include items which cannot be properly objected to. In my opinion all the notices are good in this sense, namely, that unless the company obtains an award in their favour, either wholly or in part, the property falling on Dec. 31, 1911, within the category objected to will be excluded from purchase. The opinion of the P.M.-G. expressed in the notice is prima facie decisive and the burden is thrown upon the company as challenging that opinion. It is obvious that questions of difficulty must arise. But I feel confident that the decision by the Commissioners

Digitized by Google

of a comparatively small number of typical or test cases will dispose of these questions, and that, with few exceptions, the highly competent experts on both sides will agree details without appealing to the Commissioners in their character as valuers under clause 4 of the agreement after Dec. 31, 1911. With great respect to the learned Judge, I am unable to agree with his view as to the invalidity of the major part of the notices. His Lordship added that in his opinion the declaration contained in the order of May 29, 1911, should be discharged and the following order substituted: Declare that the words "unsuitable for the actual requirements of the telephonic service of the Post Office" in the purchase agreement do not relate solely to the nature or character of the plant, land or buildings. Declare that the fact that plant, land or buildings will not be actually required for the telephonic service of the Post Office on Dec. 31, 1911, owing to possession by the P.M.-G. on the said date of either plant or buildings adequate and suitable for the actual requirements of the telephonic service of the Post Office on that date is a valid ground for objection by the P.M.-G. within the meaning of the purchase agreement. Declare that the above declarations are applicable only to competitive exchange areas as defined in clause 1 of the purchase agreement. Declare that all the notices of objection given by the P.M.-G. were valid and sufficient.

The Lords Justices delivered judgments to the same effect and the appeal of the P.M.-G. was therefore allowed with costs and the cross-appeal of the company dismissed with costs.

W. Canning & Co. v. Northern Metallic Flexible Tube Co.

The hearing of this action was continued before the Official Referee (Mr. Muir Mackenzie) on Monday.

Mr. Geo. A. Darby, recalled, said there was a froth on the galvanising tank when he examined the plant at Bradford. Bubbles of gas were quite usual on the surface of an electrical apparatus of that kind. They were the result of the electrical action.

In cross-examination, Witness admitted that during the whole time the pickle vat was at work the iron bar in it and the bottom of the vat were being subjected to the action of the hydrochloric acid. With regard to the condition in which the steel tape left the swill boxes, he tested it by putting his fingers on the tape and then licking the former. Had there been any acid or alkali upon the tape he would certainly have tasted it.

Mr. Wm. E. Hughes was also recalled and gave further evidence in support of plaintiffs' case.

Mr. Waugh, K.C., opened the defence, and said that plaintiffs had not made a machine of that nature before but they had had every inducement to obtain the best results from the plant if it were capable of giving such results. Defendants agreed to purchase a plant which would do its work, and not an experimental machine. Plaintiffs' plant did not fulfil that expectation and he submitted that the evidence had already shown that the machine would not do its work efficiently. From the points of view of scientists and practical men the plant was an absolute failure.

Mr. Albert Crowther (trading under the name of defendant company) said that it was necessary to galvanise the steel strips used in that trade in order to prevent rust. He decided to do the galvanising on his own premises and approached plaintiffs with a view of having a galvanising plant installed. Plaintiffs inspected his premises and said that they could handle large enough, but they thought they might just fit the plant in. Certain alterations were made and plaintiffs expressed themselves satisfied with the size of the premises for the plant. A contract for £230 for a plant was submitted. The machinery was put down but he never succeeded in producing saleable strip from it. Plaintiffs tried to do so themselves but failed also and eventually took it away, after an arrangement that the dynamo installed should be retained but the rest of the plant removed. Plaintiffs asked £350 for the second plant, but defendant refused to pay that sum because he said the failure of the first plant had caused him considerable loss. Eventually, it was agreed that the price should be fixed at £260. After its erection the plant did not run properly and defendant suggested improvements. The strip from the pickling bath was too dark and it had other defects. Eventually, he wrote to plaintiffs stating that the plant would never be a success until the iron pickling vats were replaced by slate vats and other alterations made. Not obtaining satisfaction he refused to pay the balance of the contract price and the present action was commenced. During the four days Mr. Darby was testing the plant he produced about one reel of galvanised strip in short pieces. The full load of the plant was six reels and Mr. Darby started with this number, but they were constantly breaking owing to the bad running of the machine. Since he had had complaints about defective strip, owing to the inefficiency of the machine, he had lost orders, many of his customers having ceased to deal with him altogether.

In cross-examination, Witness admitted that he had only taken up the galvanising branch of his business during the last four years and did not profess to be thoroughly competent at it. He knew nothing about electric currents, &c., when the plant was installed. The machine was held out as being a very simple one to look after and one which anyone following the instructions given could have managed. He admitted that, although the passage of the strip through the hot sawdust bath failed to dry it as it should have done, he never complained to plaintiffs about it, nor did he complain that the gas burners under the sawdust bath were not efficient. He denied that he worked the machine with damp sawdust. The machine ran with a varying speed instead of an even drive with the result that at the time the strip passed through the sawdust so quickly that it was not properly dried. **The bad colour of the strip was not due to inefficient drying of the sawdust bath but to the fact that the sawdust was not properly cleansed from the strip. The swill boxes failed to act efficiently.**

Hartlepool Electric Tramways (Ltd.) v. Hartlepool Corporation.

On Wednesday last week Mr. Justice Bray delivered his reserved judgment in this case.

After reviewing the facts (which were given in The Electrician for June 16), his Lordship held that Messrs. Sellon and Ashby were the owners of the tramway undertaking and it was only they who could be required to sell to the Corporation. They had exercised the option of purchase although it was suggested that the Corporation were ignorant of the actual position. He was satisfied that they knew the position and that it was not until some time when they were before the Arbitrator that they raised the present contentions. In his Lordship's opinion the tramway material, plant, &c., belonged to the promoters (Messrs. Sellon and Ashby) and were being used by them for the purpose of the undertaking within the meaning of sec. 43 of their Act. The sale did not affect them because there was no approval by Board of Trade, and the undertaking remained in the promoters. The fact that the tramway was constructed by plaintiffs and not by the promoters did not affect the question, and the tramway never became the property of the Company. The latter might be under some obligation to transfer it to the Company but the Corporation would not be affected by that. He also thought that the tramway was being used by the promoters within the meaning of sec. 43 and that it was used by the Company as the servants or agents of the promoters. The real contention was that the Corporation were entitled to have the undertaking transferred to them, but they were to have all that for nothing. With that contention he could not agree. The Corporation were both entitled to purchase the undertaking on the terms mentioned in the agreed particulars of claim for £12,963. He gave plaintiffs leave to make any amendments which would entitle them to the relief he had mentioned. The order would be in the form of a declaration that the Corporation were entitled and bound to purchase the undertaking upon paying £12,963 to the promoters and that plaintiffs must undertake to execute any assignment or transfer, and that plaintiff Company should join in such transfer if required by the Corporation. Costs would follow the event.

Tube Railways and Land Tax.

On Monday the Court of Appeal (the Master of the Rolls and Lords Justices Farwell and Kennedy) commenced the hearing of the appeal in the case of the Central London Railway Co. v. Commissioners for Land Tax of the City of London from a decision of Mr. Justice Swinfen Eady, which raised the question as to plaintiffs' liability for land tax where the line lay under highways and the tax had been redeemed on lands abutting on those highways, and, further, where the line was under any land the surface of which had been exonerated from the tax by redemption.

In the Court below it was held that plaintiffs were not liable to pay land tax in respect of so much of the railway and works as was situated under any lands which had been exonerated from tax prior to the construction of the railway, but that they were liable to pay the tax in respect of so much of the railway and works as were situated under any lands not so exonerated, and that where the tax had been redeemed in respect of lands or houses abutting on the public street or highway the exoneration did not extend to the middle line of the street or highway.

At the conclusion of the arguments their Lordships reserved judgment

Tramway Rating.

Last week a Divisional Court (the Lord Chief Justice and Justices Darling and Bankes) heard an appeal of the Metropolitan Electric Tramways (Ltd.) as to the rating of their lines in Tottenham.

Mr. Danckwerts, K.C., appeared for the Company, and Mr. Ryde, K.C., for Tottenham Council.

Mr. Danckwerts said the question was whether or not a tramway was entitled to an exemption under sec. 211 of the Public Health Act, 1875, as being assessed at one-fourth only because it came within the definition of a railway. The magistrate before whom the question was raised, and who decided against the Company, held that he was bound by a decision of the High Court. The Court had also held that a tramway was entitled to that exemption, but as the later judgment had not over-ruled the decision on which the magistrate depended, a difficulty had arisen and there would be an appeal in any case, no matter what the decision of the Divisional Court was.

Mr. Ryde said that was true, and the Lord Chief Justice said that in those circumstances the Court would decide against Mr. Danckwerts, and dismissed the appeal.

STRIP LIGHTING AT HOVE.

In connection with the general scheme of illumination of the entire width of the Brighton & Hove front, we understand that the British Westinghouse Co. supplied the strip for the lighting of the Hove front to the Hove Corporation Electricity Department. This strip is of the company's standard manufacture, 7/22 twin cable insulated with pure and vulcanised india-rubber, taped and braided flat, and well compounded. B.C. holders with aluminium casings were employed, each holder being supplied with two small lugs for fixing purposes. This form of clip dispenses with the costly and cumbersome saddles frequently employed. The distance between the holders was 24 in., and Westinghouse carbon lamps were used in them. The whole of this material is of English manufacture throughout.

COMMERCIAL AND INDUSTRIAL SECTION.

MUNICIPAL, FOREIGN & GENERAL NOTES.

BRITISH NOTES.

Aberdeen.—The proposed extension of the tramways to Footdee has been reported upon by the manager (Mr. R. S. Pilcher), but the Tramways Committee have postponed consideration of the matter until a report has been obtained on the rail-less trolley system at Leeds and Bradford.

The committee have decided to give free passes over the whole system to blind persons.

Aldershot.—An inquiry was held here on Wednesday by Mr. T. C. Ekin into the application of the Council for sanction to borrow £2,500 for additional plant, &c., for the electricity undertaking.

Bispham with Norbreck.—An inquiry was held last week into the Council's application for sanction to borrow £9,180 for electricity works.

Mr. R. H. S. Butterworth, who appeared for the Council, supplied the usual statistics of ratable value, &c.

The consulting engineer (Mr. J. W. Speight) supplied technical details of the scheme. In his opinion, the undertaking could be worked without becoming a charge on the rates, and its success was assured from the commencement.

Chester.—The borough electrical engineer (Mr. S. E. Britton) has prepared a scheme for utilising the water power of the Old Dee Mills in generating electrical energy.

The Lighting Committee recommended the Council to authorise them to engage an expert to report on the scheme, and in the event of such report being favourable to apply to the Local Government Board for sanction to borrow £5,000 towards the cost of executing the works, which it is proposed to meet as follows:—Appropriation from uninvested reserve fund, £5,000, loan £5,000, total £10,000.

The Improvement Committee were not, however, favourable to the scheme, but the Council passed the Lighting Committees's report on Wednesday with some slight amendment.

Coronation Telegrams.—847,000 additional words were telegraphed from London to the Provinces and foreign countries on Coronation Day, and 370,000 words on the following day, on the day of the Royal Progress. The average total for ordinary Thursdays and Fridays is 150,000 to 200,000. Between 50,000 and 60,000 words were despatched from Westminster Abbey by means of chutes and pneumatic tubes. This represents a much larger number of messages than has ever been handled before by the telegraph.

Coronation Traffic on Electric Railways.—The following numbers of passengers were carried on electric railways in London on June 22 and 23:—

Baker Street & Waterloo, 480,000; Charing Cross, Euston & Hampstead, 500,000; Gt. Northern, Piccadilly & Brompton, 520,000; Central London, 450,000; Metropolitan, 1,000,000; Metropolitan District, 1,400,000.

Dawlish.—The Dawlish Electric Light & Power Co. commenced the supply of electricity on the 20th inst. The plant includes a Crompton dynamo and Garrett steam engine and a storage battery. The contractors were Crompton & Co.

Ealing.—The L. G. Board have sanctioned loans of £7,000 for mains £6,000 for services, £5,000 for meters and £500 for transformers.

Electric Pumping of Sewage.—The L.G. Board have approved a scheme of main sewerage and sewage disposal for the parish of Owston and Skellow, in Doncaster rural district.

There are several miles of main sewers to be constructed with c.i. pipes, which will gravitate to an underground storage tank, from which the sewage will be electrically pumped to the disposal works, where it will be treated in open tanks, followed by filtration through percolating filters, before being discharged into the adjacent watercourse. The engineers for the work are Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne.

Elland (Yorks.)—The Council offer to supply electricity in bulk to Greetland Council provided the latter agree to take a minimum quantity so as to cover interest and sinking fund on the capital expenditure involved.

Farnham.—The Public Works Committee have been authorised to obtain expert advice upon an offer of the Farnham Gas & Electricity Co. for the supply of electricity for pumping.

Fleetwood.—The Council have approved the following revised charges for electricity supply to private consumers:—

First 500 units 4½d. second 500 3½d. remainder 3d. per unit. For quarterly consumption above 2,000 units a flat rate of 3d. per unit; prepayment meters up to 5 amperes for lighting 5d. per unit, but no rental charged for meter; cinematograph machines 3½d. per unit if supplied off 200-volts circuit, but by motor generators off 400-volt circuit at power rate.

Hammersmith (London).—Mains are to be extended at a cost of £868 to supply current to Messrs. Clark's Lead Mills.

Herne Bay.—The Council have opened negotiations with the local gas Co. with a view to transferring their provisional electric lighting order to the company.

Industries in the Edinburgh District.—A public meeting was recently convened by the Lord Provost of Edinburgh, the Provost of Leith and the Convener of the County for the purpose of considering the steps to be taken to advance the interests of Edinburgh, Leith and Mid-Lothian as an industrial and commercial interest.

In the course of the discussion members emphasised the necessity for cheap land, cheap labour and cheap and good transit facilities in industrial development.

Ex-Bailie MACKENZIE (Edinburgh) said it seemed to him that the Corporation of Edinburgh should take the first step. They had a good deal of land in their hands for which they were getting little. If they offered cheap land with remission of taxation for a number of years, and offered cheap power, instead of taking from £40,000 to £50,000 of the surplus from the electric lighting undertaking and frittering it away in small reductions of a fraction of a penny on the rates, he thought they would achieve something. A charge of 1d. per unit was not cheap power. He would say that from March to October a cheap rate would be ½d. per unit. The Corporation had nearly £1,000,000 worth of plant standing there doing nothing, and it would be far better to encourage industries by offering electric power at ½d. per unit than by continuing the present rate (Applause).

Councillor CAMERON (Edinburgh) suggested that the city should endeavour to expand towards the sea. Granton was standing there a mud bank. There were Granton Docks—they could get them on a paying basis and develop the shipping west of the docks, and then they would have a commercial community again.

Ultimately it was remitted to Lord Provost Brown, to Provost Smith and to Col. Trotter to select a committee for inquiring into the question which had been raised, and to summon another general meeting.

Light Railway Orders.—During May 11 applications were lodged with the Light Railway Commissioners for light railway orders, but there were only three new schemes, the remainder being for extensions of time or amendment of powers. The new schemes were: Birmingham Corporation (Sharpe & Co., Agents); Great Northern Kirkstead and Little Steeping (G.N Rly. Co., R. Hill Dawe, Agent); Burry Port & Gwendreath Valley Railway (Seaton, Taylor & Co.)

Linlithgow.—The County Council have applied for sanction to a loan of £2,000 for additional generating plant to supply electricity in the Broxburn lighting district.

Llandudno.—The lighting of the promenade is to be improved by the erection of additional electric lamp columns—one between each of the present columns, each lantern to have four or five metallised filament lamps of 40 c.p. each.

L.C.C. Tramways.—The new electric tramway from Battersea Park-road, over Battersea Bridge to Beaufort-street, Chelsea, was opened for traffic on Coronation Day. The Council's cars now run over five of the Thames bridges.

National Electrical Manufacturers' Association.—The Council of this association have elected Mr. F. H. Nalder chairman in succession to Mr. H. W. Butler, who has for a time severed his connection with the electrical manufacturing industry.

A meeting of the Council will be held at the Institution of Electrical Engineers on July 5 at noon and a special general meeting on the same day at 3 p.m.

Olympia Electrical Exhibition.—Stepney (London) Electricity Committee report having considered a communication from the hon. sec. of the Associated Municipal and Electrical Engineers (Greater London) intimating that the Joint Publicity Committee have under consideration the question of providing an information bureau at the Olympia Electrical Exhibition, and that the London Electric Supply companies had made themselves responsible for a suitable stand, involving an expenditure of £1,000.

Of the cost of the exhibit the companies were contributing one-half, and it was considered that local authorities owning electricity undertakings should contribute the remaining £500, on the basis of the size of their undertakings by contributions varying from £10 to £30.

The Committee recommend the Council to contribute their share (£10) out of the funds of the electricity undertaking.

Digitized by Google

Redditch.—Mr. W. A. Jackson of West Bromwich was recently called in to report upon the proposals of the resident engineer (Mr. W. J. Ferguson) to reorganise and extend the plant at the electricity works.

Mr. Jackson has now presented his report, which deals with the management of the present works as well as the proposed extension. Mr. Jackson considers the works are being managed in an efficient manner, and if allowance be made for the system adopted and the plant at the disposal of the engineer he considers the costs for the past year will withstand criticism. He could support with confidence the scheme of extensions submitted; it had been prepared in a sound, engineering manner, and he recommended its adoption by the Council. He considered that, with a complete year's working of the turbine plant and an increase in the power output at the average rate, the undertaking should become self-supporting.

School Lighting.—The Royal Victoria and Grosvenor Schools, Tunbridge Wells, are to be wired by the Council.

Shoreditch (London.)—On the recommendation of the Lighting Committee the Council have extended for two years from April 1, 1912, their agreement with the Great Northern & City Rly. Co. for the supply by the company to the Council of electricity in bulk, but the minimum payment in the second and third years is to be £600 and £800 respectively.

The Committee have received a report from the borough electrical engineer (Mr. C. Newton Russell) pointing out that the continued increase in the number of consumers necessitates a further supply of meters and indicators, and the necessary instruments are to be purchased at a cost of £260.

Walthamstow.—The L. G. Board have sanctioned a loan of £9,206 for additional electrical plant, and application is to be made for sanction to borrow £1,485 for a feeder cable.

West Ham.—Tenders are to be invited for water-tube boilers, coal-handling plant, turbo-alternator, river service pipework, &c., and also for buildings and converter for the Stratford sub-station.

With reference to the fixed price lighting scheme previously before the Electricity Committee, the electrical engineer (Mr. H. H. Couzens) has reported that the prospective customers were unable to further postpone the matter. While it would be desirable to keep the whole of the business in the hands of the Corporation, he did not anticipate that the Council could, at present at any rate, secure a loan from the L. G. Board on such terms as would enable them to put forward a scheme attractive to consumers and on sound business lines. The Committee decided not to entertain the idea of the supply of current through the intermediary company, but it should be referred to the Town Clerk and the electrical engineer to consider the desirability of including a clause in the next Bill to obtain powers.

Mr. Couzens has been authorised to negotiate for portion of a stand at the Olympia Electrical Exhibition at a cost not exceeding £30 and to purchase admission tickets up to an amount of £10 for distribution to existing and proposed customers.

Westminster.—The City Council have been taking energy from the Charing Cross, the St. James's and Pall Mall and the Metropolitan Cos. at 2¼d. per unit for light and 2d. for power, and as the Contracts Committee have been informed that the Council obtain energy for power from another company at 1d. per unit, inquiries were made of the three first-mentioned companies whether they would be prepared to make a reduction.

The Charing Cross and Metropolitan Cos. were unable to do so, but the St. James's Co. agreed to 1d. per unit for power, with a fixed charge of 7s. 6d. per rated horse-power per quarter. The contracts with two of the companies have been renewed for 12 months from June 24 on same terms as before, and with the St. James's Co. on the terms of the reduced charge.

Wood Green.—The electric light scheme prepared by Mr. G. W. Spencer Hawes and estimated to cost £21,000, has been again discussed by the Council.

The proposal was to obtain a bulk supply from the North Metropolitan Electrical Power Supply Co., the Council undertaking the distribution work. It was reported that circulars had been sent to occupiers of premises in streets in which it was proposed to lay distributing mains, but only 110 were in favour of taking current at present, in future 190; 88 doubtful, and against 337; 867 postcards were not returned. Ultimately, a resolution disapproving of the scheme was carried. It was stated that the Council had spent £1,200 in connection with electric lighting and that there ought to be some return. A suggestion was made that the Council should approach the Power Co. with the object of obtaining a quid pro quo, but nothing was done, as it was felt that it was a matter for the Committee.

Worcester.—An inquiry was held here last week into the Council's application for sanction to borrow £3,375 for the electricity undertaking.

The Chairman of the Electricity Committee (Councillor R. Clarke) said that at present the undertaking was working under a disadvantage, as they were supplying both alternating and continuous current. As a result of negotiations for a large amount of current for power, it was decided by the Committee to change over to the polyphase system. The cost of the necessary plant for supply of current and also the change over to the polyphase system would amount to £7,100, £3,375 of which they were asking for under a loan and the balance was to be raised by revenue, excepting the cost of the cable, which would be paid for out of the cable loan.

The city electrical engineer (Mr. C. M. Shaw) said the loan would enable the Council to supply power as well as light over the whole city. They could not supply power under the present alternating system because of the difficulty of starting the motors, and the very bad power factor which resulted from the single-phase system. During the past few years many applications had been received for power, but they had had to be refused owing to the fact that they could not extend the single phase for such a distance. Under the present system they could never expect to supply the outlying districts. From one firm alone they had an application for power to the extent of £700 per annum, but that, with innumerable smaller amounts, had to be refused, the total power refused during the past few years being over 400 H.P. At present both the alternating and continuous systems had to be run, and spare current had to be kept for each. By the polyphase system these would be combined, resulting in a net gain of 800 H.P.

There was an outstanding debt of £400 on some of the present machinery, and the inspector (Mr. T. C. Ekin) said that that would have to be deducted from any loan, and the Town Clerk, therefore, formally applied for an increase of £400 upon the loan.

In answer to the Inspector, Mr. Clarke said that the agreement with Messrs. Heenan & Froude had not yet been signed, but he hoped it would be during the next week.

Workhouse Lighting.—The Visiting Committee of Chester-le-Street Guardians have decided to obtain tenders (from local firms) for wiring the workhouse; electric current being supplied by the County of Durham Electrical Power Distribution Co.

Guildford Guardians have instructed Mr. Lankaster Burne to report upon the proposal to adopt electric lighting at the workhouse.

York.—The Tramways Committee recommend an extension of the tramways to South Bank at a cost of £17,000, and also to Heworth, a northern suburb, at a cost of £25,000 or £30,000.

Outing.—The Linolite Company's annual outing was held at Chertsey on Saturday. The party consisted of the works and office staffs. Mr. Ackermann (engineer and manager), Mr. R. L. Matthews (assistant manager), and Mrs. Ackermann were also present. Luncheon and tea were served at St. Anne's-hill by permission of Sir A. K. Rollit, and after tea the party drove back to London.

COLONIAL AND FOREIGN NOTES.

Argentina.—The first section of the electrified tramways of the Nacional Tramway Co., in La Plata, has been opened.

Sr. Jose Pedriali, manager of the Anglo-Argentine Tramways Co., states that the construction of the "tube" from Once to Plaza Mayo will be commenced on Sept. 15. The material has been ordered.

The Cia Alemana Transatlantica de Electricidad has acquired the electric cable undertaking of the Dolores Electric Light Co. for $340,000.

The first report of the Cia General de Electricidad de Cordoba (from March 9, 1909, to Dec. 31, 1910) states that the hydraulic power house of the Cia Argentina de Carburo de Calcio, including the dam of the Usina Molet, has been purchased for $600,000 (paper), half shares and half cash. This station has a capacity of 1,400 H.P., and with few modifications can be made to supply current to the city of Cordoba. Work has also been commenced on the equipment of a steam power house in Cordoba, the laying of mains, &c., and consumers are being connected. The capital is $1,500,000 (gold), of which $860,650 has been subscribed and $756,220 paid up, besides $270,000 7 per cent. bonds. The machinery was supplied by the Cia Industrial de Electricidad.

Australasia.—Eaglehawk (Victoria) Council have received tenders for the equipment of electricity works, and before deciding upon them councillors will visit Sunbury, Korumburra and Melbourne.

The Melbourne G.P.O. has been re-wired, and about 1,200 metal filament lamps have been installed in place of the arc lamps hitherto used in the mail room, under the superintendence of Mr. T. Hill, of the works branch of the Department of Home Affairs. The clock in the tower is now lighted by 112 16 c.p. metal filament lamps.

Tenterfield (N.S.W.) Council are about to appoint a Committee to consider the question of public lighting.

The Electric Energy Supply Co. (Brisbane) has applied for authority to supply electrical energy in Warwick (Queensland).

Cottesloe (W. Australia) Electric Lighting, Gas & Power Co. recently installed new plant at their power house, including a 150 H.P. Babcock & Wilcox boiler, a 120 H.P. steam engine and a 90 kw. dynamo giving current at 500 volts. The plant was installed by Messrs. Splatt, Wall & Co. (Perth).

Electric Railway across Pyrenees.—The new electric railway between Mont Louis (France) and Puigcerda (Spain), the highest point of which is 5,420 ft., was opened for traffic on Wednesday.

Exhibitions.—An international marine motor exhibition will be held at Copenhagen in July and August, 1912. The exhibits will include motor driven winches, &c. The Commissioner for Great Britain is Capt. A. Solling, 61, Heathland-road, Stoke Newington, London, N.

Applications for space at the international automobile exhibition

Digitized by Google

to be held at Berlin from Oct. 12 to Oct. 22 next have to be sent to the Sekreträder Internationalen Automobil-Ausstellung, 16, Leipzigerplatz, Berlin, W.9, by to-day (June 30), but applications received later may be satisfied if space is available and possibly at an increased charge.

An International Municipal Congress and exhibition will be held at Chicago from Sept. 18 to 30 next. At the same time a Good Roads Congress will be held at Chicago.

The Government of Panama have voted £20,500 towards a fund for a universal exhibition at Panama to celebrate the opening of the Panama Canal.

ELECTRICITY SUPPLY AND TRAMWAY ACCOUNTS.

Blackburn.—The accounts of the electricity department show capital expenditure of £279,484 on March 31, an increase of £5,090 during the past year.

The nett revenue from sale of current was £35,017, motor and lamp rental £1,607, and receipts from sale of lamps and fittings were £1,748, a total of £38,372, against £36,716. The total expenditure was £19,324, against £17,142, leaving a gross profit of £19,049, against £19,574. Interest required £6,765, income tax £403, instalments of loans and sinking fund £10,536, and depreciation £1,000, leaving £697 to be transferred to reserve, against £1,388. 4,836,276 units were generated, against 4,535,680, and 4,596,702 sold (2,367,281 to private consumers, 1,885,014 for traction and 344,407 for public lighting), against 4,308,005. There are 208 arc and 478 incandescent lamps for street lighting, against 209 arcs and 470 incandescents in 1910, and the maximum supply demanded was 3,200 kw., against 3,000 kw.

In the report of the borough electrical engineer (Mr. P. P. Wheelwright), it is stated that the results have been adversely affected by trade depression, and especially in the building trade, but the rate of connecting new consumers has been maintained. Although the number of units generated increased by over 100,000 the expenditure on fuel was nearly £100 less, but repairs and maintenance of plant and buildings showed an increase. The units sold for power showed an increase of nearly 34 per cent., and the effect of the metal filament lamp on the units sold for lighting had been exhausted. The motor hiring department increased the horse-power of motors connected by 120, bringing up the total brake-horse-power maintained by the department to 1,400, while the total brake-horse-power owned by consumers aggregate 1,600. The total connections for motors, heating and lighting are equivalent to 209,640 30-watt lamps, an increase of 7 per cent.

Bradford.—The accounts of the electricity supply department for the year ended March 31 last shows a net profit of £8,980, an increase of £1,580.

The income shows an increase of £4,117, of which £1,853 is for general supply, £858 for supply in bulk and £770 for tramway supply. The expenditure shows an increase of £2,537, of which £736 is for generation, £431 for distribution, £635 for rates and taxes and £401 for interest and sinking fund.

Colchester.—For the year ended March 31 the income of the tramways department was £10,269 (against £10,349), including £9,820 traffic revenue (against £9,873.)

The operating expenses were £8,046 (against £8,368), and the gross profit was £2,223 (against £1,980). Interest required £2,355 and repayment of loans £2,150, and after crediting amount from last year's account, the deficit was £2,170. The gross capital expenditure is £69,401. 1,738,172 passengers were carried and 431,789 car-miles run, against 1,725,948 passengers and 471,679 car-miles in 1909-10.

In a report by the general manager and engineer (Mr. R. C. Bullough) it is stated that the energy consumption per car-mile fell from 1·46 to 1·34 units, giving a saving of £250 in seven months.

Devonport.—The total revenue of the electricity department for the year ended March 31 was £18,035, including £16,418 from the sale of electricity for lighting, power and traction.

The expenses were £11,371, leaving a gross profit of £6,664 to meet dividends on and redemption of stock (£3,884) and interest and instalment of loans (£2,754), leaving a net profit of £26. The outstanding capital expenditure is £118,501. The total works costs were 1·344d. per unit sold (against 1·279d.), and the total costs (including capital charges) were 0·914d. (against 0·938d.). There are 531 consumers (439), and the equivalent of 41,610 (35,357) 8 c.p. lamps is connected. 2,222,470 units were generated; 530,214 units were sold for private and 36,512 for public lighting and 1,122,019 for traction, a total of 1,742,295 units sold against 1,651,614.

Dover.—The capital expended on the electricity undertaking at March 31 was £188,853, an increase of £1,659 over 1909–10.

The year's revenue was £22,574. Total expenditure was £9,131, leaving gross profit £13,443, to meet interest (£7,726) and sinking fund (£4,795) The net profit (£922) has been applied in reducing the outstanding deficit on net revenue account, which now stands at £4,624. Total works costs were 1·91d. per unit sold against 2·08d. 1,147,458 units were sold, including 596,992 to private consumers, 413,480 to the tramways department and 136,986 to the public lamps (65 arcs and 193 30-watt equivalent incandescent lamps). Total maximum supply demanded 416 kw. a.c. and 327 kw. d.c. Total connections equivalent to 54,826 30-watt lamps, an increase of 2,557 30-watt lamps.

Hull.—The City electrical engineer (Mr. H. Bell) has presented the seventeenth annual report of the electricity supply undertaking.

The gross revenue increased from £53,839 to £61,434. The working expenses were £28,687, leaving a gross profit of £32,746, an increase of £5,937. After capital charges, income tax, &c., had been met, the net balance carried to reserve was £8,223, bringing up the total unexpended balance in that fund to £10,838. The increased sales of current for lighting was approximately 6 per cent., and for power 27 per cent. The works costs were 0·69d. and the total working cost 0·88d. per unit sold. Very considerable extensions of plant and mains were about to be carried out, which, when the preliminary expenses in connection with the scheme had been met during the current year, Mr. Bell anticipates will produce more satisfactory results than have been obtained during the past year.

The City Accountant (Mr. W. H. Smith) has also presented the accounts of the undertaking, which showed that the income from sales of current amounted to £57,574, including lighting, £32,115. 16s. 9d.; power, £24,710. 5s.; and public lighting, £747. 15s. Sundry revenue brought the total to £61,434. 7s. 4d.

Lancaster.—The accounts of the electricity supply department for the year ended March last show capital expenditure £63,252 (no increase), of which £16,661 has been repaid or set aside for repayment.

Revenue was £9,133 and working and general expenses were £5,367, and, after providing £45 for allowances and bad debts, the gross profit was £3,721, to which has to be added bank interest £98. Capital charges were £3,331, and £400 has been placed to stock redemption fund (as a special contribution) and £88 to reserve. 774,530 units were sold (compared with 754,454 in previous year), revenue per unit was 2·62d.(2·79d.) and total cost 1·41d. (1·48d.) The total connections are 49,035 (equivalent) 8 c.p. lamps for lighting and 482 H.P. for power (exclusive of tramways).

The capital expenditure of the tramways department was £43,330 and £10,946 has been applied to reduction of debt, and £3,000 placed to reserve or renewals fund. Revenue was £5,445, working expenses were £5,376, interest required £1,337, and sinking fund £1,383, the year's deficit being £2,652 (against £2,897 in the previous year). 1,375,136 passengers were carried, 171,589 car-miles run and 248,611 units used. Total revenue per car-mile was 7·62d., working expenses were 5·06d. excluding, and 7·52d. including power.

Luton.—Capital expenditure of the electricity department for 1910–11 was £71,678, an increase of £5,389, over the preceding year.

Total revenue was £15,021. Working expenses were £6,942 and gross profit £8,079. Interest required £2,190, sinking fund, &c., £2,721, and after paying cost of new loans (£40) there was a net profit of £3,128. 2,782,631 units were generated (against 2,341,880) and 2,360,009 units sold (against 1,891,352) including 2,007,265 to private consumers (against 1,494,927). The equivalent of 38,709 8 c.p. lamps is connected (against 34,910), motors are equal to 2,338 H.P. (against 2,028 H.P.) and the heating connections are equal to 113 kw. (against nil). The total maximum supply demanded was 1,310 kw. (against 1,173 kw.)

Manchester.—The traffic revenue of the tramways department for the year ended March was £799,079 (against £777,219), other revenue amounted to £8,531 (£8,546) and the net revenue of the parcels department was £2,484 (£2,263), the total income being £810,094 (11,195d. per car-mile), against £788,029 (11,02d.).

The working expenses were £519,142 (against £511,070), the gross profit was £290,952 (£276,959), and after adding bank interest, &c. (£11,616 against £5,431) the available balance was £302,568 (against £282,390). After providing for interest (£55,227, against £53,500), rent of leased tramways (£24,597, against £25,753) and other charges, there was a net balance of £214,023, out of which £48,709 was contributed to sinking fund and loan instalments, £86,250 to reserve, renewals and depreciation fund, £4,064 to street improvement and £75,000 to relief of rates. The gross capital expended is £1,981,161 (against £1,957,594). The length of track operated at end of year was 182 miles 1,694 yds., an increase of nearly a mile; there were 600 cars, an increase of 18; the passengers carried were 165,800,077 (against 159,049,096), the car-mileage was 17,367,200 (against 17,161,774) and the number of units of energy used 29,063,006 (1·673 per car-mile) against 29,335,144 (1·709).

Stafford.—The income of the electricity department for the year ended March 31 was £4,920, including £4,596 from sale of current by meter and £180 from public lighting.

The expenses were £2,190, and after paying interest, sinking fund and income tax and providing £600 for depreciation there was a net profit of £152. The capital expended is £32,500. Of the 475,358 units sold, 8,225 were supplied to the public lamps, 152,818 were sold by contract and 314,315 supplied to private consumers. The total maximum supply demanded was 304 kw., and the equivalent of 26,904 8 c.p. lamps is connected.

Stalybridge, &c., Tramways and Electricity Board.—The accounts for the year ended March 31 show outstanding capital expenditure on the tramways of £237,582, and on the electricity dept of £209,978.

The revenue of the tramways was £36,785 (against £38,055), and the expenditure £27,229, (against £28,962), leaving a gross profit of £9,556, and after paying interest (£8,735) and providing for sinking fund (£6,759), there was a deficit of £5,938 (against £6,449). 9,718,195 passengers were carried (against 10,190,944) and 1,209,268 car-miles run (against 1,295,018)

The revenue of the electricity department was £32,067 (against £30,103), and the working expenses were £16,927 (against £16,757), leaving a gross profit of £15,140 (against £13,348). Interest required

Digitized by Google

£8,510 (£7,867), and sinking fund £6,634 (£5,951), leaving a deficit of £5 (£469). 15,265,200 (13,959,778) units were generated; 11,388,087 (10,023,140) units were sold to private consumers, and 1,907,254 (2,055,012) supplied to the tramways department. The works costs were 0·243d. per unit sold (against 0·266d.), the total works costs were 0·306d. (against 0·333d.), and the total costs (including capital charges) were 0·579d. (against 0·607d.) The average revenue for the total supply was 0·576d. per unit (against 0·593d.), and for private supply 0·547d. (against 0·546d.)

Sunderland.—The annual report of the Tramways Department has been issued, and show total receipts for the year ended March 31, of £58,889. After paying expenses (including interest and sinking fund) there was a nett profit of £4,344, an increase of £756 over 1909-10. The passengers carried numbered 14,561,672.

Warrington.—The total income of the electricity supply department for the year ended March 31 was £19,386 (against £16,818), including £18,494 from sale of current (against £16,189).

The working expenses were £10,512, leaving a gross profit of £8,873, against £7,587. Interest came to £2,760 and sinking fund to £3,446, leaving a net profit of £2,668. The gross capital expended was £100,770, an increase of £2,500. The maximum load was 1,917 kw. (against 1,625 kw.) and the number (equivalent) of 8 c.p. lamps connected was 121,649 (against 106,143). 2,757,582 units were sold (excluding traction) against 2,243,822.

In the report of the borough electrical engineer and tramways manager (Mr. F. V. L. Mathias) it is stated that the undertaking continues to make good progress. The consumption of current increased by 18·53 per cent. There was an increase of 529,317 units in the power demand, but there was a drop of 15,557 units in the demand for lighting. The works costs were 0·481d. (against 0·489d.) and the total costs 0·656d. (against 0·644d.). 417 new consumers were connected to the mains during the year.

Wellington (N.Z.).—The revenue of the electric lighting department for the year to March last was £45,587 (increase £773). Working expenses show a net decrease £2,324, due to the economical working of the Parsons turbine. Capital charges were £17,632 (increase £979), and net profit, after provision for depreciation, was £4,346 (against £2,228).

Revenue from tramways and power supply was £142,788 (increase £3,327), and working expenses were £95,965 (increase £3,018). After meeting capital charges and placing £14,407 to depreciation, the net profit was £6,225 (against £6,123). Capital expenditure during the year was £7,791.

West Ham.—The total income of the tramways department for the year was £131,542, and the net profit £19,542, compared with £18,409 for 1910-11.

Zeehan (Tasmania).—The accounts of the municipal electricity undertaking for the year ended December, 1910, show revenue £3,808 (against £2,749 in 1909), expenditure £2,898 (£2,069). Interest at 4 per cent. and sinking fund at 1 per cent. absorbed £425 (£425), and net profit was £485 (£253). Average revenue per unit sold was 4·243d., and cost of generation 3·882d. The prices range from 9d. (maximum for lighting) to 2½d. (minimum for power).

TRADE NOTES AND NOTICES.

TENDERS INVITED

The Council of the Metropolitan Borough of POPLAR invite tenders for the supply, delivery and erection at their Glaucus-street electricity works of overhead coal bunker, coal conveyor and extension and modification to existing coal conveyor. Specification and form of tender from the borough electrical engineer (Mr. J. Horace Bowden). Tenders to the Town Clerk (Mr. Leonard Potts), Council Offices, High-street, Poplar, London, E., by 10 a.m., July 15. See also an advertisement.

STOKE NEWINGTON (London) Public Library's Committee invite tenders for the installation of wires and fittings for electric lighting and ventilating at the Public Library, Church-street, Stoke Newington. Copies of specification and forms of tender from the librarian and clerk (Mr. George Preece), Public Library, Stoke Newington, N., where tenders are to be delivered by July 10. See also an advertisement.

CALCUTTA ELECTRIC SUPPLY CORPN. (LTD.) are prepared to receive tenders for the supply, delivery and erection at the site of their Cossipore station, Calcutta, of auxiliary plant, and pipework. Copies of specification, drawings, &c., from the Secretary of the company, Mr. Francis R. Reeves, Salisbury House, London Wall, London, E.C., to whom tenders by 10 a.m., July 24. Specification and drawings can be seen at, but not obtained from, the offices of Messrs. Kennedy & Jenkin, consulting engineers, 17, Victoria-street, London, S.W. See also an advertisement.

ALDERSHOT Urban District Council invite tenders for supply and erection at their electricity works of one 135 kw. Diesel direct-coupled set. Specifications and further particulars from the engineer, Mr. F. Garside, Electricity Works, Laburnum-road, Aldershot. Tenders to the Clerk to the Council, Mr. W. E. Foster, by noon July 4. See also an advertisement.

The Tramways and Electricity Committee of BELFAST Corporation invite tenders for the supply of a circulating water pump and a motor-driven air pump. Specifications and form of contract from the city electrical engineer, Mr. T. W. Bloxam. Tenders to the town clerk, Mr. R. Meyer, by 10 a.m. Monday, July 17. See also an advertisement.

Tenders are invited (up to Aug. 15) for the supply of (*a*) 80,000 insulators and (*b*) indiarubber covered wire to the Postmaster-General's Department in VICTORIA, and (up to Aug. 23) for the supply of letter box fronts to the Postmaster-General's Department in QUEENSLAND. Tender forms and specifications from the Commonwealth Office, 72, Victoria-street, London, S.W. See also advertisements.

Tenders are invited up to Aug. 9 for supply of four motor cars (petrol) complete and for the supply of letter box fronts to the Postmaster-General's Department in SOUTH AUSTRALIA. Tender forms and specifications from the Australian Commonwealth Offices, 72, Victoria-street, London, S.W. See an advertisement.

Tenders are invited (up to July 18) for the supply of 4 tons 6 cwt. bare hard-drawn copper cables, and (up to July 21) for the supply of 35,700 incandescent electric lamps to the City of MELBOURNE, Australia. Copies of specification, tender forms, &c., from the agents for the City Council (McIlwraith, McEacharn & Co. Ppty., Ltd.), Billiter-square-buildings, London, E.C. See also advertisements.

Tenders are also invited for supply of lead-covered and vulcanised rubber-covered cable to the City of MELBOURNE. Specifications, &c., from the agents for the City Council, Messrs. McIlwraith, McEacharn & Co. Proprietory (Ltd.), Billiter-square-buildings, London, E.C., to whom tenders by noon Friday, July 7.

ECCLES Corporation invite tenders for supply and erection of a high-efficiency type centrifugal pump, driven direct by s.ph. a.c. motor (approx. output 63,000 gallons per hour against 35 ft.). Tenders to Town Clerk by July 17.

Tenders are also invited for supply of 150 miles insulated wire and 5 miles of telegraph cable to the Postmaster-General's Department in Victoria. Tender forms and specifications from the Commonwealth Office, 72, Victoria-street, London, S.W.

The Great Southern & Western Railway Co., Kingsbridge Terminus, DUBLIN, require tenders by 10 a.m. July 5 for one year's supply of stores and materials, including electric light carbons, copper, iron, steel, oils, &c. Forms of tender from the Stores, Inchicore, Dublin.

SWINFORD (co. Mayo) Electric Lighting Committee invite tenders for the electric lighting of the town. Specifications from the Clerk to Swinford Rural Council, to whom tenders by 11 a.m. July 10. The requirements include suction gas plant, engines and dynamos, storage battery switchboard, overhead lines and street lamps.

CARDIFF Corporation require tenders by 10 a.m. July 14 for the supply of economisers and induced draught installation and supply and laying of cables. Forms of tender from Mr. A. Ellis, The Hayes, Cardiff.

The directors of the Great Southern & Western Rly. Co. (Kingsbridge, DUBLIN) require tenders for annual supply of stores, including arc lamp carbons, wire, tools, metals, &c. Tenders by 10 a.m. July 5.

HESTON and ISLEWORTH Education Committee require tenders by 10 a.m. July 5 for electric lighting of schools in district. Specifications from Mr. C. E. Ryecroft, Electricity Works, Hounslow.

LONDONDERRY Corporation require tenders by mid-day July 7 for wiring, fittings, lamps, switchboards, connections, &c., for the electric lighting of the new Guildhall.

ROTHERHAM Corporation want tenders by July 8 for 12 months' supply of single vulcanised bitumen covered cable and electricity meters. Particulars from the Borough Electrical Engineer.

GREENOCK Corporation want tenders by 10 a.m. June 30 for 12 months' supply of oil and engine room stores to the electricity department. Specifications from the Burgh Electrical Engineer.

REDDITCH Council invite tenders for supply of single-phase alternator direct coupled to Willans steam turbine, condensing plant and pipe work. Tenders to the Clerk by 5 p.m. July 10.

TUNBRIDGE WELLS Council invite tenders (until July 8) for year's supply h.t. and l.t. cables. Tenders to Town Clerk.

Digitized by Google

LONDON County Council require tenders by 11 a.m. July 4 for four electric traversers for car-sheds. Specification, &c., from the Clerk.

The Deputy Postmaster-General, HOBART, will receive tenders until noon July 31 for supply of telegraph and telephone material. Specifications, &c., from 72, Victoria-street, London, S.W.

The Deputy Postmaster-General, BRISBANE, will receive tenders until noon Aug. 16 for supply of paper-insulated lead-covered cable, and silk and cotton insulated lead-covered telephone switchboard cable, covered wire, g.i. and steel standard wire, c.i. pipes, iron and steel poles, insulators and copper wire, and accessories. Specifications, &c., from 72, Victoria-street, London, S.W.

The time for the receipt of tenders by the Ministry of Public Works, Constantinople, for an electric power and tramway concession for JERUSALEM, is extended to Sept. 13. Specifications (in French) may be seen at 73, Basinghall-street, London, E.C.

The Metropolitan Water and Sewerage Board, Albert-street, BRISBANE, Queensland, want tenders by noon Jan. 30 next for supply and erection, of one, two or three complete units, each consisting of power generating plant and pump or pumps to lift not less than 6,000,000 gallons per day. Particulars from the Secretary.

Tenders are invited up to July 19 for the supply of insulators, telephones, copper and iron wire to the Postmaster-General's Department in QUEENSLAND, and up to July 25 for the supply of 12 sections of a branching multiple magneto lamp signalling switchboard, &c., or one automatic or semi-automatic switchboard, &c., to the Postmaster-General's Department, VICTORIA. **Tender forms, &c., from 72, Victoria-street, London, S.W.**

MORTLAKE (Victoria) Butter & Cheese Factory Co. require tenders by noon Aug. 14 for supply of dynamo and booster, storage batteries and accessories, switchboard, cables, &c. Specifications from Messrs. F. A. McCarty & Co., 31, Queen-street, Melbourne.

WELLINGTON (N.Z.) Corporation require tenders by 4 p.m. Aug. 24 for supply of a motor power waggon and accessories for the electric tramways department. Gonville and Castlecliff Tramway Board, Ridgway-street, WANGANUI (N.Z.) require tenders by 4 p.m. Aug. 14 for supply of overhead tramway material, feeders, &c. Conditions, &c., can be seen at 73, Basinghall-street, London, E.C. Representation in New Zealand is necessary.

Tenders will be received at the Royal Arsenals, SPEZIA and NAPLES until 11 a.m. July 11, for supply of incandescent electric lamps and brackets (total about £1,260). Conditions (in Italian) at 73, Basinghall-street, London, E.C. Local representation necessary.

The "Gaceta de Madrid" announces that tenders will be received up to noon July 4, at the Sección Colonial del Ministerio de Estado, MADRID, for the complete installation of a wireless telegraph station on the island of Fernando Po, for the purpose of carrying on telegraphic communications in the Gulf of Guinea. The cost is estimated at 62,150 pesetas (about £2,300) excluding excavation and foundation work. This call for tenders is reserved to Spanish firms, but should no award be made, a second adjudication will take place to which foreign firms will be admitted. In this latter event Spanish firms will be allowed a preferential margin not exceeding 10 per cent. over foreign estimates.

Tenders will be received at the Stadtbaudeputation Offices Breslau (Germany) on July 25 for supply of centrifugal pumps and electric motors.

TENDERS RECEIVED AND ACCEPTED.

Hammersmith (London) Electricity Committee have received the following tenders for supply and erection of high-pressure steam and feed-water pipes, exhaust steam feed-water heater and circulating pipes, steam valves and feed-water heaters :—

Aiton & Co. (*accepted*), £1,568; Edwin Danks & Co., £1,192; Foster Bros., £1,405; J. Spencer (Ltd.), £1,458; Babcock & Wilcox, £1,560; Stewarts & Lloyds, £1,625 and £1,685; E. Le Bas & Co., £1,635; J. Wilson & Co., £1,699. 10s.; Ashwell & Nesbit, £1,980; Wembley Heating Co., £2,160. Messrs. Aiton & Co. undertake delivery in eight weeks. The tender of the Alphonis Custodis Chimney Construction Co. (at £392. 15s.) for the erection of a chimney stack at the generating station extension has also been accepted. This stack is to be erected in lieu of a steel chimney included in the tender of the Sterling Boiler Co., accepted conditionally in January last.

Stepney (London) Council received the following tenders for the annual supply of carbons :—

W. Giepel & Co. ("Henrion" Carbons) (*accepted*) £810. 15s. 3d. and £720. 15s. 3d.; Electrocarbon (A. G.), £873. 3s. 6d.; C. W. Webster (Cia Fabrik de Carbones Electricos), £956. 7s.; Ship Carbons (Ltd.), £958. 18s. 7d.; Brush Co., £980. 5s. 11½d.; Electrical Co., £999. 12s. 3d.; Gilbert Arc Lamp Co., £1,030. 11s.2d.; Sloan Electrical Co., £1,066. 7s.2d.; General Electric Co., £1,110. 3s. 9d.; Globe Electric Co., £1,121. 4s.; Union Electric Co., £1,122. 17s. 3d.; Crompton & Co., £1,153. 6s. 9d.; Siemens Bros. Dynamo Works, £1,249. 15s.

Stepney (London) Council have accepted the following tenders for annual supplies :—

Reason Mfg. Co., meters (up to and including 10 amperes). £181. 5s.; demand indicators, £418. 5s.; time switches (up to and including 25 amperes), £275; British Thomson-Houston Co., meters above 10 amperes, £311. 11s.; Venner Time Switches (Ltd.), time switches above 25 amperes, £88; Kirk & Randall, erection of substation at Wapping, £4,435.

London County Council has accepted the tender of Dick, Kerr & Co. (at £2,093. 10s. 9d.) for the overhead electrical equipment of the Brixton-Herne Hill tramway, and the tender of H. L. Holloway (at £1,818) for the erection of workshops, store, &c., at Stockwell substation.

Cowans, Sheldon & Co. have received an order from the Imperial Japanese Navy for a 30-ton electric travelling crane for the Imperial Dockyard at Kure, Japan. The crane will deal with a load of 30 tons at a radius of 125 ft.

Southend Council have accepted the following tenders for meters :—Ferranti, Ltd., 3 amperes, £1. 16s. each; 5 amperes, £2; 10 amperes, £2. 5s.; Venner & Co., 100 5 ampere prepayment, £2. 5s. each.

Barking Electricity Committee have provisionally accepted the tender of A. E. Symes (at £2,497) for extensions to the electricit station buildings.

Worcester Council have accepted the tender of the Electric Construction Co. for a 200 kw. motor generator at £640, and that of the Phœnix Dynamo Co. for a 125 kw. alternator at £250.

Mansfield Council have placed an order with Bertram Thomas for switchgear at £116.

Fulham (London) Council have placed an order with A. Emanuel & Son for display fittings, radiators, &c., for the showrooms.

Mirfield Council have accepted the tender of Mather & Platt for electric pumping plant.

Radcliffe (Lancs.) Council have placed a contract with G. Longfield-Beasley for electric fire alarms at £410.

Southend Council have accepted the tender of How & Reed for wiring two ward blocks at the sanatorium at £45.

Government Contracts.—The following contracts were placed by British Government Departments during May :—

Admiralty.—Whipp & Bourne, circuit breakers, &c., Craigpark Elec. Cable Co., gutta percha; Edison & Swan Co., lampholders; D. Jaroslaw, mica; A. Graham & Co., navyphones.

War Office.—British Insulated and Helsby Cables, India Rubber Gutta Percha and Telegraph Works Co., Midland Electric Wire Co., Siemens Bros. & Co., Western Electric Co., Ward & Goldstone, and Hooper's Telegraph & India Rubber Works, electric cable; Crysdeo (Ltd.) and "Z" Electric Lamp Mfg. Co., incandescent electric lamps; Electric Construction Co., electric motors; J. Spencer, Ltd., telegraph poles.

India Office.—J. Stone & Co., dynamos.

Crown Agents for the Colonies.—Babcock & Wilcox, marine type boiler; Bullers Ltd., telegraph poles; Stewarts & Lloyds, boiler tubes; Shropshire Iron Co., copper wire.

Office of Works.—H. Hann, erection of new Wimbledon telephone exchange.

General Post Office.—British Insulated & Helsby Cables flexible cords, indicators, switchboards, p.c. cable, distribution cases and bronze wire; London Electric Wire Co., flexible cords, flameproof wire; British L. M. Ericsson Co., telephones, plugs; Western Electric Co., bell receivers, switchboards and apparatus for Mayfair exchange extension; Johnson & Phillips, p. c. cable; Siemens Bros. & Co., p.c. cable and submarine cables, distribution cases; Jones & Attwood, c.i. bends and couplings; Taylor, Tunnicliff & Co., insulators; Waterlow & Sons, Wheatstone paper; T. Bolton & Sons, and F. Smith & Co., bronze wire; J. C. Fuller & Son, flameproof wire; Rylands Bros., g.i. strand wire; Greig & Matthews and G. P. Trentham, laying pipes in Glasgow and Pontypridd, respectively; J. A. Ewart and W. H. Holman, laying pipes and earthenware ducts in South London and in Brighton, respectively; Peel-Conner Telephone Works, Local exchange equipment at Barry, Ilford, Nelson and Rotherham.

BUSINESS NOTICES.

Messrs. J. & H. Grevener notify that, owing to increase of business, they have decided to centralise their offices, works and warehouses at 40, Southwark-street, London, S.E., where all future communications should be addressed. The telegraphic address remains "Grevener London," telephone 7180 City (four lines).

The limited partnership between A. E. Woodhouse (Craven House, Kingsway, London, W.C.) and Edgar Jones (Mount Nessing, Albury, N.Z.), manufacturers and sellers of electrical appliances, trading as the Woodhouse Steel Casing Co., has been dissolved, and the business transferred to the Woodhouse Steel Casing Co. (Ltd.)

The partnership between C. A. Miller and L. Sandford-Thompson, electrical engineers, 54, Gordon-street, Glasgow, has been dissolved. Debts by Mr. Miller.

Messrs. Marsh, Son & Co., have removed from 15, Gerrard-street, Soho, to 167 and 169, Wardour-street, Oxford-street, London, W.

Plant for Sale.—Mr. A. Underwood, 3, Queen-street, London, E.C., has for sale a 220 H.P. compound vertical Allen engine coupled to a 220-volt 750-ampere dynamo, a 58 H.P. motor-generator (440 volts to 110/125) and a switchboard.

Coronation Pressure at Siemens.—Messrs. Siemens Bros. Dynamo Works inform us that their move in keeping their supplies department at 39, Upper Thames-street, London, open all night on Wednesday last week was much appreciated by contractors, who kept the staff busy right through the small hours. It may be safely asserted that more than one of the large displays of illumination would have been incomplete if there had not been some electrical supply firm to turn to in the dead of night.

Handbook of Electrical Literature.—We have received from Schulze & Co. (Leipzig) their "Handbuch der Elektrotechnischen Literatur, 1900-1910," which contains classified lists of electrical works by Continental authors and a good selection of the principal translations from English books on electrotechnical subjects. The Handbook is published at 1s.

Patents Development.—The owner of patent No. 16,183/1908, for "Improvements in or relating to telephony and telegraphy," desires to negotiate for the granting of licences thereunder. Particulars from Messrs. Lloyd Wise & Co., chartered patent agents and consulting engineers, 46, Lincoln's Inn Fields, London, W.C.

The proprietors of patent No. 23,878 of 1900 for "Improvements in process of and mechanism for separation of conductors from non-conductors" desire to enter into arrangements for exploiting same in this country. Applications to Messrs. Haseltine, Lake & Co., patent agents and consulting engineers, 7 and 8, Southampton-buildings, Chancery-lane, London, W.C.

Herr Theodor Hummel, 61, Klingenthalstrasse, Basle, Switzerland, wishes to grant licences for a patent system for the control of lights on staircases of buildings, &c.

Electrical Fittings at the R. A. S. Show, Norwich.—Messrs. Siemens Bros. & Co. inform us that the stand at the Royal Agricultural Show now being held at Norwich of Messrs. Boulton & Paul, electrical contractors, Rose-lane Works, Norwich, has been wired with "Stannos" and is fitted throughout with Holophane reflectors and Tantalum lamps. The Norwich Show was visited on Wednesday by the King.

BANKRUPTCIES, LIQUIDATIONS, &c.

The estates of John Munro & Co., electrical engineers, &c., 45, Yorkplace, Edinburgh, and of the sole partner, John Munro, have been sequestrated. Meeting to elect trustee and commissioners on June 30 at 18, George-street, Edinburgh.

Wm. Hy. Steed, motor and electrical engineer, 40, Charter-road, and carrying on business at 13, Stamford-street, Kingsway, Altrincham, has obtained an absolute order of discharge.

A meeting will be held on July 26 at Messrs. Elles, Sclaman & Co., No. 2, Bucklersbury, London, E.C., to receive an account of the winding-up of the Electric Conversion Synd. (Ltd.)

Deed of Assignment.—A dividend is to be paid under a deed of assignment executed on March 11, 1901, by Bernard G. Jones (trading as Bernard G. Jones & Co.), electrical engineer, &c., Newport, Mon. Claims to Mr. John Tamplin, Westgate-chambers, Newport, Mon.

COMPANIES' MEETINGS AND REPORTS.

Indo-European Telegraph Co. (Ltd.)

An extraordinary general meeting was held on Wednesday, under the presidency of Mr. J. HERBERT TRITTON.

The SECRETARY (Mr. John I. Bethell) having read the notice convening the meeting,

The CHAIRMAN said: Gentlemen, at the general meeting held on April 27 last the chairman of that meeting stated that the Articles of Association of the company, which were drawn up as far back as the year 1868, were no longer suitable to modern requirements, owing to the various alterations and additions to company law during the 40 years which have elapsed. He also informed you that the company's solicitors, who had often directed our attention to this matter, had recommended that the entire set of Articles should be re-drafted; that with this the directors had expressed their agreement, and that the work had been put in hand; also that the fresh Articles of Association would be presented to you for adoption at an extraordinary general meeting to be held at an early date. These fresh Articles are laid before you to-day for approval. They have been settled by an eminent counsel, and are approved by the board of directors. They have also been submitted to and approved by the Government directors of Germany and Russia. I will only add a few words to what was said on the last occasion as to the necessity for having new Articles, and our reasons for deciding that it is better not to attempt to revise the old ones. Provisions which were formerly inserted in Articles of Association, and which were then thought to be legal, are now, either by reason of alterations in the law or decisions of the Courts, ultra vires, and other provisions which were formerly inserted have been found to be superfluous. On the other hand, provisions which are found to be useful in the working of a company and are now usually inserted are not to be found in the old Articles. The old Articles are, in fact, now quite out of date. Taking all the above facts into consideration, the company's solicitors were of opinion, and counsel advised, that while the old Articles should undoubtedly be brought up to date, it was not practicable to alter them in a satisfactory manner, and that the proper way would be to prepare new Articles, embodying therein all that was not antiquated and useless in the old Articles, and inserting such new provisions as are now found to be generally useful.

The chairman proceeded to refer to the amendments and alterations which had been made in the Memorandum and Articles. This was followed by a resolution that the existing Articles should be cancelled and the new Articles as now submitted be approved.

The Right Hon. Sir FRANCIS MOWATT seconded the motion, which was carried unanimously without debate, and an intimation by the chairman that the confirmatory meeting is proposed to be held on July 17 terminated the proceedings.

Globe Telegraph & Trust Co. (Ltd.)

The 38th ordinary general meeting was held on Tuesday, under the presidency of the MARQUIS OF TWEEDDALE, K.T.

The SECRETARY (Mr. Sidney Collett) read the notice convening the meeting and the auditor's report.

The CHAIRMAN then said: The report we have to submit to you is the best we have ever presented to our shareholders during the 38 years of the Company's existence, and this follows last year's report which was an improvement on the one which preceded it. The dividends of the companies in which our investments are made are liable to fluctuations, and it is therefore impossible to foresee changes that may take place and which might affect the dividends we are enabled to distribute. The receipts for the 12 months to May 31 last, after deducting the usual working expenses, were £211,858, against £209,117 in the preceding year, an increase of £2,741. We have distributed three quarterly interim dividends of 2s. per share net to our shareholders and three interim dividends on the 6 per cent. preference shares, less tax. These distributions have absorbed £131,085 and the directors now recommend payment of a final dividend on the ordinary shares of 6s. per share net, making 6 per cent. net for the year against 5⅞ per cent. net last year. This, with the final 3s. on the preference shares, together absorbed £79,922, leaving £28,532 to be carried forward. This satisfactory result is largely due to the increased dividend we have received from the Telegraph Construction & Maintenance Co. During the year we have continued the policy of making a redistribution of some of the investments held by the Company, making the distribution of our capital more equal. In regard to the dividends we have received, that shown against the Mackay Companies common shares requires explanation. Some of the dividend relates to shares which have been sold so that although the return per cent. per annum is not quite so high as appears on the report, it is considerably better than in the preceding year, inasmuch as we have received this year a dividend of 5 per cent. against 4¼ per cent. Seven of the certificates held by this Company in the Submarine Cables Trust were drawn on May 4 at £120 per certificate. This drawing realised £840 and the money has also been invested in the common shares of the Mackay Company, while the coupons of reversion have been placed among the Company's securities and will some day be of considerable value. The valuation of our securities shows an increase over cost price of £494,130, or £124,000 better than this time last year. I now move the adoption of the report and accounts and the declaration of the dividend therein set out.

Sir JAMES PENDER, Bart., seconded the motion which, after a brief discussion, was carried unanimously.

The retiring director having been re-elected and the retiring auditors reappointed, a vote of thanks to the chairman and directors brought the proceedings to a close.

BOMBAY ELECTRIC SUPPLY & TRAMWAYS CO. (LTD.)—The report for 1910 states that the total revenue for the year (including sale of current to tramways) was £219,317, an increase of £21,489 (10·86 per cent.) over the previous year. Total expenditure was £122,139, increase £7,007 (6·09 per cent.). Net receipts (£97,177) show an increase of £14,482, or 17·5 per cent. Deducting £32,383 for debenture interest and other charges and adding amount brought forward (£4,567), the total available is £68,731. Preference dividend being paid, the balance was £32,748. The directors now recommend that £15,000 be placed to depreciation account and £6,000 to sinking fund for capital redemption, leaving £11,748 to be carried forward. Traffic receipts were £144,182, against £134,153. Working expenses in Bombay were £73,488, compared with £70,596. Balance of receipts over expenses was £73,222, compared with £65,918. Gross receipts for the year, including amount represented by sale of current to tramways, amounted to £66,921, compared with £57,552. Receipts exclusive of revenue represented by current supplied for tramways, were £37,043, against £31,493 for 1909. Working expenses were £43,897, against £40,934. The balance (£23,024) compares with a balance of £16,618 for 1909. The capital expenditure during the year, in connection with the construction of the new Kussara power station, on new mains

Digitized by Google

and the development otherwise of the supply of electricity for lighting and power, and the further equipment and improvement of the tramways, amounted to £129,882.

CHADBURN'S (SHIP) TELEGRAPH CO. (LTD.)—For the year ended March 31 the profit was £18,843, and after deducting directors' fees, depreciation, &c. (£7,867) and adding balance from last year (£1,774.), the total was £12,750. The preference dividend and an interim dividend at the rate of 6 per cent. on the ordinary stock absorbed £5,400, leaving £7,349. 14s. 10d., out of which the directors propose to pay a dividend on the ordinary shares of 10 per cent. per annum (less tax) for the half-year ending March 31 (making 8 per cent. for the year) carrying forward £4,349. 14s. 10d.

At the meeting on Tuesday Mr. W. Chadburn said that they had had a satisfactory year and there was an increased profit compared with 1910. A good deal of the apparent increase, however, was simply due to the fact that they had invoiced more work than they had executed. The directors had decided to proceed with the proposed extensions, which should give a further capacity of 25 to 30 per cent.

CHILIAN ELECTRIC TRAMWAY & LIGHT CO. (LTD.)—The result of the past year's working, after deducting all charges, is a balance of £106,564. 6s. 1d., added to £8,988. 17s. 10d. brought forward, making £115,553. 3s. 11d. £60,000 has been placed to renewals reserve and £5,000 to insurance suspense account, leaving £50,553. 3s. 11d., preference dividend absorbs £39,000, leaving £11,553. 3s. 11d. to be carried forward. The tramways have carried 83,148,755 passengers, earning $7,308,957·95, against 75,670,443 passengers and $6,436,720·15 in 1909. Receipts for light and power during 1910 amounted to $4,070,272·84, and the total working expenditure was $2,438,005·53, leaving net profit $1,632,267·31, against $1,224,764·77. Additional rolling stock is on order. The demand for light and power by private consumers is steadily developing. A strike of the tramway staff in July, 1910, affected the traffic receipts, but an agreement was arrived at, and the full operating service was resumed. The workshops staff, however, continued their unreasonable demands, and it was found necessary to discharge the whole staff and engage new men.

GREENWOOD & BATLEY (LTD.)—The accounts for the year ended March 31 show, after providing for debenture interest, management expenses and doubtful debts, a profit of £20,197. 19s. 4d., added to £2,211. 12s. brought forward. The directors report that although some of the subsidiary and connected companies gave satisfactory results, they consider it advisable to depreciate and also to provide for a possible loss in connection with others, and they have, therefore, transferred £10,000 from reserve, together with £3,000 from the balance of £22,409. 11s. 4d., leaving £19,409. 11s. 4d. to credit of profit and loss, out of which the directors have written off £10,000 for depreciation, and they recommend that the 7 per cent. preference dividend be declared (£7,027. 17s. 3d.), leaving £2,381. 14s. 1d. to be carried forward.

MARCONI INTERNATIONAL MARINE COMMUNICATION CO. (LTD.)—The report for 1910 states that at the end of 1909 the company possessed and worked 143 telegraph stations on board ships on the high seas, and on Dec. 31., 1910, the number had increased to 250, and at the present date there are 303 such telegraph stations at work. The profit for the year, after allowing for debenture interest, was £10,765, leaving (with amount brought forward) £15,321. The directors recommend a dividend for the year at the rate of 5 per cent., absorbing £10,202, leaving £5,118 to be carried forward..

THAMES IRONWORKS, SHIPBUILDING & ENGINEERING CO. (LTD.)—The directors' report for 1910 states that the electrical department has been kept busy throughout the year in the manufacture of the "Thames" snap switch, which has been adopted by the Admiralty, and with other Admiralty orders for electrical fittings. An electrical installation for the Metropolitan Water Board at their Walton pumping station has also been completed. The work on the electrical installation of H.M.S. "Thunderer" has been much advanced.

J. G. WHITE & CO. (LTD.)—At the meeting yesterday (Thursday) the chairman (Mr. J. G. White) stated that the net profit for the year under review amounted to £91,466, against £64,801, and constituted not only by far the largest profit ever shown, but the greatest increase ever made over the preceding year. They considered the position of the business in hand as being quite satisfactory and the outlook as most encouraging. Mr. White proceeded to analyse the accounts. Their investments stood at £150,781, an increase of £28,000. The dividends on their securities, omitting one large item which could not be considered as a recurring amount, totalled £12,439, or more than sufficient to pay 6 per cent. on the company's entire preference and share capital. The company's financial department was becoming increasingly important, and it was likely to grow. Its growth had not interfered with the efficiency of the engineering and construction departments, which were better able than ever to undertake a wide range of engineering and construction work. Recent additions had been branches for designing and supervising hydro-electric and other water-power developments, water supply systems and sewage disposal plant. During the year the increased business in the operation of tramways and electric lighting had resulted in the formation of a separate department for the management of such concerns. The balance available for allocation amounted to £88,812, and in considering the distribution of that sum they had to bear in mind that the strong position of the company was due to a considerable extent to the building up of substantial reserves. During the 10½ years of the company's existence it would have paid in dividends £160,708, and had retained in the business £182,787, mainly contributed by the ordinary shareholders for the benefit of the company. The directors believed in continuing that policy of building up reserves, and, therefore, proposed that £15,000 should be allocated to writing off the balance of the purchase of business account, and that £15,000 should be placed to the credit of a new reserve for the equalisation of future dividends. They then felt justified in recommending a dividend of 7 per cent. for the half-year on both preferred and ordinary shares, making a total of 12 per cent. for the year, and that a further dividend of 10s. per share should be paid on the ordinary shares, leaving £19,812 to be carried forward.

NEW COMPANIES AND RECEIVERSHIPS.

NEW COMPANIES.

RECORD ELECTRICAL CO. (LTD.) (116,488.)—Reg. June 24, capital £20,000 in £1 shares (10,000 preference), to carry on the business of manufacturers of and dealers in electrical machinery and appliances, electric measuring instruments, meters, wires, cables, &c., and to adopt an agreement between C. W. Von Roemer, J. W. Record and T. J. Boorne. Private company. First directors are J. W. Record (man. dir.) and others to be appointed by the subscribers.

TITAN TRACKWORK CO. (LTD.) (116,457.)—Reg. June 20, capital £5,000 in £1 shares, to carry on the business of tramway and railway track manufacturers, layers and maintainers of permanent ways, points, crossings, switches and rails, &c. Private company. First directors: S. Osborn, J. P. and W. McKennel (appointed by Samuel Osborn & Co.), and E. Parry and L. W. Costa (appointed by Railway & General Engineering Co.).

RECEIVERSHIPS.

HILO MFG. CO. (LTD.)—Notice of appointment of H. Dobell, 3, Lombard-street, E.C., as receiver and manager, by order of Court dated June 13, 1911, has been filed.

CITY NOTES.

MEMORANDA (June 29).—**Bank rate 3 per cent.** (March 9, 1911.) **Price of silver, 24⅜d. per oz. Consols 79⅛—79⅜ for money and for account. Consols Pay Day, July 5; Stock and Shares Continuation Day, July 12; Ticket Day, July 13; Pay Days, June 30 and July 14; Mining Shares Carry Over Day, July 11.**

PRICES OF METALS (London).—*Copper*, **cash, 56⅞; three months 57½.** *Lead*, **13½ cash, 13⅝ three months.** *Spelter*, **24⅜—24¼.** *Tin*, **194¾ cash, 189½ three months.** *Iron*, **Cleveland, cash, 46/3, three months, 47.**

AMERICAN TELEPHONE & TELEGRAPH CO.—The directors of this company have authorised the issue of $50,000,000 of new stock for new construction work. A quarterly dividend of 2½ per cent. has been declared.

BAHIA TRAMWAYS, LIGHT & POWER CO.—The revenue for May was £13,333 (increase £2,625), and the aggregate from Jan. 1, £64,000 (increase £11,172).

COMPANIES STRUCK OFF THE REGISTER.—The following were struck off the Register of Joint Stock Companies on June 23:—

Eaton Telephone Disinfector Co., Electro-Brass Co., Garonne Valley Electric Supply Co.

EASTERN TELEGRAPH CO. (LTD.)—This company announce payment on July 15 next of dividend at the rate of 3½ per cent. per annum (less tax) on the preference stock for the quarter ending 30th inst., and a first quarterly interim dividend of 1¼ per cent. on the ordinary stock (tax free) in respect of profits for the year ending Dec. 31, 1911. The transfer books of the ordinary stock will be closed from July 7 to 14 inclusive.

EASTERN EXTENSION, AUSTRALASIA & CHINA TELEGRAPH CO. (LTD.)—The directors have declared an interim dividend for the quarter ended March 31 of 2s. 6d. per share, tax free, payable 15th prox. The share register will be closed from July 7 to 14 inclusive.

NATIONAL ELECTRIC SUPPLY CO. (LTD.)—An interim dividend of 3s. per share (less tax) on the ordinary shares for the half-year to June 30 has been declared.

NATIONAL TELEPHONE CO., LTD.—Subject to final audit, the directors recommend the following dividends for the half-year to June 30:—At the rate of: 6 per cent. on both the preferred and deferred stocks, less tax, carrying £200,000 to reserve, and about £18,000 forward.

RIO DE JANEIRO TRAMWAYS, LIGHT & POWER CO.—A dividend of 1¼ per cent. is payable Aug. 1.

SHAWINIGAN WATER & POWER CO. (LTD.)—A dividend has been declared of 1½ per cent. on the common stock (equal 5 per cent. per annum) for the quarter ending 30th inst.

STOCK EXCHANGE NOTICES.—The Stock Exchange Committee have appointed July 5 a special settling-day in and granted a quotation to the provisional certificates for a further issue of 20,000 £10 shares, fully and partly (£4) paid, of the *City of Santos Improvements Co. (Ltd.)*, and £61,400 4½ per cent. debentures of £100 each of the *Christchurch Tramway Board*. The Committee have been asked to allow the further issue of £21,000 4½ per cent. first mortgage prior lien gold bonds of £100 each of the *Montreal Water & Power Co.*, and $500,000 additional common stock and $250,000 additional 5 per cent. consolidated first mortgage bonds for $1,000 each of the *Shawinigan Water & Power Co.* to be quoted.

NOTES.

Car Meter Results.

THE annual report of Mr. T. B. GOODYER, manager of the Croydon Corporation Tramways, which was adopted at the meeting of the Council this week, furnishes convincing testimony of the advantages of meters for checking the energy consumed by tramcars. Mr. GOODYER has also prepared a valuable tabular summary, of which we have received a copy, of the information he has obtained from 88 municipal tramway undertakings with whom he has communicated. It appears that no less than 42 of these undertakings have fitted meters to *all* their cars, 17 have meters installed on *some* cars, whilst in 29 cases no use is made of meters. It is interesting to learn that ampere-hour meters are in use on 38 systems, watt-hour meters on 15 systems, and time meters in the remaining six instances. We also notice that more than three-quarters of those tramway managers who express an opinion of the value of meters in the detection of faulty cars reply in favour of using them.

As to the saving of electrical energy, the power consumption on the Croydon tramways during the 12 months ended March 31, 1910, averaged 1·281 units per car-mile, and for the year ended March 31st last 0·976 units per car-mile, meters having been fitted on all the cars (70) since April 22, 1910. It will be seen that the saving in energy resulting from the use of meters represents about 24 per cent., whilst the financial saving is equivalent to over £92 per car per annum. It would be interesting, we think, if information could also be obtained in such cases as to the effect on the maximum demand made by the tramways on the power station. If it were found that the maximum demand did not decrease in proportion to the smaller output the load factor would, of course, be worse, and in consequence the electricity supply department would be justified in demanding a higher price per unit, so reducing to some extent the financial saving which is claimed. On the other hand, it must be remembered that the economy brought about by car-meters is not confined to energy consumption, and at Croydon a saving of approximately 26 per cent. has resulted in respect of brake shoes, whilst other economies will doubtless also occur. The effect of the smaller energy consumption of the Croydon cars is shown in the records of the electricity supply department, the output for the past year being actually less than in the 12 months ended March 31, 1909, in spite of a satisfactory increase in revenue in the sales for power and heating and cooking.

AN inspection of the tabulated replies referred to above shows what a great difference there is in individual cases between the percentage reduction in the energy consumption per car-mile; this is doubtless partly accounted for by the amount of skill exercised by motormen in the different towns previous to the introduction of meters. Thus, in Accrington, Brighton, Burnley and Darwen the saving per annum did not exceed 5 per cent.; whilst at Bury it was about 22 per cent., at Gloucester 21 per cent., at Leith 23 per cent., at Wolverhampton 20 per cent., and, as mentioned above, 24 per cent. in the case of Croydon. A number of undertakings have not yet had the meters installed long enough to reply definitely in regard to the saving effected, but we think the above figures are sufficient to show that the question of installing meters should be seriously considered by all tramway undertakers. In this connection the London County Council, with about 1,600 cars, have just installed 40 ampere-hour meters as an experiment, motor

Digitized by Google

watt-hour meters having been discarded from a number of cars as unsuitable for the conditions. It is interesting to notice that in the case of this undertaking special arrangements are necessary owing to the liability to reversal of polarity on the conduit routes; and the meters are arranged in pairs with ratchet and pawl mechanism.

Shop Front Lighting.

THERE is not much doubt that shop front lighting is quite an important advertisement of the particular illuminant used, provided, of course, that the effect produced is good. The gas companies appreciate this point of view, and on that account they are making a special effort to carry out as much shop front lighting as possible by means of high-pressure g To compete with this we have incandescent electric lighting and arc lighting; but, generally speaking, the question resolves itself into competition between what are sometimes called "gas arcs" and electric arcs. Mr. A. H. SEABROOK gave some interesting figures of the cost of such lighting with electric arc lamps at the meeting last week of the Incorporated Municipal Electrical Association at Brighton. The prospects of the small flame arc lamp, to which he then referred, seem particularly good for this class of work. There is, however, another aspect of the question to which too much attention cannot be drawn. Everyone desires, as far as possible, to be relieved of unnecessary trouble. Shopkeepers form no exception to this rule, and as they have their time fully occupied in earning their living, they naturally prefer to give their attention to subjects more particularly connected with their business than to the maintenance of their lamps.

GAS companies fully realise the importance of this aspect of the case. Consequently, they run high-pressure mains with branches on the exterior of business premises; and since they undertake the maintenance of the lamps the whole system is under their control, and the shopkeeper is entirely relieved from trouble and annoyance. In electric arc lighting this is often not the case. Electricity supply authorities have not the same powers as the gas companies. The shopkeeper, if he wishes to use electric light for the outside of his premises, probably has to buy his own arc lamps, and also to keep them in order. This may involve a certain amount of trouble to a non-technical man, and consequently when the gas company comes along with an offer to relieve him of all responsibility in the matter, the shopkeeper feels a strong inducement to accept the "gas arcs."

FROM the point of view of competition between gas and electricity there is no doubt that hiring powers are most important, and, further, that too much stress cannot be laid upon the necessity of a good business organisation. Competition there must always be, and the sooner that electricity undertakings are prepared to meet it the better. Mr. SEABROOK went so far as to say that he would rather not work in agreement with any gas undertaking; he preferred to keep his enemy at arm's length. We do not feel that we are prepared to go so far, for competition beyond a certain limit is undoubtedly undesirable, and may end in no one making any money. The aim of every business should be to make money on the most satisfactory basis, and if by having some working agreement with the gas companies, as the electricity companies have at present in the Holborn area, more profit can be made, it appears to us that this is the best thing.

The Attraction of Cheap Power Supply.

THE question—When is Electric Power Cheap?—was raised recently at a public meeting convened at Edinburgh for the purpose of considering what steps could be taken to advance the industrial and commercial interests of Edinburgh, Leith and Midlothian. The offer of cheap land, cheap labour and cheap power supply, and the provision of good transit facilities, were all suggested during the course of the discussion. That a cheap supply of electric power is by no means a negligible asset to a town is becoming more and more evident. Mr. A. H. SEABROOK was among the first to appreciate this fact, and during his sojourn at West Ham that borough experienced a considerable influx of manufacturing works, attracted by the low price at which electrical energy was obtainable. Other towns have since experienced the same effect. As to what constitutes cheap power, however, it is impossible to formulate any fixed definition, since it must naturally be determined by other factors, such as the cost of fuel in the district and the price of competing sources of power. Ex-Bailie MACKENZIE considered that 1d. per unit was by no means cheap power and suggested that ½d. per unit would be cheap from March to October. This, of course, raises the chief difficulty of the supply authority, that whilst the plant standing idle throughout the summer months could be employed profitably at such a rate, ½d. per unit would not usually be sufficient to provide for capital charges on the additional plant that would be necessary in the winter months. It is, therefore to the encouragement of a restricted hour demand that particular attention should be paid in such cases, and we think that more might be done by supply authorities as regards encouraging an electrochemical load which could be supplied continuously except for certain hours during the winter months.

Oil Fuel for Steam Boilers.—The Consolidated Gas, Electric Light & Power Co. (U.S.A.) are employing in their Westport station coal and oil simultaneously for fuel for their boilers. Each furnace is provided with four oil burners, the oil being delivered to the boilers at 20 lb. pressure per square in. and atomised by means of a steam jet. Under actual operating conditions the maximum boiler outputs obtained during seven-hour runs were as follows: With coal 1,188 H.P., with oil 702 H.P., with coal and oil together 1,445 H.P. It was found that a 2,000 kw. station load can be carried by each boiler when using coal and oil together with as much ease and certainty as 1,200kw. per boiler can be carried when coal is alone used. The results indicate a gain in output of 66⅔ per cent. by the use of the oil, or a saving of 40 per cent. in the cost of the boiler equipment for a given output. The cost of oil for producing a certain amount of steam is about 33 per cent. more than that of coal.

Cable Interruptions.	Date of Interruption
Assab—Perim	July 8, 1909
Malta—Tripoli	April 20, 1910
Latakia—Palura	May 26, 1910

National Electric Light Association.—The attendance at the recent Annual Convention at New York of this Association reached 5,150, or almost double that of the St. Louis Convention last year when the attendance was a record one.

Wireless Telegraphy in Australia.—In reference to the advertisement which recently appeared in our columns inviting applications for the post of wireless telegraph expert in Australia, we are able to announce that Mr. J. G. Balsillie has been selected for the post and will shortly enter upon his duties.

Electricity in Textile Mills.—The Council of the Textile Institute, Manchester, has decided to co-operate with the Institution of Electrical Engineers in an investigation of the application of electricity to the textile industry. In the recent annual report of the Council of the Institution it was mentioned that the Special Committee had held several meetings.

Long-Distance Telephony.—The "Daily Chronicle" says that telephonic communication was successfully established between Paris and Aberdeen, a distance of about 1,000 miles, on Wednesday afternoon. Communication was made by way of London, Dover and Calais. It is stated that it was possible to hear quite distinctly and that there was no "buzzing."

International Congress of Applied Chemistry.—The eighth International Congress of Applied Chemistry is to be held at Washington and New York from September 4 to 13, 1912. Papers will be accepted for reading and discussion in the various sections, preference being given to those specially adapted for international discussion; and they must be sent in not later than July 1, 1912. Preliminary particulars may be obtained from the hon. secretary to the British Organising Committee, Mr. C. G. Cresswell, Society of Chemical Industry, Palace-chambers, Westminster, S.W.

Diversion of Niagara Water—The "Electrical World" mentions that an extension for two years (until June 29, 1913) of the present regulations under the Burton law governing the diversion of water from Niagara River for commercial power has been recommended by the United States Senate Committee on foreign relations. It was explained that the existing treaty with Canada, under which the diversion of water on both the United States and Canadian sides is limited, would expire in another 10 years, and it is proposed to continue the present *status quo* for that time.

Smithsonian Institution.—We have received a copy of the annual report of the Smithsonian Institution, Washington, U.S.A., for the year ended June 30th, 1909. As in previous years the greater part of the volume consists of an appendix containing a miscellaneous selection of Papers dealing with scientific investigations. Included among these are Prof. J. A. Fleming's Royal Institution lecture of June 4, 1909, on "Researches in Radiotelegraphy," and the 1909 presidential address of Sir J. J. Thomson to the British Association on "Recent Progress in Physics."

Accuracy of Meters.—An interesting report on this subject was presented by the Meter Committee at the recent meeting of the National Electric Light Association. A table is given showing the great improvement in accuracy between the years 1907 and 1910. During this period the light-load accuracy has increased from 84·4 per cent. to 95·9 per cent. and the heavy-load accuracy from 92 per cent. to 98·4 per cent.

The "Electrical World" states that of 7,558 tests of electric meters reported to the New York Public Service Commission, Second District, in April, 1911, 412, or 5·45 per cent., were fast; 6,046, or 79·99 per cent., were accurate, and 1,100, or 14·56 per cent., were slow.

New German Patent Law.—The Bill to amend the law on the working of patents in Germany has been passed in an amended form and came into force on July 1.

In place of Art. 11 of the Patent Law of April, 1891, the new law provides that "should a patentee refuse permission to an applicant for the use of the invention in return for reasonable compensation and guarantees, the right to use the invention may, if the grant of such permission is required in the public interest, be given to the applicant. The right may be given in a limited form and be made dependent upon conditions. The patent may be revoked (in the absence of international agreements to the contrary) if the invention be worked exclusively or mainly outside the German Empire or the protected territories. The attempt to transfer a patent to another does not avoid revocation. No decision shall be come to against a patentee under the new law until after three years from the notification of the grant of the patent.

National Physical Laboratory.—The National Experimental Tank, which we described in our issue of March 24th, p. 946, was formally opened on Wednesday afternoon by the Right Hon. Lord Rayleigh, O.M., F.R.S. Sir Archibald Geikie, K.C.B., chairman of the General Board of the Laboratory, presided at the ceremony. After Lord Rayleigh had delivered an address, Mr. A. F. Yarrow, who, it will be remembered, has given £20,000 towards the construction of the tank, emphasised the importance of British shipbuilders having such a tank in order that they might possess the same facilities for research as their foreign competitors. The carriage which tows the models along the tank was then started by the Marchioness of Bristol. After the ceremony the various departments of the Laboratory were open for inspection.

Electric Power Supply at Turin Exhibition.—"The Times Engineering Supplement" mentions that the electric light and power required for the Turin Exhibition is furnished by a number of firms by means of machines of different types. Water and fuel are provided by the authorities, who will also make some payment for the energy. Steam is generated by four sets of water-tube boilers, two being of the Tosi type and two by Babcock and Wilcox. The engines include a Tosi horizontal tandem of 600-800 H.P., a Tosi turbine with surface condenser, a vertical engine of 500 H.P. with Lentz valves, and a 1,200 H.P. turbine by Swiderski, of Leipzig. A two-cycle Diesel engine of 1,000 H.P. is supplied by Messrs. Tosi, one of 400 H.P. by the Société Italienne Langen et Wolf, and a third of 1,000 H.P. by Messrs. Sulzer, of Winterthur. The electrical machines come partly from the Tecnomasio Italiano Brown-Boveri and partly from the Savigliano factories.

Power Factors.—In a Paper presented by Mr. F. D. Newbury at the recent convention of the National Electric Light Association a table was given of the power factors of various kinds of central-station loads. Among those mentioned were the following:—Incandescent lighting with small reducing transformers, 90 to 95 per cent.; single-phase induction motor, squirrel-cage rotor, ½ H.P. to 1 H.P., 55 to 75 per cent., average 68 per cent. at rated load; ditto 1 H.P. to 10 H.P., 75 to 86 per cent., average 82 per cent. at rated load; polyphase induction motor, squirrel-cage rotor, 1 H.P. to 10 H.P., 75 to 91 per cent., average 85 per cent. at rated load; ditto, 10 H.P. to 50 H.P., 85 to 92 per cent., average 89 per cent. at rated load; polyphase induction motors, phase-wound rotors, 5 H.P. to 20 H.P., 80 to 89 per cent., average 86 per cent. at rated load; ditto, 20 H.P. to 100 H.P., 82 to 90 per cent., average 87 per cent. at rated load; arc furnaces, 80 to 90 per cent.; induction furnaces, 60 to 70 per cent.; electric-welding transformers, 50 to 70 per cent. In general, for the average central station load, consisting of lighting and motor service, a power factor of 80 per cent. may be assumed; and 70 per cent. for a plant having a large proportion of induction motors, arc lighting, electric furnaces or electric welding load.

Electrification of the Lapland Railway.—"Engineering" states that, in spite of an unusually severe winter, with a tremendous downfall of snow, the work on the Porjus Railway has been energetically proceeded with, and the work in connection with the hydro-electric station at Porjus has been commenced. The construction of the power line from Porjus will be taken in hand this month, and part of the line is expected to be finished before the end of the year. The directors of the two electric companies who have secured the contract for this important railway—Siemens-Schuckert Werke, Berlin, and the General Swedish Electric Co.—with other engineers, have just paid a visit to Lapland to inspect the localities and undertake some trial ore transports on the Kiruna–Riksgränsen section of the Lapland Railway—the portion which is to be electrified. The present large steam locomotives, of the so-called "R" type, haul, as a rule, 28 waggons, each with a load of 30 tons. The electric trains will comprise 40 waggons

Digitized by Google

of the same size, propelled by two electric locomotives, one pulling and one pushing, with an aggregate capacity of some 2,000 H.P., and the average speed will be about twice that of the present trains. The increased speed will make it possible to despatch 12 trains in the day instead of the present nine trains, without increasing the number of passing places. The experimental trains had the weight of the future electric trains—that is, 40 waggons—but they were each hauled by two locomotives. Negotiations have also been entered into with the Norwegian railway authorities about a possible electrification of the Norwegian section of the line from Riksgränsen to Narvik.

An Electrical Winding Engine on the North-East Coast.—In a recent issue of "The Times Engineering Supplement" is given a description of an electric winding engine that has been installed at Esh Collieries, Waterhouses, co. Durham, by Messrs Pease & Partners. The depth of the shaft is 162 ft., the time of each wind 15 seconds, the average winding speed 648ft. per minute, and the time allowed for changing 10 seconds. The winding gear is fitted with a coned drum, varying from 5 ft. 6 in. to 7 ft. 6 in. in diameter. The 100 B.H.P. motor is of the three-phase type, and is supplied with current at 440 volts and a frequency of 40. The motor drives on to the drum shaft through a flexible coupling and a train of machine-cut helical gearing. The winder is fitted with automatic winding gear, which, in the event of an overwind, trips the main switch and cuts off the supply to the motor, and also operates the main post brakes. This gear also comes into operation in the event of a failure of the supply, and is further fitted with an emergency lever, by which it may be brought into operation by hand. The switch gear consists of an iron-clad column fitted with a three-pole oil switch with overload and no-voltage release; and an isolating switch is also provided. This latter is interlocked with the main switch and the various doors of the switch columns. The controller is of the rising liquid type, the control being carried out by means of one lever, which is "off" when in the central position. A small centrifugal pump and motor are provided on the controller. This set constantly delivers water from a storage tank contained in the controller bedplate to the tank containing the electrodes. The tank is fitted with a rising and falling shutter, which is operated from the control lever, and regulates the level of the liquid in the tank. The reversing switches are mounted upon the shaft that operates the controller, and one switch is provided for each running direction. The switches are worked by means of a link motion from the control lever.

Current Topics.

Subjects of current interest dealt with in this issue include the following:—

Mr. D. Owen contributes an article on "Brownian Movements."

We give a description of the Dunston power station of the Newcastle-upon-Tyne Electric Supply Co. This station was formally opened on Wednesday.

We continue our account of the Conference on Education and Training of Engineers organised by the Institution of Civil Engineers.

At the annual general meeting of the Incorporated Municipal Electrical Association at Brighton last Friday the annual report of the Council was presented, and the officers for the ensuing year were elected. The new president is Mr. G. Wilkinson of Harrogate, and next year's Convention is to be held in that town.

At a recent meeting of the Physical Society, Prof. Ernest Wilson read a Paper on "High-tension Electrostatic Wattmeters."

The introduction of electrically-operated stoking plant into gas works continues to have very satisfactory results, a large saving being effected. Perth Gas Committee recommend its adoption.

The text of the Memorandum issued by the Postmaster-General in connection with the Telephone Transfer Bill is issued, and is accompanied by the recital of the Memorandum as to the transfer of the Company's employés to the State, which was read in the House of Commons on August 9, 1905, during the debate on the agreement for the purchase of the Company's undertaking.

The Railway and Canal Commissioners have commenced the arbitration proceedings in regard to the purchase of the National Telephone Co.'s undertaking by the Postmaster-General.

Kingston-on-Thames Council are sending a deputation to Germany to inspect the works of the M.A.N. Company, in order to obtain information of the latest type of oil engine for their electricity works.

Municipal Loans.—*Dublin* Corporation have received sanction to a loan of £50,000 and *Eccles* a loan of £3,294 for additional generating plant, &c.—*Willesden* Council have also received sanction to a loan of £8,000 for mains and services.—Inquiries have been held at *Gloucester*, *Hornsey*, *Torquay* and *Aldershot* into applications for sanction to loans for extensions of the electricity undertakings.—*Salford* Corporation have applied for permission to borrow £3,000 for mains and services, and *Bath* Corporation have asked for sanction to a loan of £400.

Parliamentary.—A House of Lords Committee has approved the Central London Railway Bill.

The Metropolitan Railway and the Sidmouth Gas and Electricity Bills have also passed the committee stage.

The Macclesfield and District Rail-less Electric Traction Bill has been withdrawn.

Companies' Meetings and Reports.—Amongst the reports and meetings of companies are the directors' reports of the General Electric, Chili Telephone & Puebla Tramway, Light & Power Companies, the Madras Electric Supply Corpn. and Royce Limited, and the meetings of the India Rubber, Gutta Percha & Telegraph Works Co., the Marconi International Marine Communication Co., and the Metropolitan District Railway Co., &c.

OBITUARY.

Dr. G. J. STONEY.—We regret to record the death of Dr. Geo. J. Stoney, Sc.D., F.R.S., which took place in London on Wednesday.

Dr. Stoney was born in King's County, Ireland, in February, 1826. When he left Trinity College, Dublin, he became astronomical assistant at the Parsonstown Observatory and subsequently he competed for the Fellowship at Trinity, winning the second place and the Madden Prize. Later he was appointed professor of natural philosophy at Queen's College, Galway. After five years' work in Galway he returned to Dublin to become Secretary of the Queen's University, where he remained till the dissolution of the University in 1882. As Secretary of the University, Dr. Stoney wrote various reports and minutes on educational matters. In 1861 he was elected a Fellow of the Royal Society. His official duties curtailed his leisure for scientific research, but it may be mentioned that it was Dr. Stoney who first suggested the now familiar term "electron." He also made interesting investigations on helium, and he came to the conclusion that helium was constantly escaping from the earth. Apart from his University distinctions and University work he served constantly on the Council of the Royal Society. Lord Lister, when President, appointed him one of the vice-presidents. He was a Visitor of the Royal Observatory at Greenwich and of the Royal Institution in London. He was honorary secretary to the Royal Dublin Society for over 20 years, and at the Sheffield meeting of the British Association he was president of Section A. He was a foreign member of the Academy of Science at Washington and of the Philosophical Society of America. He served on the Committee of the British Association which decided on the "C.G.S." system of units, and on many other committees of the Association. Deceased leaves two sons and three daughters. His eldest son, Gerald, who has just been elected a Fellow of the Royal Society, is manager of the well-known turbine works of Messrs. C. A. Parsons & Co.

F. E. BAINES.—The death is also announced of Mr. F. E. Baines, a former assistant secretary at the General Post Office. Deceased, who had been Inspector-General of Mails, Surveyor-General of Telegraphs and Organiser of the Parcels Post, died at Hampstead (London) on Tuesday. He was the author of an interesting work (in two volumes) entitled "Forty Years at the Post Office."

JOHN GILLEY.—The death is announced of Mr. John Gilley, who has been with the Foster Engineering Co. from the commencement. Deceased, who was the Company's first outside representative, died on June 14 from consumption. Previous to his connection with the Foster Engineering Co., he was on the staff of the Jandus Arc Lamp and Electric Co. The many trade friends of Mr. Gilley will read this announcement with regret, as he was much esteemed by all with whom he came in contact.

APPOINTMENTS VACANT AND FILLED.

Dundalk Urban District Council invite applications for the appointment of resident engineer for their electricity undertaking. The successful applicant will act as clerk of works, under the Council's

Digitized by Google

consulting engineer, during the construction of the works. Salary £250 per annum. Applications to the town clerk (Mr. Mathew Comerford), Town Hall, Dundalk, by Monday, July 10. See also an advertisement.

A meter tester and testing assistant is required for one of the electricity works of the County Borough of Stoke-on-Trent. Commencing salary 26s. per week. Forms of applications, &c., from the borough electrical engineer (Mr. C. H. Yeaman), Hanley electricity works, Stoke-on-Trent. See advertisement.

The Governors of Heriot-Watt College, Edinburgh, require an organiser of technical education. Salary £300 per annum. Applications to the Clerk, 20, York-place, Edinburgh, by July 24.

Lecturers in mechanical engineering (salary £100, rising to £170), and in chemistry and metallurgy (salary £200, rising to £250) are required at the Municipal Technical Schools, Wolverhampton. Applications by July 17 to the Secretary, Education Offices, Town Hall, Wolverhampton.

An assistant for engineering subjects including mathematics, and with some knowledge of chemistry and physics, is required for Gloucester Technical Schools. Salary £120 to £140. Applications to Mr. R. Leach, Technical Schools, Gloucester.

An assistant science master is required for Waterford Central Technical Institute. Salary £100, rising to £130. Particulars from the Principal. Applications by noon, July 29.

Mr. X. Mudd, late of Trinity College, Cambridge, has been appointed lecturer in applied mathematics at the Grey University College, Bloemfontein, S. Africa.

Mr. John W. Hogg, late of the Jandus Arc Lamp & Electric Co., has been appointed sales engineer of the electricity department of Sunderland Corporation.

Consequent upon the retirement of Mr. J. J. Steinitz the following staff changes are announced by the Brush Electrical Engineering Co.:—Mr. B. Broadhurst is to be general manager, headquarters at Loughborough; Mr. W. Johnstone becomes assistant manager, headquarters in London; and Mr. G. S. Wood (at present works manager at the Witton works of the General Electric Co.) has been appointed works manager at Loughborough.

Mr. G. Waring has been appointed shift engineer at Eccles electricity works.

INSTITUTIONS AND SOCIETIES.

Iron and Steel Institute.—A preliminary programme of the forthcoming annual meeting of the Iron and Steel Institute, which is to be held at Turin on October 2nd and 3rd, has been issued. Arrangements have been made for members resident in Great Britain to travel together. A special train leaves Holborn Viaduct Station at 9.30 a.m. on Friday, September 29th; Friday night will be spent in Paris and Saturday night at Aix-les-Bains. Turin will be reached in the evening of Sunday, October 1st. Among the Papers to be read are: "On the application of electrical energy to the manufacture of iron and steel in Italy," by Cav. Ing. Remo Catani; "On the autogenous welding of metals," by Dr. Francesco Carnevali; "On the physico-chemical properties of slags," by Prof. J. H. L. Vogt. From Wednesday, October 4th, to Monday, October 16th, a tour in Italy has been arranged, including Genoa, Rome, Naples, Florence and Milan. The party will leave Milan on Monday, October 16th, spend the night at Montreux, leaving the following evening by special train for Boulogne and London.

Institute of Metals.—The fifth volume of proceedings of this Institute has just been published. The major portion of the "Journal" consists of a series of Papers read at the annual general meeting of the Institute in January last. Among these Papers are: "A New Critical Point in Copper-Zinc Alloys; Its Interpretation and Influence on their Properties," by Prof. H. C. H. Carpenter and Mr. C. A. Edwards; "Some Practical Experience with the Corrosion of Metals," by Engineer Rear-Admiral J. T. Corner, C.B.; "Some Tests on White Anti-friction Bearing Metals," by Mr. H. J. Humphries and Prof. C. A. Smith; "The Adhesion of Electro-deposited Silver in Relation to the Nature of German Silver Basis Metal," by Prof. A. McWilliam and Mr. W. R. Barclay; and "The First Report to the Corrosion Committee," by Mr. G. D. Bengough. Particulars are also given of the newly-formed Birmingham branch of the Institute, whilst abstracts of Papers relating to the non-ferrous metals and the industries connected therewith are continued in the present volume. The Institute having recently become an incorporated institution, the concluding section of the "Journal" is devoted to the new memorandum and articles of association: there also appears a list of members of the Institute.

EDUCATIONAL NOTICES.

University of Sheffield.—The faculty of applied science comprises the departments of engineering, metallurgy, coal mining and architecture. The courses in engineering or in metallurgy extend over three years and prepare respectively for the degree of B.Eng. or B.Met. of the university. The lecture courses commence Oct. 4 and the technical laboratory courses on Sept. 18. Prospectuses and other particulars from the registrar, Mr. W. M. Gibbons.

City and Guilds Technical College.—This college provides a scientific training for students preparing to become electrical and mechanical engineers or chemists and for engineering pupils who desire to supplement their practical training by a two years' course of instruction in the principles of engineering science. The instruction is mainly given in the various laboratories, most of which have been recently re-equipped. The subjects of the entrance examination are mathematics and English, but the matriculation of any British University is accepted. The courses in electrical and mechanical engineering cover a period of two years and those in chemistry three years. There are also arrangements for three-year courses in engineering. Particulars at the college, Leonard-street, City-road, London, E.C., or from the City and Guilds of London Institute, Gresham College, Basinghall-street, London, E.C.

Heriot-Watt College, Edinburgh.—This college gives theoretical and practical training for mechanical, electrical and mining engineers, technical chemists, &c. The training for engineers consists of three years in the college and three years apprenticeship, on the sandwich system, in a local engineering works. Further information may be obtained from the Principal of the College, Mr. A. P. Laurie, M.A., D.Sc., or from the Heriot Trust Offices, 20, York-place, Edinburgh.

University College, Reading.—An endowment fund of £200,000 has been presented to this college so as to enable the Council within the next four years to apply for a charter of incorporation as an independent university. The donors are Lady Wantage, £50,000; Mr. G. W. Palmer and Mrs. Palmer, £100,000; and Mr. Alfred Palmer, £50,000. Mr. Alfred Palmer has also decided to present the college the freehold of 4 acres of land adjoining the main college site, and now used for horticultural purposes by the college under lease from him.

University College, University of London.—A gift of £30,000 towards the construction and equipment of the new chemical laboratories at University College has been made by Mr. Ralph C. Forster, who had previously given £4,500 to complete the purchase of the site.

Bootle Municipal Technical School.—The late Mr. Thos. Davies, of Bootle, has left £1,000 for a scholarship in applied electricity or engineering at the Liverpool University.

ARRANGEMENTS FOR THE WEEK.

THURSDAY, July 13th.

TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION.

Annual Congress at Edinburgh. Papers on "Transfer Fares," by Mr. C. W. Shepherd, J.P. (General Manager, Edinburgh Corporation Tramways); and "A Few Reasons why Electric Traction in England remains Stationary," by Mr. G. H. J. Hooghwinkel.

FRIDAY, July 14th.

TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION.

Congress at Edinburgh. Papers on "Notes on Tramway Problems," by Mr. C. W. Mallins (General Manager, Liverpool Corporation Tramways); and "Tramways and Light Railways Legislation of the Future," by Ald. W. Ivey (West Ham Tramways Committee).

THE LONDON ELECTRICAL ENGINEERS.

Officer Commanding, Col. H. M. Leaf.

The following orders have been issued for the current week:—

Monday, July 10th to July 14th.—Headquarters will be open from 10 a.m. to 4 p.m.

Saturday, July 15th.—Sheerness Detachment will parade at Headquarters at 3 p.m. Dress: Service dress, drill order, with water bottle and haversack. Arms will be issued before this parade.

Plymouth Detachment will parade as above at 9:30 a.m. Arms will be issued before the parade.

BRIGHTON CORPORATION ELECTRICITY SUPPLY AND TRAMWAY ACCOUNTS.

The Brighton electric supply undertaking has been in operation for 19 years, and is noteworthy for the large output per head of population: and as Brighton is by no means an industrial town, many engineers may be surprised to learn that the output for power last year amounted to nearly 1½ million units, exclusive of over 2 million units supplied for electric traction. In his report upon the accounts Mr. J. Christie, engineer and manager of the undertaking, draws attention to the fact that the motor load must be approaching saturation point, but he is optimistic as to developments in electric heating and cooking, and anticipates that it will shortly be necessary for his Committee to consider what steps should be taken to meet the probable requirements of consumers in this direction.

In common with the majority of other engineers, Mr. Christie believes that the low-water mark in the progress of the electric supply undertakings brought about by the general use of metal filament lamps has been passed. In view of the fact that the output for private lighting last year at Brighton increased by 100,880 units, and now stands at 4,193,701 units, there are good grounds for this opinion. As regards the total output of 10,285,680 units, this shows an increase of 13¾ per cent. over last year's figures, the traction supply accounting for an increase of 84,804 units, whilst the special contract supply to the railway company and others has increased from 812,805 to 1,502,536 units. In connection with the supply to the tramways the price per unit has been reduced from 1·35d. to 1·2d.; and taking into consideration the conditions of the supply, Mr. Christie believes the tramway department now have the benefit of the cheapest supply of electrical energy in the country. Indeed, he does not consider it possible to make any further concessions until the costs of generation have been materially reduced.

During the past year 21 additional motors have been hired to consumers, bringing the total number of motors now on hire to 210, representing 1,041 H.P. The total number of consumers connected to the mains at March 31st last was 5,239, 219 new services having been laid during the year. This alone shows that the department is making good progress.

From the analysis of the accounts given below it will be seen that the total cost, excluding capital charges, has slightly increased, one or two of the items standing at a higher figure than a year ago. It should be noted that, on the average, 11d. per ton more has been paid for coal than was the case last year, which is equivalent to £1,108 on the quantity used. Due, however, to a better load factor and various economies in the operation of the plant, the weight of fuel consumed per unit sold has been substantially reduced—viz., from 5·95 lb. to 5·26 lb.—thus more than neutralising the increased price. The large increase in the cost of repairs and maintenance is due to alterations of the high-tension switchgear, oil cooling, hot well and circulating water pipe systems and repairs to sea defences. These items are, of course, exceptional, and will result in the plant being brought up to date, so that the benefit will be reaped in future years.

The maximum load on the feeders was 5,140 kw., the load factor being, therefore, 22·8 per cent., as against 21·8 per cent. last year and 20·1 per cent. in 1908-9. This steady increase in the load factor must be very gratifying to Mr. Christie.

As regards the prices obtained for energy, mention has already been made of the charge for energy supplied to the tramways. The lighting supply brought in an average revenue of 3·44d. per unit, the power supply 1·07d. per unit, public lighting 1·75d. per unit, bulk supply to Aldrington and Hove 1·83d. per unit and the contract supply 0·73d. per unit, the average for the whole output being 2·08d. per unit.

Turning now to the financial results, the total revenue from all sources was £98,821, an increase of £4,566 over that of the previous year. Working expenses absorbed 50 per cent., or £49,555 of this, and after providing for capital charges, &c., a net surplus of £4,751 is shown, as against £6,251 last year. Mr. Christie concludes his report by strongly recommending that this surplus be transferred to supplement the reserve fund, which at present stands at £12,993. He considers it is most essential that this fund should be conserved and brought up to the full statutory limit at the earliest possible date, as undoubtedly heavy calls will have to be made on it in the near future for the re-piling of the quay wall. Also, in view of the great strides being made in turbine design, if the undertaking is to be kept up to date he thinks it would be advisable, in the best interests of the department, to spend a portion of the reserve in reconstructing the old turbines in turn, as funds permit, in order to reduce their steam consumption.

We give below an analysis of the accounts for the year ended March 31, 1911, together with the cost per unit sold for each item, the latter figures for the previous year being also given:—

		Cost per unit sold. 1910-11.	1909-10.
Generating Costs.			
Fuel	£16,079	0·38d.	0·40d.
Oil, waste, stores, &c.	815	0·02d.	0·01d.
Wages at stations	5,666	0·13d.	0·15d.
Repairs and maintenance	6,123	0·14d.	0·08d.
Total Generating Costs	£28,683	0·67d.	0·64d.
Distribution Costs.			
Repairs of mains, meters, transformers, motors, &c.	£2,710	0·06d.	0·06d.
Total Distribution Costs	£2,710	0·06d.	0·06d.
Management Costs.			
Salaries, &c.	£5,124	0·12d.	0·13d.
Stationery and printing	195	—	—
Consulting engineer	1,000	0·03d.	—
Insurance	209	0·01d.	0·01d.
Law and compensation	16	—	—
General establishment and miscellaneous	1,287	0·03d.	0·02d
Total Management Costs	£7,831	0·18d.	0·16d.
Rents, rates and taxes	£4,087	0·10d.	0·11d.
TOTAL COSTS (*ex* capital charges and public lamps)	**£43,311**	**1·01d.**	**0·99d.**
Public lamps	£4,500	—	—
Work executed for consumers	£1,581	—	—
Capital Charges.			
Interest	£18,931	0·44d.	0·51d.
Sinking fund	£25,583	0·60d.	0·69d.
Total Capital Charges	£44,514	1·04d.	1·20d.
TOTAL COSTS (including capital charges and public lamps)	**£93,906**	**2·19d.**	**2·34d.**
Revenue.			
Private lighting	£60,188	—	—
Power	6,569	—	—
Special contracts and bulk	4,965	—	—
Traction	10,116	—	—
Public lamps	12,044	—	—
Meter and motor rents	3,017	—	—
Sundries (less bad debts)	1,758	—	—
TOTAL REVENUE (less bad debts)	**£98,657**	**2·31d.**	**2·51d.**
Balance	£4,751	0·12d.	0·17d.

The capital expenditure during the 12 months ended March 31st last was £23,433, making the total capital expenditure to that date £824,186. The various items included in this total are set out below, together with the cost per kilowatt of plant installed:—

	Total.	Per kw. installed.
Land	£17,946	£2·5
Buildings	149,889	20·7
Machinery	336,365	46·8
Mains	254,920	35·3
Meters, &c.	41,711	5·8
Motors for hire	8,031	1·2
Change of voltage	4,263	0·6
Purchase of patent rights	1,337	0·2
Engineer's commission	1,497	0·2
Office furniture	550	0·1
General expenses	1,127	0·1
Purchase of company's undertaking	5,000	0·7
Parliamentary expenses	1,550	0·2
	£824,186	£114·4

Electric Tramway Undertaking.

Although this undertaking has been handicapped in several ways during the past year, it is yet able to show a profit of £137 on the year's working. In the first place, as Mr. W. Marsh, the engineer and manager, points out in his annual report, no Easter was included in the 12 months ended March 31st last, whilst the previous period of 12 months included two Easters. In view of the absence of the extra traffic which is always a feature of the Easter holidays, although the revenue for the year showed a decrease of £121 compared with the previous year's figure this result was not unsatisfactory. A number of passenger shelters have been erected in various parts of the town, and the whole cost has been charged against the year's revenue. The advertisements, however, bring in more than sufficient revenue to light and maintain the shelters.

Mr. Marsh mentions that the cost of repairs and renewals to the permanent way has been increasing somewhat rapidly of recent years, and the maximum has not been quite reached. The figure for 1910 was £5,554, and it is very satisfactory to notice that the whole of the renewals have been paid for out of the year's revenue, without any calls on the reserve fund. The undertaking has 17 acres of paving to maintain, and Mr. Marsh thinks few other tramway undertakings are so severely handicapped in having had the track paved with an inferior kind of wood. Granite paving is now being installed on several routes.

The number of car-miles run during the 12 months ended March 31st last was 1,126,676, 10,708,184 passengers being carried, and 2,023,109 units of electricity being used (*i.e.*, 1·79 per car-mile). The average traffic revenue per car-mile was 10·46d., and the working expenses 8·02d., or 74·23 per cent. of the receipts. We give below an analysis of the working expenses, together with the cost per car-mile of each item :—

		Per car-mile.
Traffic Expenses.		
Superintendence	£144	0·03d.
Wages of motormen and conductors	9,801	2·09d.
Wages of other traffic employés	541	0·11d.
Cleaning and oiling cars	862	0·18d.
Cleaning track	369	0·08d.
Fuel, light and water for depots	129	0·03d.
Ticket check	894	0·19d.
Uniforms	359	0·08d.
Miscellaneous	154	0·03d.
Total Traffic Expenses	£13,253	2·82d.
Repairs and Renewals		
Permanent way	£5,554	1·18d.
Electrical equipment of line	452	0·10d.
Buildings and fixtures	297	0·06d.
Machinery and plant	153	0·03d.
Cars	3,930	0·84d.
Total Repairs and Maintenance	£10,386	2·21d.
Management, &c.		
Salaries	£1,018	0·22d.
Store expenses	163	0·03d.
Printing and stationery	135	0·03d.
Fuel, light and water for offices	56	0·01d.
Law charges	7	0·09d.
Accident and fire insurance	753	0·16d.
Rents, rates	908	0·19d.
Miscellaneous	875	0·19d.
Total Management, &c.	£3,916	0·83d.
Power Expenses		
Current at 1·2d. per unit	£10,115	2·16d.

Advertisements, &c.	1,623	0·35d.
TOTAL REVENUE	£50,747	10·81d.
Balance	£137	0·03d.

HIGH-TENSION ELECTROSTATIC WATTMETERS.*

BY ERNEST WILSON.

It is well known that the quadrant electrometer can be used as a wattmeter on alternating-current circuits, and various methods have been devised for connecting it to the mains. The usual method is to impress upon the quadrants an E.M.F. proportional to the current in the main circuit, and to impress upon the needle either the voltage of the mains or a voltage proportional thereto. This is accomplished by passing the main current through a non-inductive shunt and connecting the quadrants thereto, and using a potential transformer when the voltage of supply has to be subdivided. The drawback to this method is that usually about 1 volt is required across the shunt, and when very large currents have to be dealt with the energy dissipated becomes large. As an alternative, "series" or "current" transformers can be employed, in which case the drop between the terminals of the primary coil can be very much reduced; but when considerable accuracy is required, especially on low power factors, this method is not reliable.

The use of a quadrature transformer whose primary winding is in the main circuit has been successfully developed by Dr. W. E. Sumpner in connection with iron-cored instruments.† It has also been developed in connection with electrostatic wattmeters,‡ and a diagram of one set of the connections is given in Fig. 1. In this diagram Q is the electrometer, whose moving system is connected to the ends of a non-inductive resistance, R, which is in series with

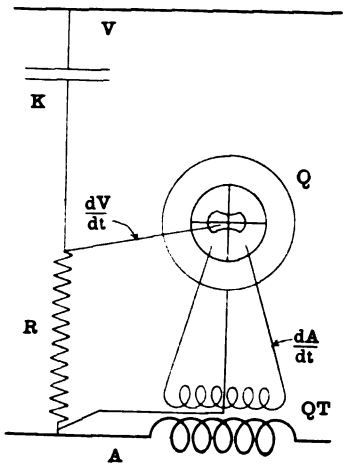

Fig. 1.

a condenser, K, across the supply mains. The quadrants of the electrometer are connected to the terminals of the secondary circuit of a quadrature transformer, QT.

The action of this instrument depends upon the equation

$$\frac{(2\pi f)^2}{T}\int_0^T VA\,dt = \frac{1}{T}\int_0^T \left(\frac{dV}{dt}\cdot\frac{dA}{dt}\right)dt,$$

in which V is the voltage of the supply mains, A the amperes in the work circuit, f the frequency of supply and T the periodic time.

The condenser can also be replaced by an inductive resistance. The arrangement shown in Fig. 1, however, has the advantage that the condenser K can be designed to withstand very high voltages, but it is only strictly accurate on sine curves. A number of experiments made with varying wave-forms showed that it is fairly reliable with approximately sine curves. The alternative arrangement has the disadvantage that it involves an inductive resistance capable of withstanding very high voltages, but it is independent of variation in wave-form. Each of these types is, of course, afflicted with the error arising from the proportion of the total voltage V to the voltage across the non-inductive resistance R, which on very high voltage systems becomes very small.

Fig. 2 shows in diagrammatic form a high-tension wattmeter whose moving system is directly connected to, and experiences the full voltage of, supply. The quadrants are connected to a small air-cored generator, G, which rotates in a magnetic field produced by and proportional to the current A in the work circuit. This generator is driven at known speed by a small motor, which can be either

* Abstract of a Paper read before the Physical Society. A brief account of the discussion that followed the reading of this Paper appeared in The Electrician for May 19, p. 212.

† "Journal" I.E.E., 1908, Vol. XLI., p. 227.

‡ British Patent Specifications 26,512, 1905, and 2,707, 1904.

Digitized by Google

direct or alternating current. It was found that when the voltage V impressed upon the moving system is of the order 20,000 volts or more, the quadrants require a considerable voltage in order that accuracy and stability may be secured. In addition, the brushes of the generator have to be carefully adjusted so as to eliminate transformer action. The following are a few particulars of one form of generator which has yielded good results: The armature is of the two-pole type, and is wound with 100 sections, each having 50 turns and an area for magnetic flux of 130 square cms. The commutator has 100 parts. The field coil is built up of copper strip 2 in. deep by $\frac{1}{32}$ in. thick, and has four sections connected to blocks in such wise that they can be used in parallel or series or parallel-series groupings. The number of turns per section is 10. The speed of rotation is 3,600 revs. per min., and is registered by a Hartmann & Braun speed counter, capable of detecting a variation in speed of 0·3 per cent. The curve of voltage between the generator brushes was determined for various positions of a rotating contact-maker fixed to the shaft of the alternator and compared with the curve of current in the field coil. The agreement was as close as could be demonstrated by the method of test.

The electrometer in its first form resembled Lord Kelvin's quadrant electrometer. The suspension was made of phosphor-bronze strip, and the vanes, two in number, were each $10\frac{3}{4}$ in. long by about 4 in. broad at their widest part. In a later form of the instrument the quadrant pairs are the moving system, and are suspended by phosphor-bronze strip between two fixed sectors, which are heavily insulated and capable of withstanding several fold the normal voltage of the instrument. The suspended quadrants are $9\frac{1}{2}$ in. in diameter, and are $1\frac{3}{4}$ in. from the fixed sectors, the instrument being

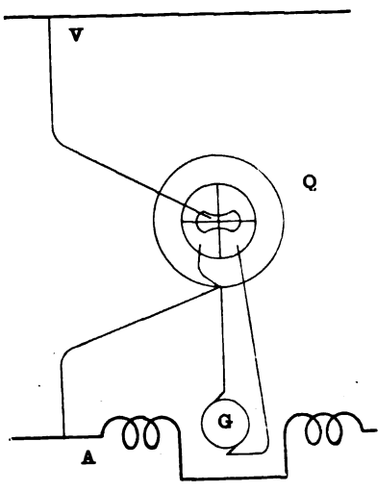

FIG. 2.

designed for 15,000 volts. The instrument obeys the straight line law, is accurate on low power factor and has a sensibility such that on a scale 50 in. distant from the mirror, the killowatts per millimetre deflection are 1·82 when the generator field coils are four in series.

A further piece of apparatus, depending upon the charging of condensers in parallel and the placing of them in series, has been used for multiplying a small voltage produced by the passage of the main's current through a low resistance shunt.

A NEW SECONDARY CELL.*

BY D. J. BLOCK.

It is a well-known fact that on electrolysing the halogen salts of zinc, cadmium, cobalt, nickel, iron, tin or copper, the metal is deposited at the cathode and the halogen at the anode, but no attempt appears ever to have been made to recombine these elements so as to recover, as kinetic energy, the potentiality degraded by their electrolytic dissociation. The cell herein described is designed to retain or store the halogen so eliminated within the body of the anode and to secure such an ionic emplacement as will, by recombination, return approximately all the energy used in effecting dissociation.

The cell (*see* diagram) consists essentially of a zinc containing jar "A," which serves as the cathode element; a paste, "B," of ground or granular carbon impregnated with an aqueous solution of ferric hydroxide, zinc bromide and zinc chloride; and an anode of porous carbon, "C," surrounded with cloth asbestos, the purpose being to form a carbonaceous wick to support the bromine against gravity, and to condense the chlorine. This is accomplished by using, in addition to the asbestos cloth, a specially prepared form of charcoal, which is able to retain within its pores about 200 times its volume (three-quarters of its weight) of chlorine gas and a larger quantity of liquid bromine. The mechanism of reaction is as follows:—

Anode.

$$15ZnCl_2 + 3ZnBr_2 + 18H_2O + 12Fe(OH)_3 =$$

On Charging

$$18Zn + 12Fe(OH)_3 + 30HCl + 6BrHO_3$$

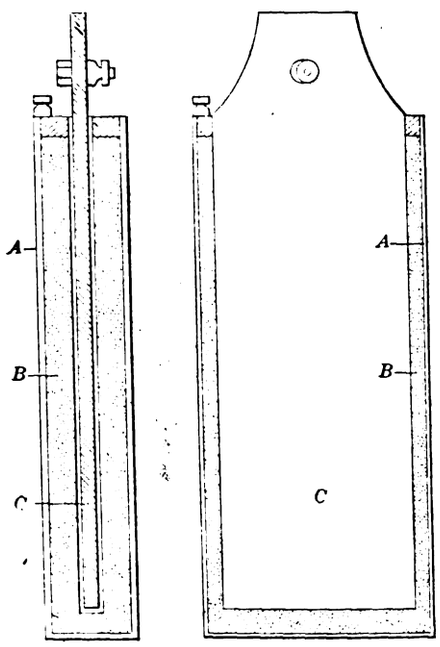
The ferric hydroxide then neutralises the bromic and hydrochloric acids, giving ferric bromate and ferric chloride, thus:

$$30HCl + 6BrHO_3 + 12Fe(OH)_3 =$$

On Discharging

$$10FeCl_3 + 2Fe(BrO_3)_3 + 36H_2O.$$

The ferric bromate and the ferric chloride are potentially equal to bromic and hydrochloric acids. The six molecules of bromic acid lose their 18 atoms of oxygen to the 18 atoms of zinc; the bromic acid becomes hydrobromic acid, and the zinc oxide so produced dissolves in the hydrobromic and hydrochloric acids hydrolysed from



SECTIONS OF CELL.

their ferric salts, giving back the original chloride and bromide of zinc, without the evolution of hydrogen and polarisation, thus:

$$18Zn + 10FeCl_3 + 2Fe(BrO_3)_3 + 36H_2O =$$
$$15ZnCl_2 + 3ZnBr_2 + 12Fe(OH)_3 + 18H_2O.$$

Some ferric chloride, not shown in the equation, is present to hold up the hydroxide and, in addition, a suitable substance is used to increase the conductivity of the electrolyte; neither of these interfere with the mechanism of electrolytic or chemical action, and consequently are omitted from the equation.

The first of these cells constructed had a cathode of iron and an anode of carbon surrounded with a paste of the haloid salts of iron. This developed surprising voltage irregularities, both on charging and discharging, due to the fact that the halogen salts of iron exist in two modifications. This is true also of tin and copper, so that in the selection of a cathode material for a second cell we were limited to lead, cobalt, nickel, cadmium or zinc. Of these, the latter was selected as best adapted to the purpose, although a cobalt cell is now under construction.

The zinc-carbon type of brom-chlorine accumulator cannot yet be considered a commercial success, the first of these cells having attained an electrical efficiency of but 28 per cent. This was largely due to high internal resistance, and has, in a measure, been overcome. One of the newer of these cells, now under test, shows an efficiency of nearly 52 per cent. However, this type of secondary cell has many desirable features, the chief of which, perhaps, is its light weight, the cell herein described developing one actual horse-power-hour per 15 lb. weight; the cost is low; no loss of energy due to hydrogen formation at the cathode can occur; and obviously, because of the neutral or weakly basic character of the electrolyte, the charged cell may be placed aside for long periods without loss of energy due to the corrosive action of the electrolyte.

* Abstract of a Paper read before the American Electrochemical Society.

THE DUNSTON POWER STATION OF THE NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO.

Introduction.

In an article in THE ELECTRICIAN for January 13th, 1911, we described what the Newcastle Electric Supply Co. were doing as regards providing collieries on the North-east Coast with electrical energy. The activities of the Company are not, however, limited to collieries; in fact, they have upon their mains such varied consumers as shipyards, engineering and chemical works, as well as lighting, heating and cooking; the total connections, in fact, amount to some 150,000 H.P., a load which is spread over an area of 1,000 square miles, extending from Blyth in the north to Ginsboro' in the south, and westward from the coast to Consett and Bankfoot.

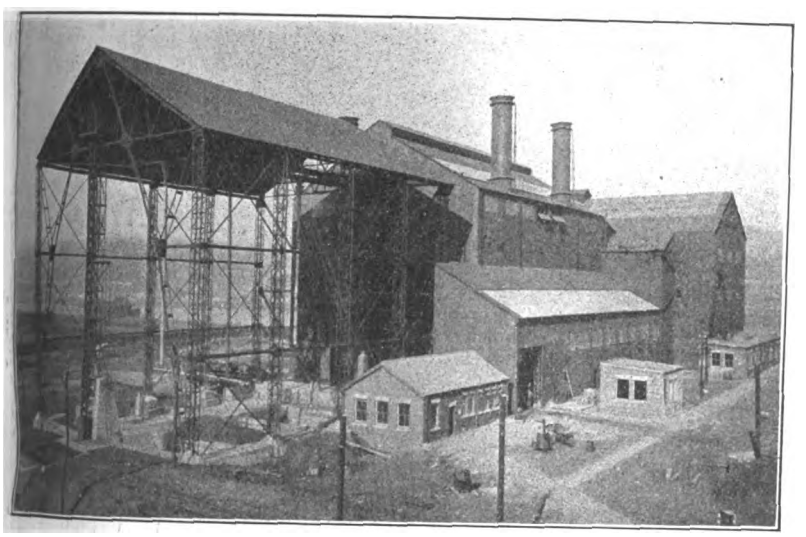

FIG. 1.—VIEW OF DUNSTON POWER STATION, WITH COAL STORE.

This enormous area is, of course, not supplied from one, but many stations, the principal of which is the well-known steam-driven plant at Carville-on-Tyne. Others, employing waste heat as a source of energy, are to be found at Blaydon, Newport, Weardale, Bankfoot and Bowden Close. It recently became necessary, however, to erect another steam-driven station, and a site at Dunston, on the south bank of the Tyne, was chosen. This site is about three miles from the high-level bridge at Newcastle and about eight from Carville. There is plenty of land at present available near by, and, as a result, works which are likely to require a supply of electric power are being attracted to the district. Dunston is also convenient geographically, being at the opposite end of the network from Carville. The Company's cables, which run down each side of the Tyne, are connected at Carville by a tunnel under the river and higher up the river at the High Level and King Edward Bridges. Further, the site is exactly opposite the Elswick works of Messrs. Armstrong, Whitworth & Co. Coal supplies, too, can be obtained with equal facilities from both the Northumbrian and Durham coalfields, and condensing water is plentifully present in the river.

General Arrangement.

The design of the station provides eventually, as will be seen from the diagrams herewith, for three boiler houses each with its own coal store, which will extend along the longer side of the engine room. The buildings are steel framed structures, and a minimum of brick-work has been used in their construction. All the main switchgear is placed in an entirely separate building some 150 yards away from the engine house. This arrangement, it is considered by the designers, has allowed not only a very light and convenient engine room to be erected, but what is more important, it has allowed the cables to be taken into and out of both sides of the switch house, thus facilitating the arrangements made for future extensions.

The "unit" system has been used throughout the Dunston station. That is, there is one coal store, one boiler house and one set of coal-handling plant for every eight boilers; and one boiler house containing eight boilers to every two turbo-alternator units. Further, there is one main steam pipe, one feed-water pipe, one hot-well feed pump, and one set of ash-conveying plant for each set of four boilers. There is one economiser and one coal shoot for every boiler; and each turbo-alternator has its own set of engine-room and boiler-house auxiliaries, the motors driving these auxiliaries being supplied with power from a separate transformer whose primary is fed from the particular unit concerned. It would appear that sub-

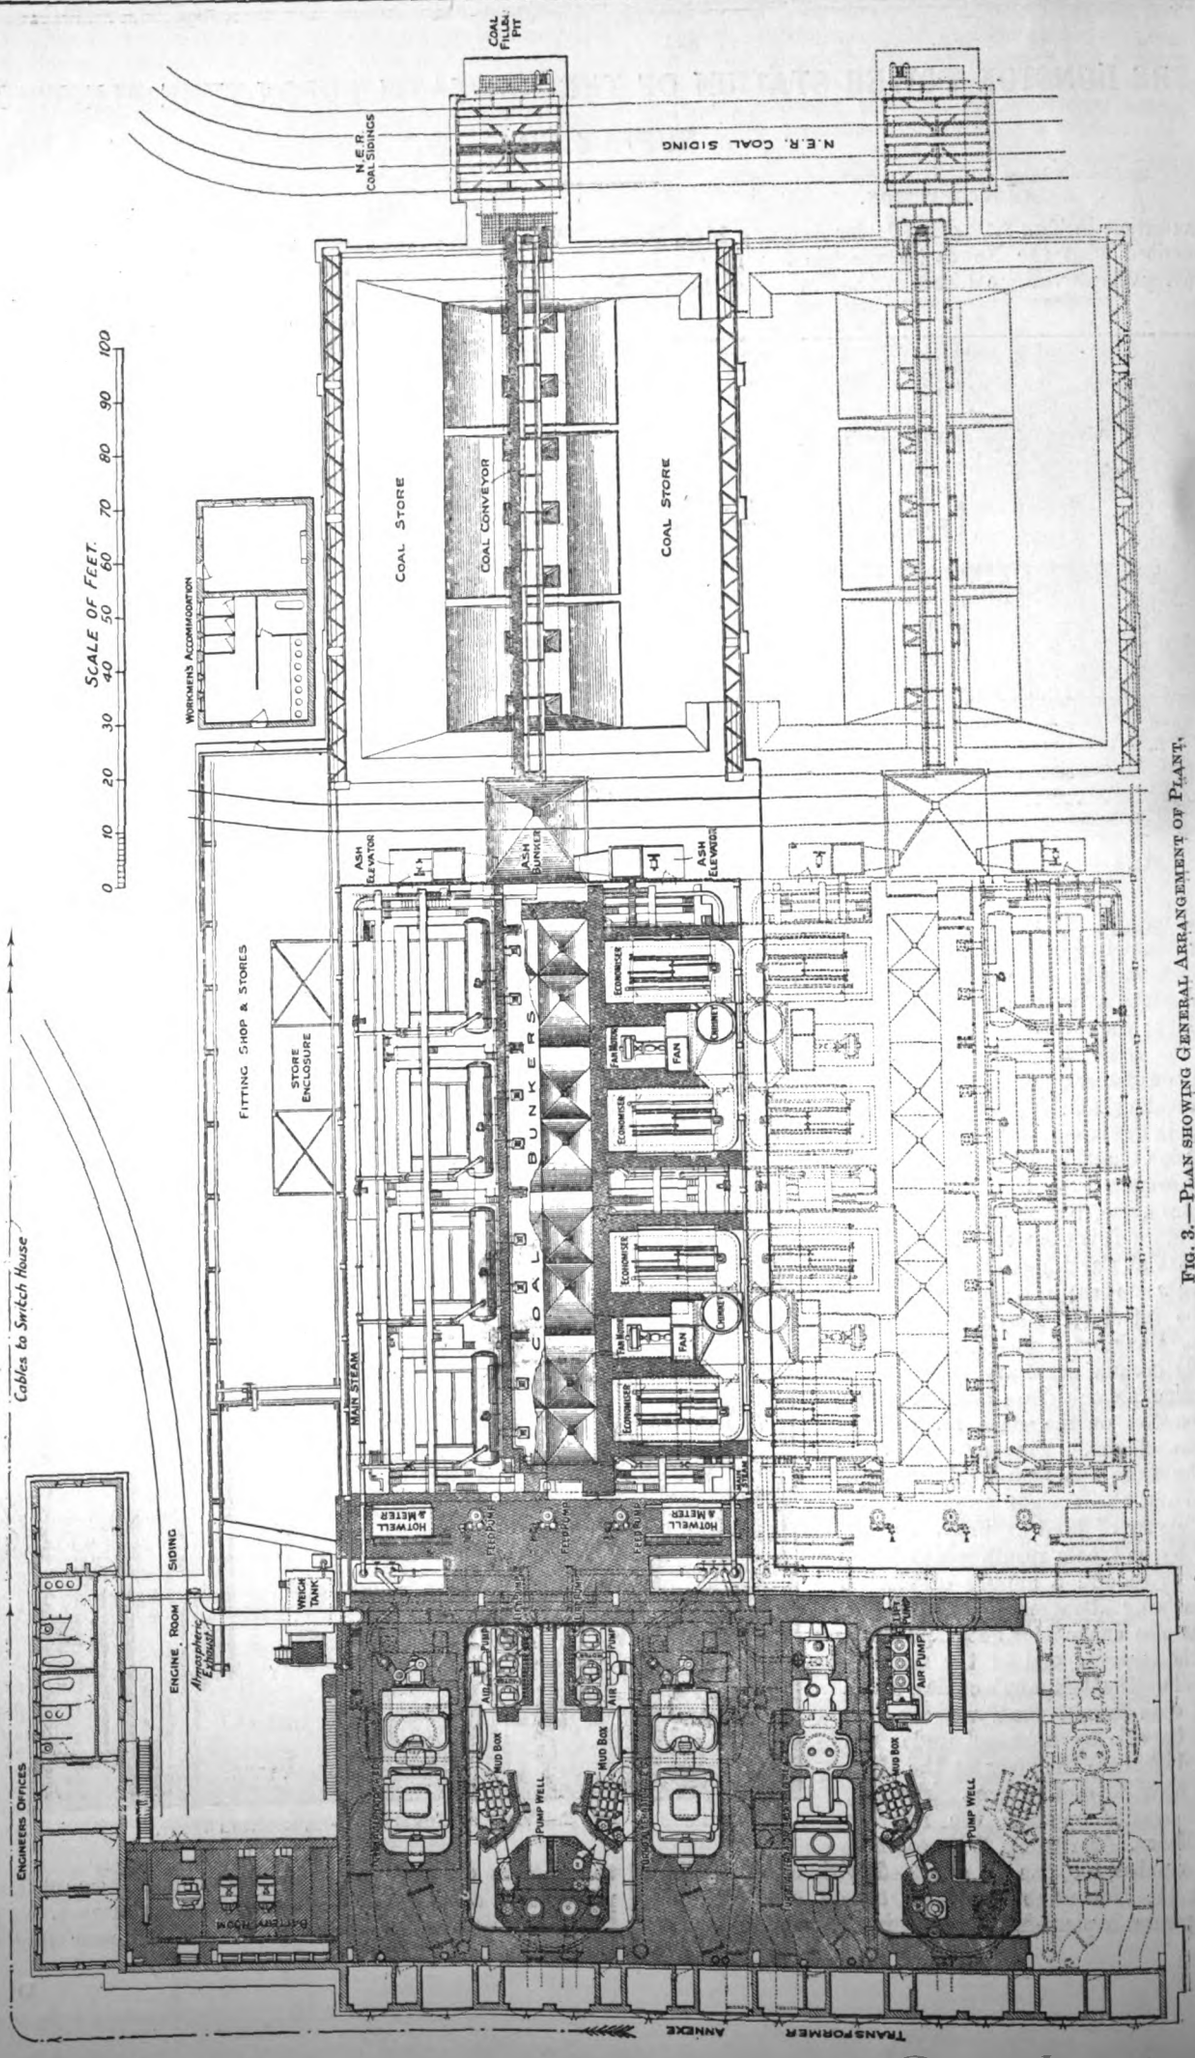

FIG. 3.—PLAN SHOWING GENERAL ARRANGEMENT OF PLANT.

Digitized by Google

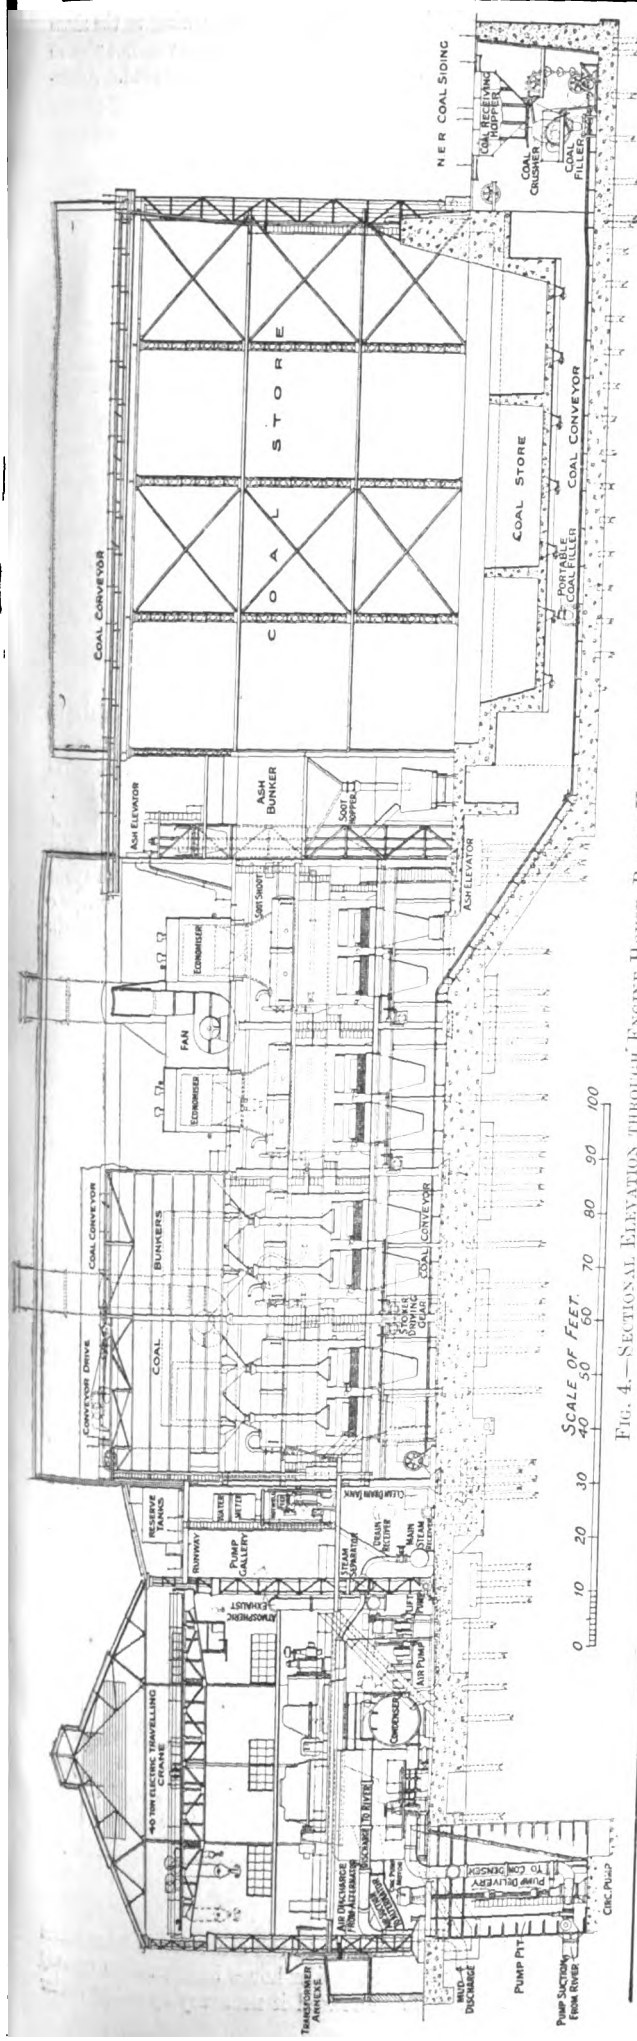

FIG. 4.—SECTIONAL ELEVATION THROUGH ENGINE HOUSE, BOILER HOUSE AND COAL STORE.

division could go no further. The design of the Dunston power station has, further, in general been carried out according to the ideas formulated by Messrs. C. H. Merz and W. McLellan, in their Paper on "Power Station Design," which was read before the Institution of Electrical Engineers in 1904 (*see* THE ELECTRICIAN, April 29th, 1904).

SYSTEM OF SUPPLY.

The station generates three-phase current at a pressure of 5,750 volts and a frequency of 50. It is a steam-driven station, the steam pressure used being 200 lb., whilst superheat is employed, so that the working temperature is practically 570°F. Dunston station has been designed on a 50,000 kw. basis, that is, six units with a nominal output of 8,000 kw. will eventually be installed, though their maximum capacity will be 10,000 kw. Four units have been provided for as a commencement, and three of these are already installed. If further extensions above 50,000 kw. are necessary a new station will have to be built, and adjacent land has been taken up for this purpose.

As mentioned above, the "unit" system has been followed throughout. There will be a separate boiler house for every two generating units, that is to say, there will be eventually three boiler houses, although only one of these has so far been completed. The boiler house taken as a unit will contain eight boilers, four on each side of the central gangway, but the design is such that three of these boilers will be capable of supplying sufficient steam for driving a generator unit at full load continuously.

BOILER HOUSE.

The boiler house is arranged with several floors, as will be noticed in Fig. 4. It includes first a very roomy basement, 18 ft. 6 in. high. Into this basement ashes are delivered from the boilers, and here, therefore, are placed ash bunkers, one for each boiler, and of capacity sufficient for storing the ashes obtained in 14 hours' working of the station at full load. This means that at ordinary loads ashes need only be cleared once in every 24 hours. In connection with this scheme, arrangements have been made so that the ashes need be handled as little as possible. They are removed in trucks from the ash-house bunkers. These trucks are then raised by electric lifts to the ground floor level. Next they are dumped into a large overhead bunker, which is used for ashes alone, and one of which is provided for each boiler house. This overhead bunker is of such capacity that 2 or 3 tons of ashes can be stored in it. A railway siding runs underneath it so that ashes may be taken away by rail or removed in trucks to the quayside and there dumped into barges. A view of the station with its coal store is given in Fig. 1.

Above the ash-house, on the next floor, are placed the boilers themselves, these being, as mentioned above, grouped in pairs. Each boiler, however, has its own superheater and economiser, though, as regards the fans and chimneys, the unit is again a pair of boilers. The fan and chimney for each double unit are placed directly over the corresponding boilers and the economisers are placed over the boilers in pairs.

Automatic operation is used for supplying the necessary coal to these boilers. Over the centre of each boiler house are arranged enormous coal bunkers which are capable of holding a week's supply of coal, assuming the whole station to be running at an average of half load during that period.

As regards the delivery of coal, it is first dumped into receiving hoppers by means of bottom dumping trucks. Next it is, if necessary, passed through a coal-breaker, and it is then lifted by means of a conveyor to the hoppers. This conveyor is capable of dealing with 40 tons of coal per hour and is electrically driven.

The boilers are fed by means of Babcock & Wilcox chain-grate stokers, the grate area per boiler being 168 sq. ft. The economisers are placed in a separate house above the boilers, where also are to be found the fans and fan motors.

The boiler house is equipped with a series of galleries at different heights and running the whole length of the house, so that the water level can be ascertained and other duties

Digitized by Google

performed with ease, while access is obtained to the economisers and fan motors. Each mechanical stoker and each economiser scraper is driven by a separate enclosed electric motor. The whole boiler installation is designed so that when working at maximum economy the temperature of the chimney gases does not exceed 300°F.

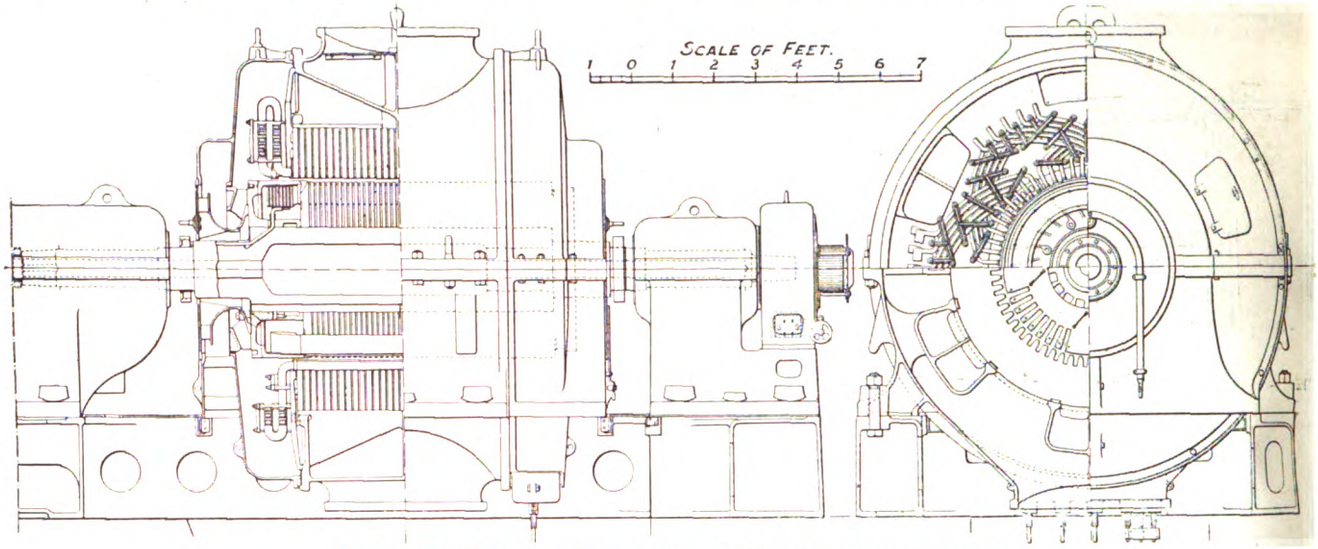

FIG. 5.—PART SECTIONAL ELEVATIONS OF 7,000 KW. TURBO-ALTERNATOR.

siding right through the boiler houses, but owing to the shape of the land on which the station was built this was not possible at Dunston, so that a conveyor had to be installed. Advantage has, however, been taken of this necessity to instal at the end of the boiler house a large store capable of accommodating sufficient coal to operate the station for three weeks. This store is additional to any coal there may be in the bunkers. When coal is delivered into this store it is supplied from the same conveyor which feeds the boiler house. This is effected as follows: Underneath the store is a tunnel; in this tunnel are placed filling hoppers which feed on to the conveyor so that the one conveyor either delivers coal direct to the boiler-

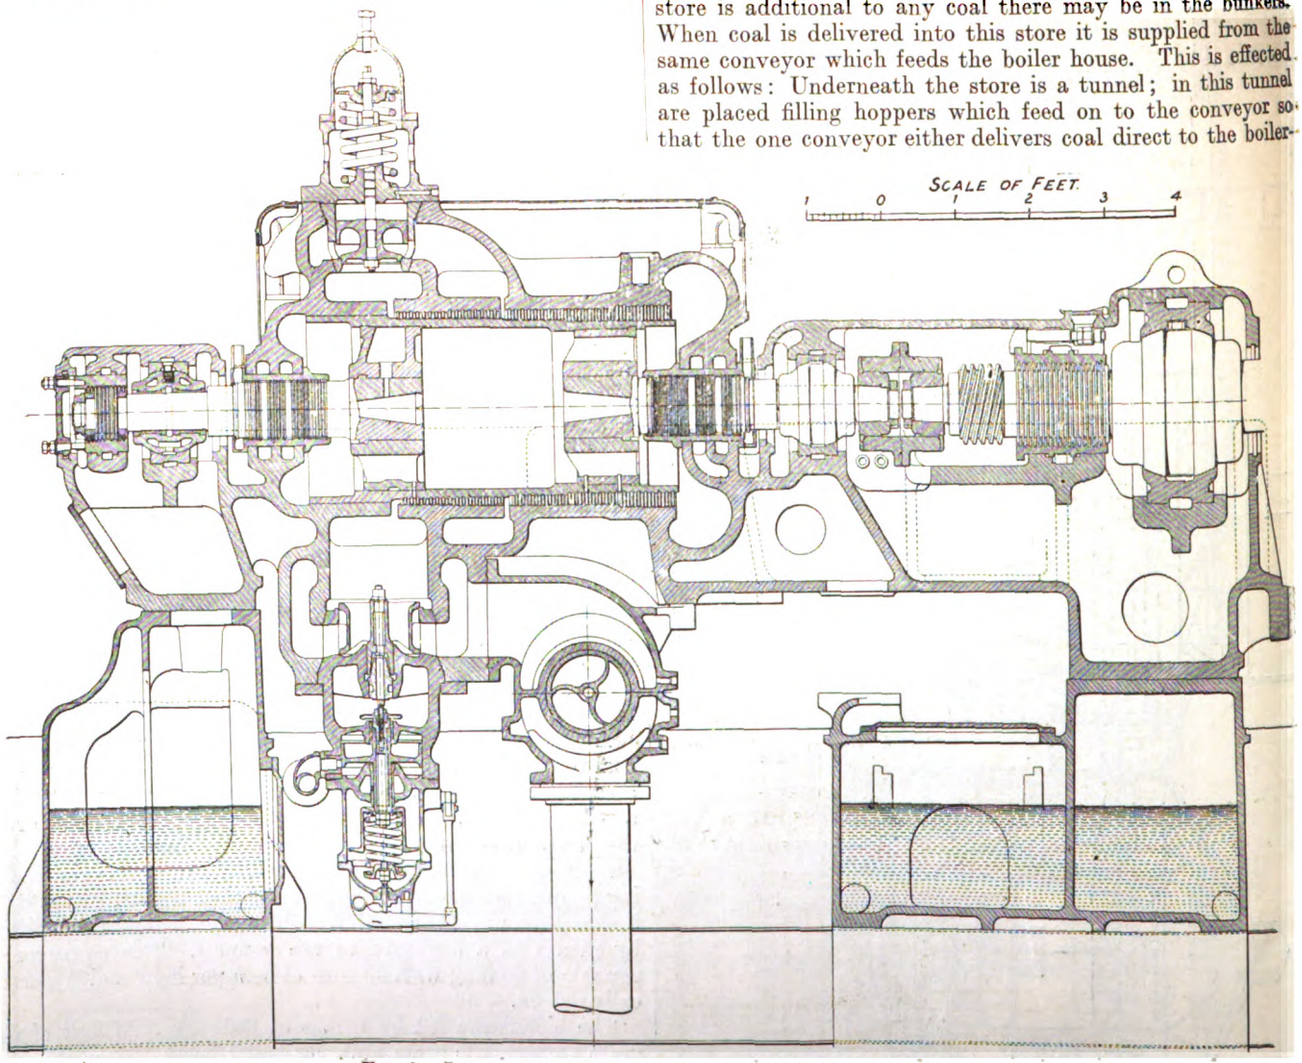

FIG. 6.—LONGITUDINAL SECTION THROUGH 7,000 KW. TURBINE.

As regards the design of the boiler house at Dunston, it may be interesting to point out the differences that exist between it and Carville. At Carville it was possible to run the railway house bunkers or delivers it to the coal store, or takes it from the coal store up to the boiler-house bunkers. The capacity of this store can be increased if necessary by adding further

Digitized by Google

floors to the building. This will enable large quantities of coal to be kept in one building without any risk of spontaneous firing taking place owing to the fact that the store will ultimately be divided up by means of floors into layers not exceeding 12 ft. deep.

station is that adjacent to the siding is a large space on the ground floor level on to which the parts of any turbine alternator that has broken down can be dumped for repairs or overhauling. This space is traversed by a small overhead crane which also feeds the repair shop near by. This shop is in direct

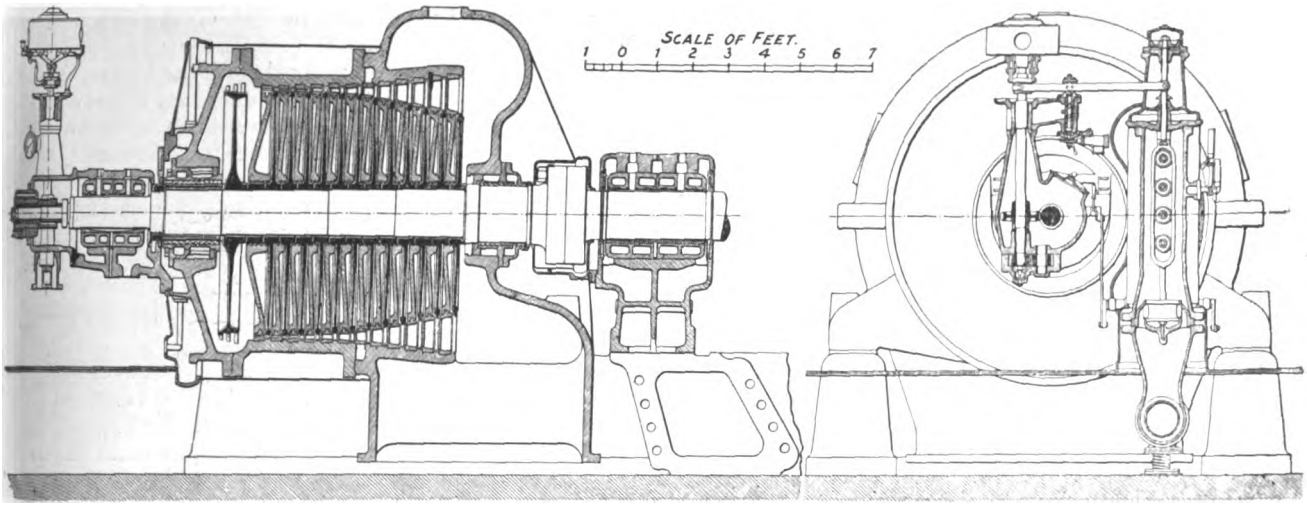

FIG. 7.—SECTIONAL ELEVATIONS OF 8,000 KW. TURBINE.

TURBINE ROOM.

The present turbine room, of which a view is given in Fig. 2, has been built to accommodate four turbines, each with a capacity of 8,000 kw. The railway siding runs right into the

communication with the offices, mess rooms, and lavatories for the engineers and staff at the station.

In designing the turbine room every effort has been made to obtain as compact an arrangement of the machines as possible.

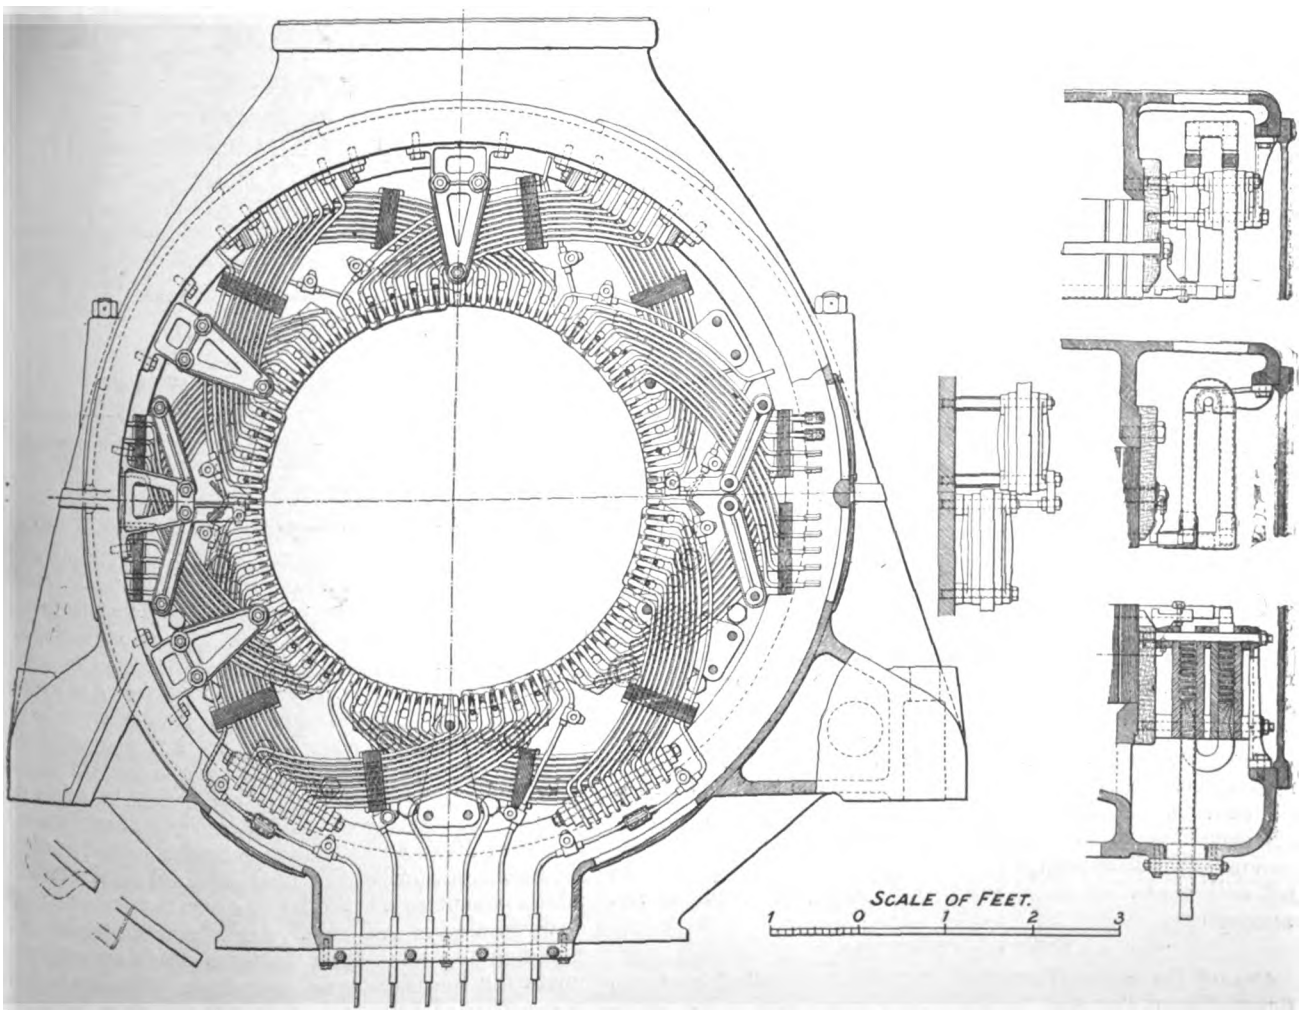

FIG. 8.—END ELEVATION AND DETAILS SHOWING END CONNECTIONS OF 8,000 KW. ALTERNATOR.

room and over it is placed an electrically-operated overhead travelling crane which can deal with loads not exceeding 40 tons. A point worth noticing in the design of this part of the

Such compactness not only facilitates the operation of the station, but also allows everything, including the auxiliary machinery, to be got at by the overhead crane. This accessibility

Digitized by Google

of plant applies even to circulating water sumps, of which there will eventually be three, or one for every two units. These sumps are placed in the engine room, midway between each pair of turbines, and go down to a depth of some 70 ft. below the engine room level. In each sump are placed two electrically-driven centrifugal pumps, one for each generating unit, these pumps being so arranged that they are "drowned" at all states of the tide. The pump shafts are arranged vertically, and the motors driving them are placed on the engine-room floor level. The suction of each of these pumps is in direct communication with the intake sumps at the river by means of a 24 in. cast-iron pipe. The entrances to these sumps are provided with suitable gratings to prevent the introduction of foreign matter to the circulating system and in order to avoid blocking the condenser tubes. As a further precaution, self-cleaning screens are provided for each condenser. One salt-water pump is also installed in each sump for supplying water for general cleaning purposes.

A glance at the illustration showing the engine room will be sufficient to indicate that utility has throughout been the key-note of the design. Continental engineers usually erect a station with tile or brick floors all round the turbine. This is all very well, but it requires additional work to keep them clean, and, besides, renders the auxiliary units more or less

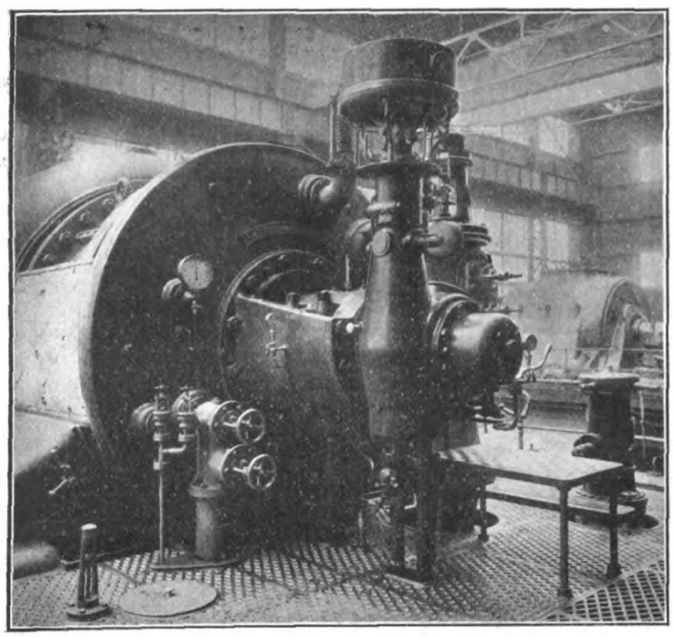

FIG. 9.—GOVERNOR GEAR OF 8,000 KW. TURBINE.

inaccessible. At Dunston, on the other hand, access to the turbine is secured by means of open cast-iron floor plates and galleries extending over the basement of the station at the turbine lever. Roof lights and large windows running the whole height of the engine room provide ample illumination round the main sets, while the basement is also in this way sufficiently illuminated.

On the same level as the turbines and between them and the boiler house are placed the feed pumps, the hot wells, the water meters, &c. These will all be operated by the turbine drivers. Beneath the pump gallery are various small pumps, and on the same level as the condensers are the electrically-driven air pumps. The feed pumps exhausts can either be taken to the hot-well tanks or to the water softener, or direct to the atmosphere.

TURBO-ALTERNATORS.

One of the turbo-alternators at present installed is of the Brown-Boveri-Parsons two-cylinder type, and the other two are of the A.E.G. impulse type. The alternators have been designed to stand the severest short circuits which are likely to come upon them in practice. Sections of the 7,000 kw. set are given in Figs. 5 and 6 herewith, and of the 8,000 kw. A.E.G. sets in Figs. 7 and 8, the governor gear of the latter sets being shown in Figs. 9 and 10.

The exciters for each alternator set are arranged on the ends of the alternator shaft. Special mention may be made of the ventilating arrangements which are so necessary for alternators running at a high speed. The arrangement adopted at Dunston has been to instal fans which draw air in from outside the building, a constant supply of cold air being thus obtained. At Dunston the fans are fixed to the alternators themselves, the air being drawn in through ducts and filtered on the way. The unit system has been used in this part of the plant too, there being a special duct and fan for each alternator. Further, the outlet air ducts are so arranged that the hot air can either be discharged direct to the outside of the building or into the engine room, so that the temperature of the latter can be controlled at will.

AUXILIARIES.

For driving the station auxiliaries three-phase current at a pressure of 440 volts and a frequency of 50 is used throughout. The auxiliaries belonging to each alternator are fed from a 500 kw. transformer which is installed in a fire-proof chamber opposite the alternator concerned. The primary of this transformer is directly connected through switches to the main

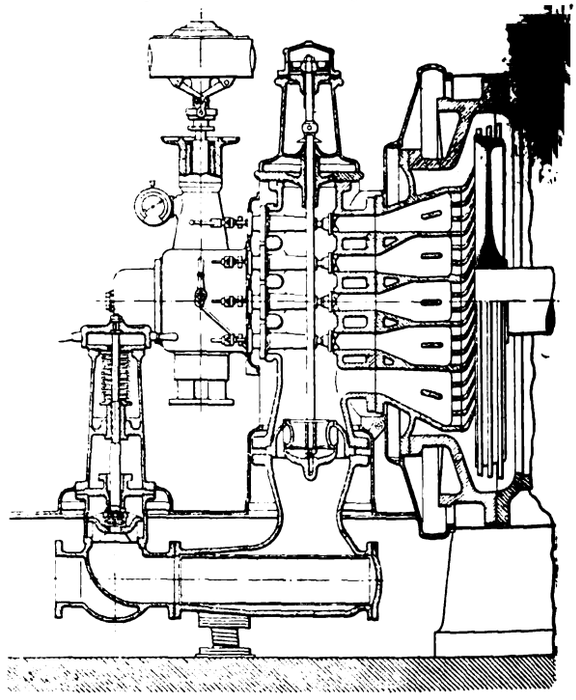

FIG. 10.—GOVERNOR GEAR OF 8,000 KW. TURBINE.

terminals of its own alternator, so that the auxiliaries are supplied even if the main alternator switch is open. In addition to these unit auxiliaries provision is made for the feeding of other motors in the station from a set of 'bus bars which are supplied from the main 'bus bars in the switch house through two 500 kw. transformers. These supply a set of low-tension 'bus bars which are placed on an enclosed gallery in the engine room. Although these 'bus bars are used in general for supplying the motor generators, the rotary converter and the isolated motors throughout the works, they can also be used for giving a supply at starting to the exciter circuit or auxiliaries of any one unit. Two 50 kw. motor generators are used for supplying direct current for lighting the station and charging the battery, which is kept as a stand-by to ensure that current for lighting shall be always available. A smaller motor generator is used for charging two other batteries which are employed for operating the high-tension switchgear. The large battery has a capacity of 1,000 amperes at the one-hour discharge rate and the two smaller batteries a capacity of 100 amperes at the same rate of discharge. The rotary converter is used for supplying power to the electric locomotives which work in the station yard.

(To be concluded.)

SIEMENS MERCURY CONTACT TREADLE FOR RAILWAY SIGNALLING.

The recent railway disasters have drawn attention to the desirability of an extension of automatic signalling on railways, so that the following particulars of the most recent form of the mercury contact treadle of Messrs. Siemens Bros. & Co. should prove of interest. The object of this apparatus is automatically to close or open an electrical circuit by the passage of a train at a given point on a railway line. This circuit may be utilised for a variety of train signalling purposes.

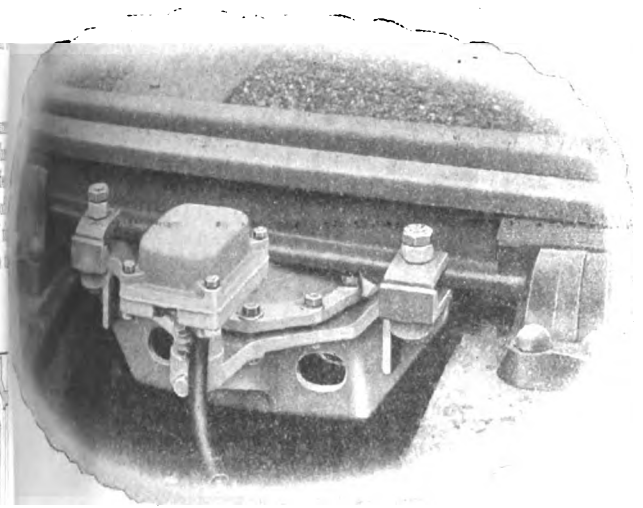

FIG. 1.—TREADLE ATTACHED TO RAIL.

The Siemens mercury contact treadle has already proved its practical value in a number of installations. The design of the apparatus obviates the many difficulties experienced with treadles in which a more or less complicated system of levers is used to magnify the deflection of the rail; and the apparatus also possesses the great advantage that, if proper care be taken when first erecting, it remains quite unaffected by changes of temperature. It is entirely self-contained and both dust and water tight.

Owing to the increasing use of electricity for power and traction purposes, it has been found desirable to make treadles in which the circuit, when open, shall be entirely free from earth. The Siemens types are now all fitted with two insulated contacts to meet this condition. The contacts are of several forms, all interchangeable, and are arranged to meet various conditions that may arise, viz., (1) To give one long contact during the passage of the whole of a train. (2) To give intermittent contacts during the passage of a train. (3) To maintain a normally closed circuit which is opened by a train.

The apparatus, which is illustrated in Fig. 1, is actuated by the deflection of the rail between two chairs due to a passing wheel, the slight movement obtained being transferred to the electrical contact in the manner described below. Fig. 3 is a cross section of the apparatus bolted to a rail. In this illustration the apparatus is shown fitted with the first-mentioned type of contact.

The treadle (Fig. 3) is in the form of a strong iron casting, A, which, by means of the clamps, B, B, is firmly bolted to the bottom flange of the rail. In the centre is a circular shallow recess, C. A thin steel diaphragm, D, is clamped between the rim of the recess and the cover, E, by the bolts. In the centre of the cover, E, are the steel plunger, F, and plate, G, resting on the diaphragm, D. An india-rubber ring, H, laid in a groove in the cover, E, surrounding the plunger, F, makes an elastic joint which is both water and dust proof between the treadle and under surface of rail. The passages, J and L, connect the recess, C, with the contact device inserted into the mercury chamber, K. The contact pins, N, are supported by, but insulated from, the cover, O, of the contact box.

The contact device consists of a cast-iron box having valves and passages, the action being similar to that of a pump. According to the type of contact given, mercury is either forced into or withdrawn from the contact box. It should be noted that the mercury is in such a state of circulation during the time that the diaphragm, D, is in movement that any scum that should happen to form on its surface will not detrimentally affect the contact, the latter being always made with perfectly clean mercury. The spaces in which the mercury is contained and operates are hermetically sealed, thereby preventing oxidation or accidental loss of the mercury.

In consequence of the different levels of the mercury in the space, K, and recess, C, the diaphragm, D, and with it the plunger, F, are always pressed firmly upwards against the foot of the rail with a pressure of about 150 lb. As soon as the rail experiences a slight deflection between the points of attachment of the treadle, due to the weight of a moving vehicle, the plunger, F, communicates the deflections, however slight, to the diaphragm, D, and thus displaces the

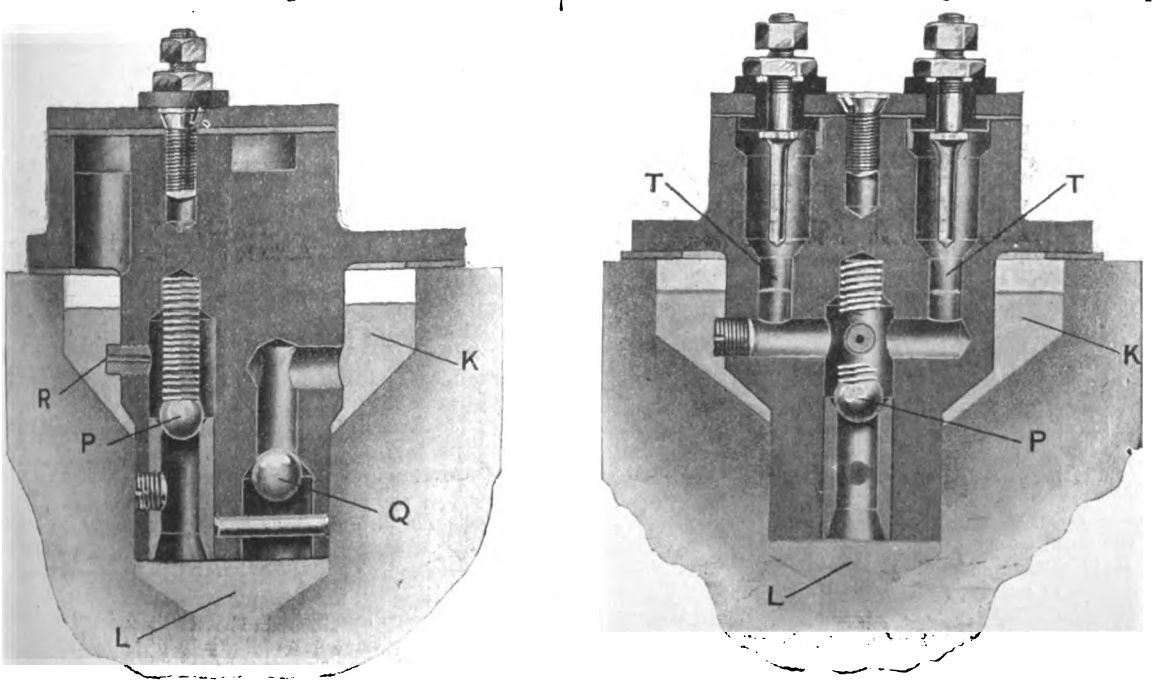

FIG. 2.—CROSS SECTIONS OF TYPE "D.P.C." CONTACT.

The treadle is supported solely from the rail between two contiguous sleepers, is quite independent of the ballast, and, being clamped to the bottom flange of the rail, no holes are required in the latter. Its range of sensitiveness is such that with the recent improvements it will work equally well on the lightest or the heaviest rails with any description of rolling stock travelling at slow or fast speeds.

mercury confined in the recess below. As the ratio between the area of the recess to that of the contact chambers is about 1,500 to 1, the amount of mercury displaced ensures good electrical contact being established.

The action of the first-mentioned type of contact, that for giving one long continuous contact during the passage of a train, is as follows (*see* Fig. 2):—The normal level of the mercury is about ¼ in. below

Digitized by Google

the contact pins, but upon the deflection of the diaphragm, D, taking place, the mercury is displaced and rises via the delivery ball-valve, P, through the horizontal hole and thence into the contact chambers, T. In order to ensure that a continuous contact is established, another or suction ball-valve, Q, is provided, which, by reason of its tendency to float in the mercury, automatically seals itself on its face in an upward direction.

As soon as the reflex action of the diaphragm takes place, *i.e.*, as soon as a wheel has passed, the passage, L, is again filled with mercury by reason of the mercury passing the suction valve, Q, from the reservoir and replenishing quickly this part, to the extent of the amount of mercury passed through the delivery valve, P. Thus, whether the traffic consists of light or heavy stock, travelling either slowly or quickly, the treadle contact responds immediately and gives one prolonged contact.

Owing to the great displacement of the mercury, provision has to to be made for an overflow into the reservoir, K. This is arranged by making contact chambers at the top open into an annular channel, which is, in turn, connected by a hole leading into the reservoir, K. In actual practice it is found that with ordinary traffic this overflow always takes place, and, therefore, the contact pins are fully immersed

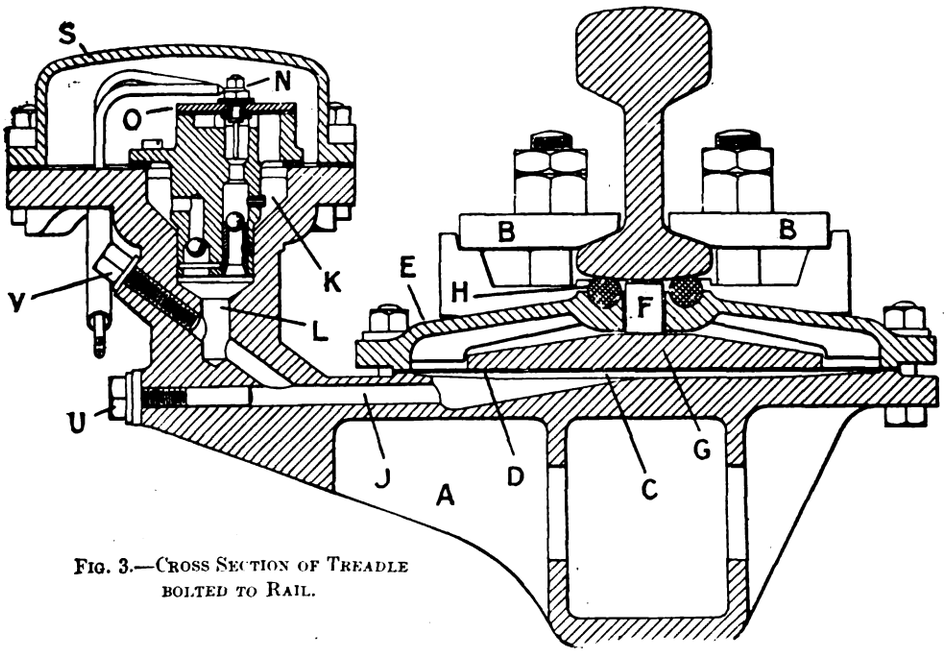

FIG. 3.—CROSS SECTION OF TREADLE BOLTED TO RAIL.

in the mercury. The mercury remaining in the contact chambers, T, maintains the circuit between the passage of the wheels, as it can only escape into the chamber, K, through the small hole in screw, R. The size of this hole can be varied so as to maintain a contact for 1 to 8 seconds after the last wheel has passed over the treadle.

Particulars of the operation of the other two forms of contact mentioned are contained in a pamphlet recently issued by Messrs. Siemens Bros. & Co.

CONFERENCE ON EDUCATION AND TRAINING OF ENGINEERS, 1911.

(*Continued from page 462.*)

Wednesday, June 28th (continued).

SECTIONS I (GENERAL EDUCATION) AND II (SCIENTIFIC TRAINING).

Prof. S. P. THOMPSON next read his Paper, an abstract of which we give below :—

ON THE EXTENT TO WHICH MATHEMATICAL AND SCIENTIFIC SUBJECTS SHOULD SHARE WITH OTHER SUBJECTS OF LITERATE EDUCATION THE ATTENTION OF SCHOOLBOYS WHO INTEND TO ENTER LATER THE ENGINEERING PROFESSION.

BY PROF. S. P. THOMPSON, D.SC., F.R.S.

Complaint must be made of the lack of definite aim in the teaching of secondary schools. A few boys are prepared for scholarships or for Sandhurst or Woolwich ; but is there in all England a single school which has a definite educational aim towards which it focusses the training for as many as 50 per cent. of its scholars ? In Germany matters are very different. There are two examinations which every boy in the secondary school must attempt, and the immense advantages of this reasoned organisation cannot be overstated. Again, there is only matriculation here ; each university wastes its energies over these examinations, and almost all the professional bodies have examinations of their own in addition.

With one of the recommendations made by the Institution of Civil Engineers' Committee, presided over by Sir Wm. White, viz., that a general knowledge of elementary physics and chemistry or natural philosophy is preferable to the pursuit in detail of some particular department in science, the writer finds himself in most hearty agreement. Many mistaken notions are abroad as to science-teaching in schools. Excellent as was the notion to give science a place in the school curriculum, the pressure put upon schoolmasters to introduce science subjects has had some strange results. The writer knows of one school where the "chemistry" taught twice a week consisted in making the boys "get up" a chapter from Roscoe's Elementary Lessons without their ever making, or even being shown, a simple chemical experiment. On the other hand, the heuristic method—a method used in due place by every good teacher since the days of Socrates—has been absurdly pressed, even to the detriment of progress. There can scarcely be anything more dreary than a forced heuristic lesson by a teacher who has neither inspiration nor sympathy. For at school the first object of science-teaching should be to evoke interest, not to impart the facts or data of science, still less systematise their re-discovery. All that has its place later. The fossilisation of science-teaching is indeed the thing now most to be feared. Not until a boy is 15 or 16, and is approaching the stage of matriculation, should science be allowed to degenerate into a grind. The stimulus of the approaching examination will carry him through the drudgery: and the amount of drudgery will be felt to be small because of the interest already acquired in the subject itself. It can hardly be too strongly urged that any specialisation in scientific subjects before that stage has been passed is essentially out of place and harmful.

Reverting to mathematics, it may be remarked that a great change has already come over mathematical teaching during the last ten years. This is partly due to the general discontent with the bad methods in vogue, partly to the strenuous crusade undertaken by Prof. Perry and other reformers. One difficulty which has been experienced by masters of progressive tendencies in the promotion of sensible reforms has been the stupidity of inspectors who have not yet grasped the importance of them. The benumbing influence of the older Cambridge traditions is also felt. Bad teaching is responsible more than anything else for distaste for mathematics. A really capable teacher will make his boys enthusiastic over matters that in the hands of others are deadly dull. A class can be made—the writer has seen it happen with students of 17 or 18—wildly excited over Bessel's functions : and a class of young boys has been known to sit up late in the pursuit of finding out all the prime numbers that occur between 1,000 and 2,000. If mathematical teaching is dull it is the fault of the teacher.

Of all the changes that have come over the teaching of mathematics, the greatest is the almost complete disappearance of Euclid. Theoretical geometry is now taught on other lines. But the writer is not sure whether the loss is not greater than the gain. Euclid in the hands of an uninspired teacher was probably the worst possible way of teaching geometry ; the worst, because it was too often attempted with boys who had not previously learned any geometrical drawing, and had, therefore, no conception as to what it was all about, and because the way in which the subject was treated was often merely to learn by rote something that neither the teacher nor the taught really understood or valued. But the teaching of Euclid was in one respect absolutely invaluable. If it is approached rightly after practice in geometrical drawing which familiarises the learner with the concrete facts, the study of Euclid constitutes an unrivalled training in methodical and cogent reasoning. The great charm and value of Euclid's presentation is the way in which one proposition hangs logically upon another. Sequence and sustained cogency of argument are the vital matters. The bad teacher ignored all this, requiring only verbal accuracy in memorising details, and brought disrepute on the finest mental discipline ever introduced into education. But Euclid is gone, and there has been nothing put in its place. It is the

Digitized by Google

writer's deliberate opinion that boys nowadays are less capable of following a sustained train of thought than they used to be. The mental discipline of the chain of connected thought is strange to them. There may be other causes also; but this is assuredly a cause.

It may be that in the evolution of literate studies, particularly in the teaching of the analysis of sentences and in the logical composition of exercises, some equivalent discipline may be found. But it is doubtful whether in the study of English in the schools as much attention is given to analysis as was the case ten years ago. Every educator interested in maintaining a good balance in the subjects of preliminary education will surely agree that, while premature specialisation, whether in languages or in science, is to be deprecated, boys must be trained in thinking and in the expression of thought. In the conflict of subjects one is apt to lose sight of the fact that training in thinking and in the correct expression of thought is more essential than the study of any particular subject, whether Greek or geometry. It is, after all, not so important whether the hours per week given to science should be a few more or a few less, as that in all studies—science, mathematics, language or literature—there should be cultivated precision in the use of words, and cogency in modes of thought. These things are more important in the long run, and vastly more important in the ultimate making of a professional engineer, than the acquisition of a hoard of scientific facts. The secondary school must not degenerate into a house of cram.

Dr. Gow's* and Prof. Thompson's Papers were then jointly discussed.

DISCUSSION.

Sir JOHN WOLFE-BARRY, K.C.B., F.R.S. (London) said they would all be in accord with the last sentence of Prof. Thompson's Paper. In fact, the only point of issue between the two Papers seemed to be the amount of time that should be given to each subject. They would all be agreed that literature should be one of the subjects studied. It seemed that too much was attempted at secondary schools at the present time. Mind culture only should be undertaken up to the age of 16, and laboratories in such institutions, therefore, seemed unnecessary. Language and history were very important. He doubted, however, whether there was quite as much time as Prof. Thompson seemed to think for interesting lectures. What engineers wanted was more general culture than had been given by any system of engineering education so far laid down. When the time came for retirement, as he (Sir John) had now retired, the engineer would find how valuable was that broad outlook on politics and literature which only general culture could give. General culture was an absolute necessity for an engineer.

Mr. T. REUNERT (Johannesburg) pleaded that the Institution should lay down, as a result of this Conference, some definite syllabus for engineering education.

Dr. W. H. D. ROUSE (Cambridge) congratulated the Institution on paying so much attention to the subject of general education; but they might go further in bringing pressure to bear on the schools. The schoolmaster was at present exposed to the two forces of uninstructed public opinion and the examination evil. Prof. Thompson's remarks on the latter question were not half strong enough. Examiners paid attention to points that did not matter, and a well-educated boy who went in for certain local examinations had to be crammed to understand the questions proposed, though his general knowledge might be excellent. No intelligent plan of education was possible where local examinations had to be passed; and while State and teacher co-operated in Germany no such co-operation was present in this country. The fault of all this was really with the parents who took little notice of the effect of education upon their children's minds.

Mr. W. WHITAKER, F.R.S. (Croydon) disagreed with Sir John Wolfe-Barry that culture must be obtained early in life. Culture could be obtained all through life. More attention should be paid to the teaching of English, while mathematics was absolutely necessary for engineers.

Mr. R. MULLINEUX WALMSLEY (London) also called attention to the want of goal in British secondary education; but the ignorance of parents was to a large extent responsible for this. The London matriculation was bad, but all criticism of it had been destructive, and it could not be given up because of the funds it brought in. (Prof. Thompson: "That is scandalous.") Euclid had been deposed and nothing had been put in its place, so that there was a total absence of geometrical knowledge in pupils coming from secondary schools.

Mr. S. DE BRATH (East Grinstead) thought a syllabus of training would be a mistake. The present evil went further back than the secondary schools, that was, to the preparatory school. So bad, in fact, was preparatory education that Osborne had been founded by the Admiralty, and the War Office had under consideration the establishment of a similar institution for the training of prospective army officers. There was no need for a small boy to be worked hard, but his interest must be excited.

Prof. W. S. ABELL (Liverpool) thought the young engineer should be taught to think dynamically.

Col. J. E. CAPPER, R.E. (School of Military Engineering, Chatham), thought that secondary education should be so arranged that some grasp of economical questions was obtained. They found at Chatham the more diverse the subjects an officer was taught the better he seemed to get on. Further, he assimilated technical work better after a general education. The Institution could not be too careful in formulating any scheme of instruction for candidates, and the general standard of education should be made high.

Mr. T. H. BAILEY pointed out that the clever boy was not always the most successful, but he thought more might be done by putting clever boys in charge of six or seven duller boys for instructional purposes. This had been done in the Boy Scout movement with conspicuous success. It should not be the aim of the public schools to turn out professionally trained men, but it should be their aim to turn out gentlemen.

Dr. J. GOW (in reply) hoped the Institution would not start a new rigid examination. The schools were not responsible for the multitude of examinations, and if certain "equivalent" examinations were allowed it would be a great advantage to schoolmasters.

Prof. S. P. THOMPSON (in reply) said that the faults in present-day secondary education were not due to the schoolmasters. It was a scandal that any university should be dependent for its funds on matriculation fees. It was a great point that English should be properly taught. The Institution might well go further than they did at present and state expressly that they would accept without exception certain matriculation examinations in lieu of their own.

The following Paper by Prof. A. SCHWARTZ was next read:—

THE QUESTION OF SPECIALISED ENTRANCE EXAMINATIONS FOR UNIVERSITY OR COLLEGE COURSES OF STUDY IN ENGINEERING SCIENCE, WITH A VIEW TO THE CURRICULA TO BE FOLLOWED, AND ALSO OF THE INCLUSION IN THE LATTER OF COURSES IN MODERN LANGUAGES.*

BY PROF. A. SCHWARTZ, M.SC.

The functions of the secondary school and of the college course are as follows: (*a*) The function of the secondary school is to give a liberal general education—that is, to impart a limited amount of knowledge, in a range of subjects so selected and dealt with as to develop the mental faculties in a comprehensive manner. (*b*) The function of the college course is to impart a certain amount of knowledge of a specialised character, and to train and develop further the mental faculties along specific lines.

The function of the entrance examination for university or college courses in engineering science may be taken to be the determination of the fitness or otherwise of the candidates to pursue the contemplated course of specialised study. This question of fitness may be regarded from two standpoints as representing: (1) A satisfactory standard of general education. (2) In addition to a general education, a satisfactory standard of attainment of a specialised character in subjects germane to engineering science.

In the writer's opinion the matriculation examination of a university should follow the first of these alternatives, as it should be essentially a test of general education and should admit to all faculties. The governing bodies of the leading professional societies, however, have exhibited a growing tendency to call for some degree of specialisation in the matriculation examinations. Hence the special obligatory subjects, or higher papers frequently demanded (in addition to the ordinary subjects of the matriculation examination) to qualify for entry in the faculties of law, medicine or engineering. Similar conditions are frequently imposed in the entrance examinations to courses in engineering science in colleges which are not constituents of universities. These special demands have to be met by the secondary schools.

The average boy of 16 years of age who has had a liberal general education is not usually in a position to negotiate successfully these specialised entrance examinations; he, therefore, extends his school course, the final portion of which is, therefore, devoted to "preparing" him to meet the requirements of the examination market, or for the special requirements of his future career. The subjects which are in varying degree common to the college courses in engineering science and to the secondary schools are: Mathematics, mechanics, physics, chemistry, geometrical and freehand drawing, manual training and modern languages. In the matriculation examinations for the universities, and in the entrance examinations for engineering courses, these subjects are treated either as obligatory or optional subjects. Mathematics is invariably made obligatory, and the standard of the examination in this subject should, therefore, be such as may be compassed in the course of a liberal general education on either the classical or the modern side of a secondary school. The science subjects selected for tuition in the secondary schools vary in different schools, and this fact is recognised in the matriculation and entrance examinations by giving an option to the candidate in the selection of one or more of these subjects. The fact that these

* An abstract of Dr. Gow's Paper was given on p. 462 of our last issue.—ED. E.

* Abstract.

Digitized by Google

options are widely exercised renders it impossible to commence the college courses in these subjects otherwise than *ab initio*. It is evident, therefore, that the treatment in the secondary schools of science subjects other than mathematics must be regarded as having an educative value rather than an instructional one. The object of teaching modern languages in the secondary schools at the present time is not so much the investigation of the logic of language, and the reflex action of its grammar on the structure of other languages—and particularly of our own—as to furnish the ability to think, and speak, and write in a foreign tongue. This teaching of modern languages may, therefore, be regarded as specialised instruction. Here again the average boy of 16 years of age falls short of the standard aimed at. For technical purposes a reading knowledge of the langauge is perhaps sufficient, but while the average boy, on leaving school, may be able to read a scientific French work with the aid of a dictionary, he is usually quite unable to deal fully successfully with a German work of a similar character. Instruction in German, therefore, frequently forms part of the courses in the engineering colleges, and, regarded as specialised instruction, it is not here out of place.

In conclusion, it appears to the writer to be particularly necessary, in the case of the engineer, that his secondary school training should be on as liberal lines as possible, since his subsequent training in the college, the workshop, and the office is largely materialistic. In this connection we shall do well to remember Tredgold's famous definition of a civil engineer as one who controls the forces of Nature for the use and convenience of man, and to note that this definition postulates not only a knowledge of natural philosophy, but a knowledge of the humanities also. What is wanted in the engineering courses is a supply of students with a wide mental outlook, whose faculties have been well trained and evenly developed, and any specialisation in the secondary school at the expense of this liberal training is to be deprecated. Let us bear in mind, with Emerson, that Nature is not fixed but fluid, and that spirit alters, moulds and makes it. The future of the whole human race is closely bound up with the work of the engineer; we should see to it, therefore, that his preliminary training shall be in no sense a narrow one.

DISCUSSION.

Mr. J. T. Jackson (Dublin) thought that an entrance examination should be designed with a view to discovering whether a student would take advantage, or not, of the course, and should further be designed to test the quality of the student's general education. Students should not be allowed to specialise before they were educated. In fact, their early training should not be too practical or their later training too scientific. There was very little connection between a student's success in the final examination and his success in after life, but there was a marked connection between age and success, for the younger the student started his work the better he seemed to succeed.

Mr. W. H. Patchell (London) said that the time available for the student to take a course was the crux of the question. More attention ought to be paid to modern languages, especially to Spanish and German, which were both of the highest importance to the engineer at the present time. He would like to enter a protest against trick examinations in which no honestly educated boy had a chance.

Dr. W. C. Unwin, F.R.S. (London), thought that non-specialisation in the early education of the engineer might be carried too far. A boy did not usually begin his engineering education proper until he was 18; that meant, under the Institution scheme, he earned no wages till he was 24. Was it then too much to ask that each student before entering college should have a good knowledge of elementary mathematics and of one branch of science? But there was considerable difficulty in complying even with these light conditions and the schools ought to have done better. His experience with regard to the after-career of students was not that of Mr. Jackson, but quite the reverse.

Mr. H. J. Spooner (London) found fault with the way mathematics was taught to engineering students. At the schools it was too theoretical, at the colleges it was practical, and the student had to unlearn much of what he had been taught; but to obtain a degree he had to turn to the theoretical side again, and therefore wasted time.

Mr. S. de Brath (East Grinstead) said the demands on the time of the student were so large that he should begin the study of modern languages early.

Prof. E. W. Marchant (Liverpool) drew attention to the absolute necessity of some specialisation from the first. All teaching must have some end in view. At present attempts were made to teach too many subjects, with the result that no real knowledge of any one subject was obtained. Science was just as good a basis of education as classics.

Prof. A. K. Schwartz (Liverpool), in reply, said that the Institution only asked for a moderate degree of specialisation in their examinations, but a matriculation had another object, that of ensuring the student had had a general education. All the faculties were demanding special matriculation examinations suitable to their particular needs, with the result that these examinations were not tests of general culture.

The Chairman (Mr. B. Hall Blyth) thought that such a conference as they had had that morning must lead to some good result. He would like to see Euclid re-introduced into the school curricula. He agreed that the present Institution examinations tended to encourage cramming, but they were trying to get over this difficulty.

SECTION III (Practical Training.)

Mr. R. Elliott-Cooper, vice-president of the Institution, who presided over the meeting of Section III., made the following opening remarks:—

The object of this Section is to discuss and endeavour to settle some of the difficult questions which present themselves to young men who seek to obtain such practical training as would fit them for the career of an engineer, apart from any particular branch of engineering, and also to enable them to obtain the recognition of the Institution of Civil Engineers, which is becoming more and more important. In discussing these questions, it is obviously most important that, if possible, all should be agreed as to what "practical training" really means. I am afraid, however, that the general opinion upon this point is by no means settled.

In the early days of engineering the practical training of a young engineer in the mechanical branch of his profession went very little beyond the performance of the work of a mechanic, under conditions that fell far short of what was necessary to train him so as to enable him to take a superior position in regard to the design or control and management of engineering works. A great advance was made when it was recognised that it was essential that young engineers should possess a sound general education and also some scientific knowledge bearing upon the theory and practice of their profession. Although such an education has generally shortened the period of practical training, it has by no means taken the place of such training, or rendered it less necessary to all who hope to succeed in their profession.

The first point which I should like to make clear is that real and useful practical training, whether in design, construction, or management of works, can only be obtained under the actual or commercial conditions which necessarily cannot be found in education establishments. There is an idea in the minds of a good many people that the old custom of pupilage had passed away. That, however, is very far from the case, and in my opinion, the routine (under proper supervision) of the drawing office and works, whether in the civil or mechanical branch, is just as important now as it was considered in former days, the only difference being that the young engineer of to-day is better equipped, by reason of the advance in scientific education, to take advantage of the practical training afforded him. Dealing for a moment with civil engineering (as distinct from mechanical engineering), it is obvious that any efficient training must embrace experience in various kinds of work, such as designing, drawing, specifying and estimating, all of which would be part of the ordinary routine of an engineer's office. He must also be trained in construction work, embracing setting-out, measuring-up, and general administration.

A great mistake which many young engineers make is in thinking that all that is necessary on completion of their college career to make them efficient assistant engineers, is either to go into a workshop and spend, say, two years, on the ordinary work of a mechanic, or (if civil engineering is to be his career) to go to a contractor upon some works of construction. The knowledge so gained is most useful, but without the office training, embracing the subjects, amongst others, which I have mentioned, he is only half equipped for the work of his profession.

There is doubtless a belief in some quarters that the system of training by definite apprenticeship and pupilage, which was certainly affected and modified some years ago by reason of the movement in favour of better scientific education, has fallen largely into disuse, and statements are sometimes made that it has been actually abandoned by the majority of engineers. Such an idea can only arise from an imperfect or very partial acquaintance with the engineering profession. It may be quite true that in a few branches of engineering, or pursuits cognate with engineering, pupilage, or its equivalent, does not occupy its former place, but taking the profession as a whole, that is not so.

In corroboration of this statement may be quoted the result of an inquiry made on behalf of the Council some months ago, which was directed to ascertain the position of pupilage, or other equivalent practical training, in manufacturing workshops and in the engineering departments of important railways, docks, and other large undertakings and authorities. The result of that inquiry was that in 75 per cent. of the cases considered there were regular arrangements for pupilage, and in only 25 per cent. was no provision made for such regular practical training. It may be observed that of the 25 per cent., more than half the cases occurred in the engineering departments of municipal authorities, which certainly might be expected to make better provision for the acquisition of practical training of a kind suited to prepare young men to become competent municipal engineers. The inquiry referred to was not addressed to engineers in private practice, but it is a matter of common knowledge that the system of pupilage remains extensively recognised amongst

Digitized by Google

consulting engineers, although the requisite term of such training has been shortened in view of the better educational qualifications now generally possessed by young engineers.

The question of the conditions under which practical training can be, or should be, obtained, and of the means which might be taken to procure for intending young engineers, whether college-trained or not, fuller and better opportunities of acquiring that practical knowledge of engineering as actually performed which is essential to their becoming good assistants and, later on, efficient masters, is a matter for discussion and consideration by this section of the conference, from which it is trusted that good results and a better understanding may ensue.

This was followed by a Paper by Mr. A. F. YARROW, of which we give an abstract below :—

THE APPORTIONMENT OF TRAINING BETWEEN PRACTICAL WORK AND SCIENTIFIC STUDY, WITH SOME SUGGESTIONS APPLYING TO APPRENTICES IN OR ON WORKS FAR DISTANT FROM THEIR HOMES.

BY A. F. YARROW AND MEMBERS OF HIS STAFF.

The observations now submitted deal only with two points :—

First.—Although the advantages and disadvantages from a purely educational point of view of what is termed the "sandwich system" have been frequently dealt with, the social aspect of the question has perhaps been overlooked, and this is one point with which we propose to deal. In considering the question of engineering students, we have been frequently impressed by their need of being accommodated with courses of study which would enable them to get their practical training without the necessity of being banished from home influences for a continuous period of several years at a most critical time in their lives. It will be admitted, for instance, that London can no longer be looked upon as an engineering centre ; consequently, it is necessary for young men to obtain their practical training in the North, where engineering workshops exist.

This practical training, if continuous, would probably not be of less duration than three years, and these young men, who possibly have no friends or relations with whom they can live when serving their apprenticeship away from their family, must reside in lodgings under conditions of much discomfort, and if this condition should exist for lengthened periods during the student's youth, at an age when every young man is subject to a certain amount of temptation, experience has shown that the risk is considerable.

Now, if their practical and theoretical training can be so arranged that during the six summer months they work in the shops while living in lodgings, and during the six winter months they take up theoretical study in the colleges, living at home and subject to good influences and affectionate surroundings, this home influence is a source of great security, especially if the six months they work in the shops be during the summer, when their spare time can be spent in outdoor pursuits. Unless courses of study can be arranged to alternate with periods of practical work, so that the young man avoids being banished from his home, he will clearly be placed at a disadvantage compared with those young men whose homes are in the manufacturing districts, such as Glasgow, Newcastle or Birmingham. For these reasons we submit that the colleges, especially those in London, should endeavour to arrange their courses of study so as to conform to the social conditions indicated above as desirable, and that they should arrange their engineering courses of study during the winter months.

Second.—We would draw attention to the desirability that in works some member of the staff should be looked upon as an adviser to the apprentices, it being among his duties to get into personal touch with each young man. The young men should not be thrown into the shops without anyone to advise them in their studies or otherwise, or to whom they could turn in a difficulty. It is clearly undesirable for an apprentice to be simply under the eye of the foreman, who would probably not trouble himself about the interests of the lads themselves. Those who have worked in the shops will know that it is almost impossible for a young man to obtain an interview with the heads of the firm, even if he had the courage to do so ; he has to pass through the various offices, and will probably be stopped somewhere on his way, and even if he did get access to the heads, they would doubtless be engaged on important matters, and would have very scant time to devote to the lad. It would, therefore, be a very desirable thing if in works some gentlemen could make it part of his business, as it were, to befriend the apprentices. He should be accessible at all times, and should make a point of interviewing each lad at least once in three months, and ascertain if he could be of service to him. He should also from time to time ascertain what progress is being made by those lads who attend evening classes by periodical visits to the local technical schools. A record should be kept in a book for the purpose, so that the heads of the firm can see at a glance the opinion formed of the various apprentices.

This system would not only be a great advantage to the lads themselves, but would enable employers to recognise ability and industry, and select wisely those young men whose services they might desire to retain when their apprenticeship terminates, for it is a notorious fact that often employers have lost the services of many capable men through being ignorant of the talent that has passed through their works. Consequently, we submit that, taking a broad view of the two questions under consideration, employers would probably be gainers by facilitating what is herein indicated as desirable.

DISCUSSION.

Mr. F. E. ROBERTSON (Glasgow) said in regard to locomotive engineers it was surprising the number of candidates who came forward without any knowledge of elementary mechanics or metallurgy. The proportion of efficient candidates he estimated at not more than 5 per cent. Many candidates had no knowledge as to the differences in steel, nor of alloys of metal. The remedy he suggested was that men should not be recommended for positions in charge in the many departments of railway working unless the candidates had a practical knowledge of mechanical engineering.

Prof. J. O. ARNOLD (Sheffield) said he was surprised at Mr. Robertson's remarks. He was in close touch with the Midland Railway College and knew that in that establishment no such ludicrous conditions prevailed as were referred to by Mr. Robertson. The men were turned out absolutely efficient in all branches of railway work, and every possible step was taken to produce the kind of man Mr. Robertson asked for, the company requiring their apprentices to attend a metallurgical course in their fifth year.

Mr. E. R. DOLBY (London) said the trouble seemed to be that engineering as a profession was not more definitely sub-divided. In the building trade, four separate persons were responsible for the completion of the work, the architect, the quantity surveyor, the builder and the clerk of works. In turning out an engineer there was too much attempt to turn out men acquainted closely with a subject that should be divided into several sections.

Mr. C. O. BURGE (London) said no mention had been made of the preparation of a civil engineer for service abroad. Much of the great work in England had been already done and the civil engineer must in the future look to the Empire for scope for his abilities. It was necessary, therefore, that the training should comprise the conditions prevailing in the Colonies and abroad.

Mr. E. BENEDICT (London) said in regard to those remarks, in his early days he was advised to learn his profession in England and practice it abroad, and after a lengthy career he found that advice the best. The practice of the Midland Railway in regard to apprentices, he thought was a magnificent example of how it ought to be done. People or firms who accepted premiums should consider that they had a certain amount of responsibility. The educational material in the workshop should not be overlooked and the old steady hands should be selected to take charge of premium apprentices.

Mr. A. H. S. MCCALLUM (Chelmsford) said that the member of the staff selected to look after the apprentices would have to be very carefully chosen, as his work would be onerous, as apprentices in their own interests should not be allowed to follow their own ideas too closely. As to the college and works training, he thought strongly that it was a great disadvantage to keep the two distinct. The two should, as far as possible, be sandwiched together. The tendency was to mix the two classes of training more intimately. He divided engineers into two classes, the abnormal and the normal. The abnormally theoretical, the designer; and the normal, the practical man, the engineer in charge and the man who handled materials. The first mentioned was largely in the hands of the colleges, but for the practical engineer a combination of the theoretical and practical was necessary, which, however, entailed rather shorter hours at the works.

Mr. J. M. MONCRIEFF (Newcastle-on-Tyne) said he hoped there would be as few abnormal engineers as possible. As to the hours of working he considered it necessary that apprentices should start at 6 in the morning with the ordinary workmen.

Prof. E. G. COKER (London) said he agreed that there should be a closer connection between the workshop training and the college studies. He personally favoured the sandwich system because if the college course was gone through first the young man had only a vague idea of the importance of certain details in connection with practical engineering. Practical knowledge could not be obtained in a college or training school.

Mr. A. H. PREECE (London) said a practical training was essential for the engineer. The difficulty which cropped up was the receptive nature of the student. The whole future of an engineer depended largely upon his earliest training. The college course was important, but workshop experience was even more so, and it was a mistake for college people to advance the idea that the three-year course in works could be dispensed with.

Prof. W. E. DALBY (London) said the sandwich system as advanced by Mr. Yarrow carried with it so many advantages that it was almost superfluous to comment on it. The system should, however, be so arranged that there would be a certain amount of time available for research work. He agreed that the general average of candidates for railway engineering were deficient in the knowledge really necessary for their profession.

(To be continued.)

The Rates for Subscription to "THE ELECTRICIAN" are as under:—

	Year.	Half-Year.	Quarter.	
United Kingdom	26s. 0d.	13s. 6d.	7s. 0d.	Post free, payable in advance.
Canada	28s. 3d.	14s. 6d.	7s. 6d.	
Postal Union	30s. 0d.	16s. 0d.	8s. 0d.	

New volumes of "THE ELECTRICIAN" *commence in April and October.*

(This charge includes all the numerous Supplements.)

Vols. I to LXVI. can now be supplied. Price on application.

"THE ELECTRICIAN" SERIES OF STANDARD ELECTRICAL BOOKS

can be obtained of all Booksellers at Home, in the Colonies, and Abroad.

'THE ELECTRICIAN" ELECTRICAL TRADES' DIRECTORY AND HANDBOOK. Published annually in February, corrected to mid-February. Established 1882. A very valuable advertising medium, covering the entire Industry. SUBSCRIPTION Price (which is received *in advance* up to Jan. 31st in each year for the next following edition) 8s 6d. nett, postage 9d. extra. Published price 15s. nett, postage 9d. extra. Postage to British Colonies, 2s; Europe, 2s; U.S.A., 3s. 6d.; other countries, 2s. 6d. *Digest of Contents of the* 1911 *Edition sent free on application.*

THE PRACTICAL WIRELESS SLIDE RULE. By Dr. H. R. Belcher-Hickman. Price 2s. 6d. nett.

LIVINGSTONE'S DIAGRAM FOR THE EASY CALCULATION OF SHAFT AND BEAM DEFLECTIONS. By R. Livingstone. 2s. 6d. nett. By post in tube, 2s. 10d.

"THE ELECTRICIAN" PRIMERS (81 Primers in all, and a GLOSSARY). Single Primers 3d. each post free. *New and Enlarged Edition in One Complete Vol. or Three Separate Vols.* FULL PROSPECTUS FREE.

ELECTRIC TRACTION ON RAILWAYS. By Philip Dawson. Price 25s. nett. *Prospectus free.*

ALTERNATING-CURRENT MOTORS. By Dr. Rudolf Goldschmidt. Price 6s. 6d.

THE SHOT-FIRER'S GUIDE: A Practical Manual on Blasting and the Prevention of Blasting Accidents in Mines, Quarries, &c. By W. Maurice. Price 3s. 6d. nett.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. Wilkinson, M.I.E.E. *New Edition.* Now ready. Price 15s. nett.

ELECTRIC BLASTING APPARATUS AND EXPLOSIVES: With Special Reference to Colliery Practice. By W. Maurice. Price 8s. 6d. nett.

THE ELECTRIC FURNACE IN IRON AND STEEL PRODUCTION. By John B. C. Kershaw, F.I.C. Price 3s. 6d. nett.

BRAKES FOR TRAMWAY CARS. By H. M. Sayers. Price 3s. 6d. nett.

THE MECHANICAL DESIGN AND CONSTRUCTION OF COMMUTATORS. By R. Livingstone. Price 6s. nett.

THE ALTERNATE-CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Prof. J. A. Fleming, M.A., D.Sc., F.R.S. [abroad 13s.

VOL. I.—Price 12s. 6d. post free, abroad 13s. VOL. II.—Price 12s. 6d. post free, abroad 13s.

HANDBOOK OF THE ELECTRICAL LABORATORY AND TESTING ROOM. Very fully illustrated. By Dr. J. A Fleming. Vol. I., 12s. 6d. nett, Vol. II., 14s. nett.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. Fleming. 6s. nett.

ELECTRICAL LABORATORY NOTES AND FORMS. Arranged by Dr. J. A. Fleming, M.A., F.R.S. Single copies 4d. nett, or in dozens at 3s. 6d. nett. Complete Sets of 50 Notes and Forms, 12s. 6d. nett, or in strong portfolio, 14s. nett; or bound in strong cloth, 15s. nett. Spare Copies of Tabular Sheets, 1s. per dozen. Portfolios, 1s. 6d. each. Sectional paper, 1s. per dozen sheets. *Complete Prospectus post free on request.*

ELECTRICITY METERS: THEIR CONSTRUCTION AND MANAGEMENT. By C. H. W. Gerhardi. Profusely illustrated. Price 9s. nett.

ELECTRICITY IN HORTICULTURE. By Prof. S. Lemstrom. Illustrated. 3s. 6d nett.

RADIO-ACTIVITY: AN ELEMENTARY TREATISE FROM THE STANDPOINT OF THE DISINTEGRATION THEORY. By Fredk. Soddy, M.A. Fully illustrated. Price 6s. 6d. nett.

ELECTROMAGNETIC THEORY. By Oliver Heaviside. Vol. I. Price 12s. 6d. Vol. II. Price 12s. 6d. *Vol. III. in the press.*

MOTIVE POWER AND GEARING FOR ELECTRICAL MACHINERY. By E. Tremlett Carter, C.E., M.I.E.E. Revised by G. Thomas-Davies, A.M.I.E.E., F.C.S. Price 12s. 6d. nett.

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. Ewing, B.Sc., F.R.S., F.R.S.E. Price 10s. 6d.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. Kennelly and H. D. Wilkinson, M.I.E.E. Price 6s. 6d.

ELECTRIC MOTIVE POWER. By Albion T. Snell. Price 10s. 6d. nett.

A POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. Gelpel and H. M. Kilgour. Price 7s. 6d. nett.

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. Elton Young. Price 10s. 6d.

STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By H. K. C. Fisher and J. C. H. Darby. Price 7s. 6d. nett.

SIGNALLING ACROSS SPACE WITHOUT WIRES: THE WORK OF HERTZ AND HIS SUCCESSORS. With new Chapter on Tuning. By Dr. Sir Oliver J. Lodge. Price 5s. nett.

THE ART OF ELECTROLYTIC SEPARATION OF METALS. By Dr. G. Gore, LL.D., F.R.S. [Price 10s. 6d.

ELECTRO-CHEMISTRY. By Dr. George Gore. Price 2s.

BEGINNER'S MANUAL OF SUBMARINE CABLE TESTING AND WORKING. By G. M. Baines. Price 7s. 6d. nett.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By Francis Jehl. Price 10s. 6d.

"THE ELECTRICIAN" WIREMAN'S POCKET BOOK. Price 5s. nett.

"THE ELECTRICIAN" HANDY WIRE TABLES FOR THE POCKET. By P. B. Down, Wh.Ex., A.M.I.Mech.E. Price 2s. 6d. nett.

THE RATING OF ELECTRIC LIGHTING, ELECTRIC TRAMWAY, AND SIMILAR UNDERTAKINGS. By W. G. Bond, M.I.E.E. Price 2s. 6d. nett.

DRUM ARMATURE WINDING AND COMMUTATORS. By F. M. Weymouth. 7s. 6d.

PRIMARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By W. R. Cooper. Price 10s. 6d. nett.

SECONDARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By E. J. Wade.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. Price 1s. 6d. [Price 10s. 6d. nett.

THE LOCALISATION OF FAULTS IN ELECTRIC LIGHT CABLES. By F. C. Raphael. 7s. 6d.

THE STEAM-ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. Beaumont, M.I.C.E., M.I.M.E., &c. Price 6s. nett.

THE ELECTRIC ARC. By Mrs. Ayrton. M.I.E.E. Price 12s. 6d.

TRAMWAY TRACTIVE EFFORT AND POWER DIAGRAM. By Arnold G. Hansard, B.A., A.M.I.E.E. Price 4s. 6d. nett; in Tube, 5s.

THE BRITISH POST OFFICE TELEPHONE SERVICE. Fully illustrated. Price 3s. 6d. nett.

INTERNATIONAL TELEGRAPH CONVENTION AND SERVICE REGULATIONS. Price 6s. nett. (LISBON REVISION, 1908.)

BOILER FEED WATER. By F. W. Anderson. Price 6s. nett.

(PRELIMINARY) WIRELESS TELEGRAPH CONFERENCE (BERLIN, 1903), PROCEEDINGS AT. Price 8s. 6d. nett.

INTERNATIONAL WIRELESS TELEGRAPH CONVENTION AND SERVICE REGULATIONS (BERLIN, 1906). With complete report of Proceedings. Price 21s. nett.

THE TWO-TONE VIBRATING TRANSMITTER AND CABLE INDUCTIVE SIGNALLING. By Edward Raymond-Barker. Price 1s. nett and post free. [Price 3s. nett.

THE CLASSIFICATION OF ALTERNATE-CURRENT MOTORS. By V. A. A. Fynn, M.I.E.E.

ELECTRIC CRANES: THEIR DESIGN, CONSTRUCTION AND APPLICATION. By H. H. Broughton. Being Vol. I. of a Complete Manual of Lifting and Hauling Machinery. *Ready shortly*, price 25s. nett.

MANUAL OF THE TELEPHONE. By W. Aitken, M.I.E.E. *Nearly ready.*

ELECTRIC MAINS AND DISTRIBUTING SYSTEMS. By J. R. Dick, B.Sc., and F. Fernie, A.M.Inst.C.E. *Nearly ready.*

ELECTRICAL MANUAL FOR MINING ENGINEERS. By H. J. S. Heather, M.I.E.E. *Ready shortly.*

THE MECHANICAL DESIGN AND CONSTRUCTION OF GENERATORS. By R. Livingstone. *In Preparation.*

STUDIES IN LIGHT PRODUCTION. By R. A. Houston, M.A., Ph.D., D.Sc. *In Preparation.*

LIGHT, RADIATION AND ILLUMINATION. From the German of Paul Hörner, by Justus Eck. *In Preparation.*

WIREMAN'S POCKET BOOK AND ELECTRICAL CONTRACTOR'S HANDBOOK. Compiled by A. W. Robinson and W. E. Warrilow. *In Preparation.*

The Electrician.

The Oldest Electrical Journal (established as a weekly Journal, 1861-1878).

Published every Friday, Price Sixpence; Post Free, Sixpence-Halfpenny.

Editorial, Publishing and Printing Offices,

"THE ELECTRICIAN" INDUSTRIAL SUPPLEMENT.

With "THE ELECTRICIAN" for Sept. 14, 1906, was issued the first of a series of "Industrial Supplements," to be published from time to time with "THE ELECTRICIAN." The fifty-third issue of the Supplement published (Gratis) with the number of "THE ELECTRICIAN" for September 23, 1910, was the last of the monthly issues. "THE COMMERCIAL AND INDUSTRIAL SUPPLEMENT" to "THE ELECTRICIAN" is now issued weekly (Gratis). It will be found towards the end of the present issue.

NOW READY.

Vol. LXVI. of "THE ELECTRICIAN." Bound in Publisher's covers. Price 17s. 6d. Postage U.K. 1s. extra, abroad 2s. 6d.

Cases for binding Vol. LXVI. are now ready, price 2s.; post free, 2s. 3d.

THE PURCHASE OF FUEL.

The question whether fuel for electricity supply stations should be purchased on a heat basis gave rise to an interesting discussion last week at the meeting of the Incorporated Municipal Electrical Association at Brighton. Since the engineer desires as much heat as he can obtain for a given sum of money, it appears quite logical that the thermal value of the fuel should be taken as the basis of purchase and that British thermal units should be paid for rather than tons of coal. The cost of fuel is generally the largest item in works costs over which the engineer has control and therefore it is very important that this item should be brought down as low as possible. Thus it is not surprising that a number of station engineers have given careful attention to the subject. Among these may be mentioned Mr. C. E. C. SHAWFIELD, of Wolverhampton, who opened the discussion last week at Brighton, and Mr. A. P. CHATTOCK of Birmingham. By means of careful tests Mr. SHAWFIELD obtained an annual saving in the first two years after starting his testing department of £500 per annum. Similarly Mr. CHATTOCK obtained a reduction of 22 per cent. in his fuel cost per unit generated during a period of three years. Among the large undertakings which purchase fuel on a thermal basis may be mentioned the London County Council Tramways and the London Underground Railways each of which undertakings requires about 150,000 tons of coal per annum.

On the other hand, there are many engineers who are very opposed to taking the thermal value as a basis for purchase. They point out that coal agents object to such

Digitized by Google

a basis, and the chance is that if the supplier of coal is made responsible for its thermal value he will, of necessity, put up his price in order to provide for the risk, so that in the end the purchaser will gain nothing. They also take the view that such tests are frequently very misleading.

With regard to the value of laboratory tests, it must be remembered that such tests are not by any means easy. If the very small quantity of coal used in tests is to be taken as a true sample of, say, a boat load of coal, then it is obvious that such sampling must be carried out with extreme care. The sample taken from the boat must be a true average sample of the boat load, and the small quantity of this taken for the test must again be a true sample of the larger quantity. Even if the sample has been properly taken, calorimetric testing requires a certain amount of skill.

Finally, there is the undoubted fact that the calorimeter takes account of all the heat, whereas the boiler rejects a certain amount, and only makes use of the remainder more or less efficiently. Moreover, the efficiency of the boiler depends not merely upon the boiler itself, but upon the stoking and the class of fuel, quite independently of its thermal value.

The question is complicated to a small extent by the fact that contracts may be made with either coal owners or coal agents. Generally speaking, it appears that coal agents are the more easily dealt with of the two. In some respects the coal owner is in a better position, because he knows what is coming out of his pit, and he ought, therefore, to be able to guarantee results more readily. On the other hand, he would feel more disposed to guarantee results at the pit than at some distant works. The coal agent, on the other hand, buys from a number of pits, and therefore the quality of his coal is likely to vary to a large extent. For that reason he is more likely than the coal owner to be opposed to the guaranteeing of thermal results, even though the treatment of the coal during transit is more in his hands. In any case, it is scarcely to be expected that the price of guaranteed coal would be so low as of coal that is not guaranteed.

As in most cases of this kind, the truth seems to lie between the extreme opinions expressed in this discussion. It appears to us that it is not essential for the moment that fuel should be purchased on a purely thermal basis, but it is extremely desirable that systematic tests should be made of all fuel that is used. The coal supplied would certainly be very much better if a continual watch were kept upon the ash, the moisture and the thermal units. Even laboratory tests, pure and simple, in this direction should be effective, but it seems to be almost equally important that frequent boiler tests should also be made. Pending the education of coal owners and coal agents towards the appreciation of these ideas, we hope that every station engineer will make himself familiar with systematic fuel tests; they afford a valuable check if nothing more, and we are sure the result will be satisfactory in the long run. There is really nothing to be gained by waiting. Suitable apparatus can be obtained without any great outlay; experience, however, is a matter of time, and cannot be acquired hurriedly.

RECENT PHYSICAL RESEARCH.

VIII.—BROWNIAN MOVEMENTS.

BY D. OWEN, B.A., B.SC.

§ 1. If a liquid containing very fine particles—for example, water to which a small proportion of milk is added, or a mixture of dilute sodium hyposulphite and dilute acid—is examined under the high powers of the microscope, the particles are seen to be in incessant to-and-fro motion. If lateral illumination is employed, particles far smaller than those detectable by ordinary illumination manifest themselves, standing out, by the light they scatter, against a dark background, just like stars in the night sky. The lively dance of bright spots, often in brilliant colours, when sunlight or the light of the arc is used, is a fascinating one to watch. In 1827 the English botanist Brown called attention to this phenomenon. For a long time no attention was paid to the subject, which was regarded by physicists as carrying no special significance. In 1888 Gouy published the results of experiments which clearly showed the character of these movements to be independent of external vibration, of convection currents arising from inequalities of temperature in the liquid, and of the intensity of illumination employed. The movement goes on always, to a less extent the more viscous the liquid. He therefore put forward the hypothesis that we have here an agitation of the same nature as that postulated in the kinetic theory of matter.

The kinetic theory begins with the atomic conception of matter, adding the hypothesis of the incessant movement of the constituent molecules of a body. In the case of gases the theory is capable of being mathematically followed out in many of its consequences, as has been done especially by Clausius and Maxwell. One fundamental theorem is that of the equi-partition of energy among the molecules of a gas, independently of the nature of the molecule. If m denotes the mass of any molecule, v its velocity, then $\frac{1}{2}mv^2$, or w, the mean kinetic energy of translation of the molecule at any particular temperature, is a universal constant. It follows that all gases contain the same number of molecules, n, per unit volume, at the same temperature and pressure; or, in other words, that the number N of molecules in the gram-molecule of any gas is the same. The number of molecules in 2 grams of hydrogen and in 36·5 grams of hydrochloric acid gas is the same, being of the order of, say, 60×10^{22}. The pressure exerted by a gas is the resultant effect of the molecular bombardment of any surface exposed to the gas. It is thence deducible that $pv = RT$, and that $w = \frac{3R}{2N} \cdot T = \alpha \cdot T$, R having a constant value, $83{\cdot}2 \times 10^6$, for the gram-molecule. Thus, if w (or α) is known, N is known, or vice versâ.

The electronic charge e is also connected with N, since Ne is the charge conveyed by 1 gram of hydrogen in the electrolysis of water—namely, 96,540 ampere-seconds or coulombs, or 29×10^{13} electrostatic units.

The kinetic theory connects such apparently diverse magnitudes in gases as the pressure, the coefficient of diffusion, the thermal conductivity, and the viscosity.

§ 2. When applied to liquids the kinetic theory, owing to the complexity introduced by inter-molecular actions, has not found accurate mathematical expression. Van't Hoff, noting that the values of osmotic pressure obtained by Pfeffer depended only on the number of molecules of dissolved salt per unit volume, and not on the nature of the salt, and that the pressure was the same as that produced by the same number of molecules in the gaseous condition, concluded that the mean kinetic energy of each one of the molecules concerned was equal to that of a gas molecule. Going a stage further, the conclusion seems inevitable that not merely a few distinguishable molecules, but that *all* the molecules of a liquid, solvent as well as solute, should be regarded as possessing this same quantity, w, of kinetic energy of translation. Where the

Digitized by Google

liquid is electrically conducting, each ion is to be regarded as a molecule in the sense of possessing the same kinetic energy.

The kinetic theory has even been applied to the free electrons which are postulated as existing, like a very light gas, in the interstices of a metal. Supposing these electrons to possess the molecular kinetic energy w, dependent on the temperature of the metal, but independent of its chemical nature, the ratio of the electrical and thermal conductivities and the temperature variation of that ratio may be deduced. The calculated values show striking agreement with experiment. Lorentz, starting from this conception of free electrons, has deduced an expression for the heat radiation from a metal. Equating to the data of experiment, a value for w has been thence obtained agreeing very well with the value adopted for the ordinary gas molecule.

§ 3. The *Brownian movement*, as we have seen, raised the question as to whether the kinetic theory could be regarded as applying to particles consisting of assemblages of molecules so large as to be actually visible. Maxwell, writing on the kinetic theory, refers to the state of perfect repose which, even under the highest power of the microscope, appears to exist in a body. The Brownian movement forms an exception to this generality. Does it fall in the category of kinetic heat movement?

Since Gouy's arresting memoir of 1888 much has been done in the direction of an answer in the affirmative. In 1906 Einstein, and, independently, Smoluchowski, showed how to express the mean displacement of such a particle in terms of N. Einstein's formula is

$$\xi^2 = \tau \cdot \frac{RT}{N} \cdot \frac{1}{3\pi a \zeta},$$

where ξ represents the displacement in any given direction in a time τ, a denotes the radius of the particle assumed spherical, ζ the coefficient of viscosity of the surrounding medium. This equation contains the assumption that the particle possesses the mean kinetic energy of translation w, also that the frictional resistance to its movement through the medium is given by Stokes' celebrated formula, $F = 6\pi a \zeta v$, where v is the velocity of the particle with respect to the medium.

In 1908 and 1909 Jean Perrin made an extremely important series of experimental contributions to the subject. It is the main object of this article to outline the methods and the results of this remarkable research. His experiments fall in two classes. In the first place he conceived the idea of testing whether in a liquid medium in which are suspended granules of uniform size large enough to be visible, these particles follow the law of concentration that holds for a gas under the influence of gravity. In an enclosure at constant temperature the density of a gas is greatest at the bottom of the vessel, decreasing in geometrical progression as the height increases in arithmetical progression. The granules will follow this distribution if their mean energy of translation is constant. Denoting the value of this energy by W, the equation

$$\tfrac{3}{4} W \log \frac{m_0}{m} = \phi(\Delta - d) g h$$

holds; m_0 and m denoting the number of granules per cubic centimetre at two points between which the difference of level is h, ϕ the volume of each granule, Δ and d the density of the granular material and of the liquid respectively, g the acceleration due to gravity.

Microscope construction has now been brought to a high degree of perfection, and with the aid of lateral illumination particles of ultra microscopic magnitude can be rendered visible. Perrin realised the possibility thus presented of subjecting the above equation to the test of direct experiment. He prepared an emulsion containing granules of practically uniform size, and in showing that when allowed time—generally a few hours—to attain the steady state of distribution, the density of distribution of the granules decreases from the bottom of the vessel upwards, and this according to the exponential law. But whilst in the case of our atmosphere half density would be attained at a height of some 6 km., in the case of these emulsions the half concentration occurs with a rise of one-hundredth of a millimetre. The size of the granules and their density being also ascertained, a value of W was successfully arrived at. The crucial test is thus within reach of comparing this quantity with the constant w assigned by the kinetic theory to the gaseous molecular particle. It must be remembered that the latter quantity cannot be regarded as known with more than approximate exactness. The value of N may be taken as 60×10^{22}. The value of the corresponding number N′ obtained by Perrin for his granules was $70{\cdot}5 \times 10^{22}$.

Perrin's second series of experiments was in verification of Einstein's formula. The measurements required are of much difficulty. Armed, however, with a method of producing granules of uniform size, and with satisfactory means, discovered in the course of the preceding research, of measuring the size, he was able to establish the formula very satisfactorily over a large variation in size of granule, for granules of different material, and over a large range of variation of viscosity. The value $71{\cdot}5 \times 10^{22}$ so obtained for N′ shows practically perfect agreement with the value obtained by the first, radically different, method.

It appears, then, that Perrin's two lines of experiment lead to values for N (or for the mean kinetic energy of translation of the particle) which are of the same order as those assignable to a perfect gas. A more complete confirmation of the kinetic theory of the Brownian movement could hardly be looked for.

These experiments place the theorems of the kinetic theory on something like an experimental basis. Particularly of value are they in supporting the hypotheses of Van't Hoff and of Arrhenius in regard to solutions, when one remembers the strenuous opposition to their views that has proceeded from some chemists and physicists.

This work may well be regarded, as Perrin proposes, as giving a more accurate value of N than that deducible from gas data. Already physicists have come to regard the electrical method (depending, that is, on the determination of e) as more reliable than the older estimates. Possibly the accurate determination of e is of more interest even than that of N, and Perrin's number for the latter may be employed to furnish an independent value for the magnitude of the electronic charges. Taking, then, $N = 70{\cdot}5 \times 10^{22}$, we get the value $e = 4{\cdot}11 \times 10^{-10}$ E.S. units.

V. Henri has studied the Brownian movement cinematographically, taking photographs every twentieth of a second, with a period of exposure of one-three-hundred-and-twentieth part of a second. By the employment of solutions containing a sufficiently small number of particles per unit volume it is thus possible to obtain numerous points on the path of the same particle. The trajectory so derived is of the kind one imagines on the kinetic theory, though, of course, the straight elements joining two successive points do not represent the path between two collisions, but give merely the displacement of a particle after an immense number of collisions with molecules of the solvent.

Perrin has also studied the Brownian movement of *rotation*, for which Einstein had again found an expression, on the assumption that the kinetic energy of rotation is equal to that of translation. His measurements point to this equality, though probably the movements of rotation are not capable of sufficiently accurate measurement to justify the conclusion that absolute equality holds. This is of interest in connection with the theorem of the equi-partition of energy among the various degrees of freedom of a gas molecule, which has been advanced by Boltzmann, though not to the satisfaction of the majority of physicists.

§ 4. *Brownian Movement in Liquids.—Perrin's Work.*—The work of Perrin will now be considered in more detail. Let us consider first the different stages in the examination of the equation of distribution.

(*i.*) *Preparation of a Uniform Emulsion.*—After trial of several colloidal solutions, M. Perrin found a satisfactory material in *gamboge*, a substance well known as a water colour. One method of producing an emulsion is to treat the gamboge with methyl alcohol, which dissolves a considerable fraction. On

Digitized by Google

adding to the clear solution a considerable quantity of water, a yellow opaque emulsion is produced which consists, as shown by examination under the microscope, of a swarm of yellow granules of various sizes, all perfectly spherical. These can be separated by centrifuging from the containing liquid, which can then be replaced by pure water. A systematic procedure is next adopted comparable to the fractionation of a liquid mixture by distillation, in order to produce an emulsion consisting of granules of any desired uniform diameter. The vessel of the centrifuge is filled to a definite height, say 10 cm., with the emulsion in water; the machine is turned at a definite speed, say 30 turns per second (corresponding to a centrifugal force 500 times greater than gravity). After a definite time (say 60 minutes), the motive power is cut off and the vessel allowed to slow down gradually. A jelly-like mass now occupies the bottom of the vessel, consisting of the aggregation of granules which have reached the bottom in the centrifuging process. Let a_1 denote the radius which a granule, initially at the surface, ought to have to reach the bottom at the moment centrifuging is stopped. All granules larger will, therefore, be found at the bottom of the vessel. But there will be present at the bottom some particles smaller than a_1, which, owing to their being originally present in the lower layers of the emulsion, have had time to reach the bottom. The supernatant liquid will consist of particles smaller than a_1. By means of a syphon these particles may be removed. The vessel is filled with distilled water to the original height, the sediment being well stirred to form once more a uniform emulsion. The centrifuging process is repeated in exactly the same way, and so on again and again, until finally the supernatant liquid is perfectly clear. All particles of radius less than a_1 have thus been removed. Now recommence operations on this sediment, but with a slightly shorter time of centrifuging. The supernatant liquid will then contain no particles of radius greater than a certain value a_2, whilst, clearly, none can be present of radius less than a_1. By choosing the interval of centrifuging so that a_1 is very nearly equal to a_2 a practically uniform emulsion is obtained.

(*ii.*) *Distribution of the Granules.*—Having secured a uniform emulsion, Perrin proceeded to examine the variation of concentration in successive horizontal layers when equilibrium had been attained. A shallow cylindrical vessel of height about one-tenth of a millimetre is taken (the cells made by Zeiss for enumeration of blood corpuscles were found quite convenient), and in it a drop of the emulsion is placed, the top being closed in by a cover glass, which is then varnished round the edges to prevent evaporation. The preparation, carefully levelled, is then examined under a vertical microscope of very high power, in which case the depth of focus is small. Only those granules can be seen clearly which are contained in a very thin horizontal layer of thickness about 1 μ ($\mu = \frac{1}{1000}$ mm.) To count the number of granules in any layer two methods have been employed. The first is by instantaneous photography; this is, however, only applicable when the granules are relatively large. The second method is to place in the focal plane of the eyepiece an opaque screen of foil, in which a small circular hole is pierced. The field of vision is thus restricted, and the eye is able to take in at a glance the number of granules present at a definite instant (a maximum of five or six is best). A very large number of observations is made at a given level at equi-distant intervals of time, and the mean of these is taken. The level is then altered by a known amount, and the counting process repeated. Some thousands of readings are requisite to secure a reasonably high degree of accuracy. The concentrations of the granules in five equi-distant planes 25μ apart were obtained, the first plane being 5μ above the bottom of the vessel (to eliminate the possible influence of the boundary). To take one example from Perrin's numbers: In the case of granules of radius 0·14μ, the numbers of granules found were in the proportion 100, 116, 146, 170, 200, whereas the numbers required for geometrical progression are 100, 119, 142, 169, 201. The exponential law was proved to hold for gamboge particles of radius 0·14μ and upwards, and also in the case of an emulsion of mastic of radius 0·52μ.

(*iii.*) *Size of Granules.*—At first the law of Stokes was invoked. The emulsion was placed in a capillary tube sealed at both ends and installed vertically in a thermostat. With a fine tube convection currents are avoided, and the granules fall steadily like a cloud, with a fairly sharp upper surface; their rate of fall being measured by a horizontal microscope. Equating Stokes' expression $6\pi\zeta av$ to the apparent weight of a granule, $\frac{4}{3}\pi a^3(\Delta - d)g$, a is determined.

A second method consisted in counting all the granules present in a small volume of the emulsion. If the total mass of the granules present is known, and the density of each granule, the volume, and thus the radius, of each granule may be calculated. The counting is done in the flat cell already described, the bottom of which is divided into squares of 50μ side. The method depends for success on an observation made by Perrin that in a feebly acid medium the granules collect on the walls of the glass bounding the preparation. As soon as a granule touches the wall it sticks there. After a few hours, therefore, all the granules will have left the preparation and be found fixed to the walls. A camera lucida is then fitted to the microscope, and a copy made on paper of the squares and contained granules, first on the ceiling, then on the floor of the cell; whence the number present is easily obtained. The determination of the density is referred to below.

The total mass of gamboge (or mastic) in a given volume of emulsion is easily determined by evaporation of a known volume to dryness a little above 100° C. A glass-like mass is left whose weight remains constant, not altering even when the temperature is raised to 130° C. or 140° C. The determination of this weight furnishes the required datum.

A third method depends on the fact that the granules under the influence of acid often arrange themselves in rods composed of several granules. The length of these rods being measurable, and the component granules distinguishable, and therefore capable of being counted, the diameter may be estimated.

The three methods give concordant results, providing incidentally a valuable confirmation of the applicability of the law of Stokes to such small granules. The most careful measurements were made on a gamboge emulsion. By the second method, in which some 11,000 granules were enumerated, the radius 0·212μ was obtained, whilst by Stokes' law the value 0·213μ resulted.

(*iv.*) *Density of the Granules.*—We have seen that the mass of resin in a given sample of emulsion may be readily determined by drying in the oven. The density of the residuum is accurately found, and taken to represent the density of the granules.

§ 5. The exponential distribution being thus established, and all the requisite data obtained, the equation of distribution allows of the determination of N, and that with a high degree of accuracy. Perrin's mean result, based on several series of experiments involving the measurement of some tens of thousands of granules is that Avogadro's constant $N = 70{\cdot}5 \times 10^{22}$.

§ 6. Perrin's next step was to seek for *experimental confirmation of Einstein's formula*, according to which the mean displacement of a particle is a given time depends only on the size of the particle, and not on its chemical nature. Tiny metal globules and air bubbles should show the same degree of agitation if their sizes agree. The formula assumes the applicability of Stokes' law. Treating this assumption as justified by the measurements already described, a verification of the formula must be regarded as a vindication of the second proposition contained in that equation—namely, that of the equi-partition of energy among the particles. Two quantities require to be measured: First the radius, and secondly the mean square of the displacement in any definite direction in a given time. The former was determined as in the preceding investigation. For the measurement of displacement, the direction chosen by Perrin was a horizontal one; steady movement under the influence of gravity was thereby eliminated. The position of a selected granule was dotted in the camera lucida, the microscope being set vertical, four readings

Digitized by Google

being generally made on each granule at equi-distant intervals of half a minute. The square of any length being equal to the sum of the squares of the projections on any pair of rectangular axes in the same (horizontal) plane, the mean square of the displacement in any direction is found by halving the mean of the squares of the resultant displacement in the selected time.

The measurements, made under very different conditions, resulted in a satisfactory verification of the formula of Einstein. Thus, on increasing the viscosity of the suspending liquid to five times by the addition of sugar the displacement was reduced to the degree predicted. The law of variation with size was found to hold over a range of diameters from $0{\cdot}4\mu$ to 12μ. Taking the mean square obtained from over 3,000 displacements, the value $71{\cdot}5 \times 10^{22}$ was obtained for N.

§ 7. *Brownian Movements of Rotation.*—In the case of large spherical granules it is possible, owing to the presence of minute foreign inclusions, to observe persistent irregular movements of rotation, and even to measure their amount. Einstein has given a formula in this case, too, and Perrin's measurements go far to verifying the underlying assumption of the equality of the mean energies of rotation and of translation. Taking, for example, the case of spheres of mastic of diameter about 13μ in suspension in a solution of urea, the root-mean-square obtained from 200 angular measurements was 14·5 deg., whilst calculation predicts a rotation of 14 deg., in one minute.

§ 8. In conclusion, we have in the investigations on the Brownian movement a remarkable confirmation of a brilliant suggestion. Perrin's daring work can, indeed, be regarded as a triumph of experimental skill, and its outcome is an important contribution to our knowledge of some fundamental natural constants.

§ 9. *Other Related Work.*—Broglie and Ehrenhaft have made experiments on smoke particles electrically charged. Here, owing to the small viscosity of the surrounding air, the Brownian movements are considerably larger. In Broglie's work Einstein's formula was employed, and the value of N being assumed, the size of the particles was found. The photographic method was employed in the determination of the mean square of the particle displacement, which yielded for the value of $\frac{1}{\xi^2}$ in a time 3·5 seconds the number $0{\cdot}7 \times 10^{-5}$, leading to the value $a = 4{\cdot}9 \times 10^{-6}$ cm. Measurement of the steady speed of the particle in an electric field gave the value $v = 27{\cdot}5 \times 10^{-3}$ cm./sec. per unit field-strength. Applying Stokes' formula, we have for the charge on the particle $e = 6\pi a \zeta v$; whence the value $4{\cdot}5 \times 10^{-10}$ E.S. is obtained for e. Ehrenhaft, working with metallic particles, obtained the value $e = 4{\cdot}6 \times 10^{-10}$.

CORRESPONDENCE.

LIGHT AND SHADE IN INDIRECT LIGHTING.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: Mr. Hadyn Harrison appears, from his letter in your issue of the 30th ult., to consider that my assumption that the expression "indirect lighting," used in his article in your issue of the 9th ult., related to indirect lighting by either incandescent or arc lamps, is attributable to a "confusion of terms."

There cannot, I take it, be any question but that the term "indirect lighting," as generally applied, has for many years been recognised, not only by illuminating engineers but also throughout the electrical trade as relating to one or other of the few systems of lighting in which the actual light sources are screened from the eye, and the illumination on the working plane is obtained by reflection, and I, therefore, venture to submit that the "confusion," if such exists, lies rather at his door than at mine.

Mr. Harrison has, moreover, of late been somewhat unsparing in his condemnation of "indirect lighting," which he has, for instance, quite recently characterised as "always depressing," * and objected to "on the score of the absence of shadows." †

Is it to be understood that in each of these instances, also, the method of lighting which he had at the time in mind was the purely imaginary and hypothetical system which he now describes? If so, his statement to this effect is surely somewhat belated, and ought, under such circumstances, in common fairness to those interested in the sale and installation of both incandescent and arc lamps, to have been made considerably earlier.

Such an instance constitutes still another example of the class of statement—misleading by reason of incompleteness—to which exception was taken in my article. Mr. Harrison's statement that inverted arc lighting can hardly be considered indirect lighting, is, to me, a most remarkable one, and his further explanation that by the use of this expression he meant "illumination derived from all directions," makes the confusion worse confused, as in the room described in my article the

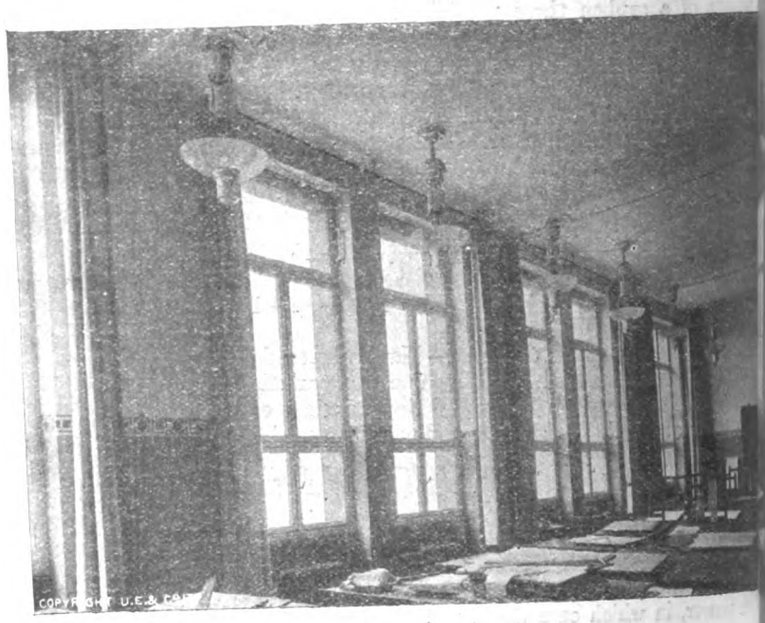

FIG. 1.—EXAMPLE OF INDIRECT LIGHTING IN AN OFFICE.

illumination *is* undoubtedly derived from all directions. If, however, what Mr. Harrison really means is illumination derived *equally from all directions*, which is quite another matter, then I unhesitatingly agree that this feature is neither possessed by this particular room nor by any other, with the possible exception of one constructed specially for the carrying out of photometrical measurements.

As regards the "light source giving equal candle-power in all directions," and the polar curve of which would in consequence be represented by a circle, if Mr. Harrison will be good enough to place such at my disposal I will arrange to have the experiments described in my article repeated in the manner he suggests; and by this means demonstrate to him that even with such a light source the light would not in practice be reflected equally by the ceiling, walls and floor, and the sphere would, in consequence, even under such circumstances, retain its appearance of rotundity.

Pending the advent of the light source in question, I can only state that using a single small incandescent lamp—selected as representing the nearest practical approach to Mr. Harrison's

* "Illuminating Engineer," May, 1911, p. 233.

† "Journal and Record" of Transactions of the Junior Institution of Engineers, June, 1911, p. 401.

Digitized by Google

theoretical source—suspended in the centre of a rectangular chamber, closed in on all sides and specially constructed of material having a high co-efficient of reflection, to represent to scale the room in which the latter experiments were carried out, the miniature sphere used was, when viewed through a small inspection opening, quite distinguishable, visually, from the flat disc, although under such circumstances a photographic representation of it could not, as stated in my article, readily be secured.

As regards the position of the arc lamp in the room shown in my illustration, I quite agree with Mr. Harrison that a closer approximation to daylight lighting, as regards the nature and direction of the shadows cast, would have been secured by placing the lamp nearer the windows and providing the latter with white blinds. The room in question was, however, specially chosen for the purpose of demonstrating the excellence of the results obtainable by the use of inverted arc lamps in ordinary rooms—*i.e.*, under possibly unfavourable conditions—the disc, sphere and statue being placed on the vertical centre line of the lamp rather than elsewhere in the room for the same reason.

Fig. 2.—Example of Indirect Lighting in a Studio.

The suggested position for the lamp is in no wise new, as the company with which I am associated has, when consulted in respect of such matters—in which, I may perhaps be permitted to state, they claim to be specialists—been in the habit of placing the lamps in such positions as to ensure the artificial lighting corresponding as closely as is practicable with the natural lighting, as, for instance, in the case of the two installations shown by the enclosed illustrations, which, although taken before the epoch of artificial light photographs, serve to show clearly the positions of the lamps in relation to the windows, and also the reflecting curtains with which the latter are provided. In both these installations the character, direction and ratio of the shadows are almost identical both by day and by night. May I also point out to Mr. Harrison that so far from approximately vertical shadows constituting a "curious effect very rarely found in nature," such are, in point of fact, the only shadows obtainable over a considerable area of the earth's surface, and that at 3:30 p.m. yesterday the shadow cast by a circular office stool 16 in. in diameter by 22 in. high (standing out of doors in the centre of a large yard in bright diffused daylight) was, whilst clearly defined, out of centre only to the extent of 2⅜ in.

Finally, I would state that I accept with pleasure Mr. Harrison's disclaimer of any intention to disparage indirect lighting by inverted arc lamps, and am delighted to welcome him to the ever-increasing body of experts, who, having seen the error of their ways, are now, very rightly, as strongly in favour of this particular form of illumination as they were, in their unregenerate days, against it.—I am, &c.,

Union Electric Co. (Ltd.), London, July 4. Justus Eck.

THE NOMENCLATURE OF PRIMARY AND SECONDARY SOURCES OF LIGHT.

TO THE EDITOR OF THE ELECTRICIAN.

Sir: While many scientific units are unsuitable for the measurement of engineering quantities, this hardly constitutes a reason for the choice of practical units which are unscientific. There is plenty of excuse for the pioneers of mechanical engineering for having bequeathed to us a heterogeneous jumble of units, many of which are unscientific and whose only claim to being "practical" is possibly the benefit which the engineer derives from the mental arithmetic involved. Such units, once established in practice, are extremely difficult to dislodge, and now that the subject of photometric units is open, it seems to me to be an excellent opportunity to put the whole matter on a footing which is both scientific and convenient.

Firstly, it is essential that the primary units of intensity and total light flux should be fixed, and that these should not be confused with each other. Owing no doubt to a slip, I notice that Mr. Trotter is actually made to state that "one candle-power is therefore the luminous flux per steradian," *i.e.*, intensity is flux! In common usage, however, the engineer absurdly specifies his lamps in watts per candle-power. Of course, we generally know that he means the mean horizontal intensity and leaves the rest of the polar distribution to chance. Hence we may actually have two lamps with exactly the same rating but giving quite different efficiencies when the total light flux emitted is compared with the power input. If the engineer is also a scientific man, he may have the temerity to ask for a figure comparing the total light flux, as measured by the mean spherical candle-power, with the watts taken, and, getting a true idea of the efficiency of the lamp, buy his lamp with the same scientific accuracy as he does his electrical energy. In other words, I object to candle-power or any other unit of intensity being used as a unit of light flux.

The unit of light flux at present most recognised is the lumen, which, I believe, Mr. Trotter intended to refer to as the light emitted by a source, having a uniform spherical intensity of one candle-power, in unit solid angle (or one steradian). To bring the purchase of light up to something like the same common-sense level as that which rules when dealing with other measurable commodities, we should rate our lamps in lumens per watt. From the definition above, it will readily be seen that the mean spherical candle-power is a direct measure of the light flux (lumens), but the term is confusing as it uses the term for intensity to express output.

Illumination, surface brightness and intrinsic brilliance are admittedly secondary quantities, but all of the same nature. Each may be defined in terms of the light flux emitted from a unit of surface, say, in lumens per square centimetre.

This method of definition is applicable whether the emitting surface be a white-washed ceiling or the filament of an incandescent lamp.

We may have a unit for these quantities and give it a name (say, for example, the lux*) which contains no reference to the method by which it is obtained. The engineer or architect knows that so many units of *illumination* are desirable for read-

* The lux is a unit fixed by the Geneva Congress, 1896; its magnitude is approximately $\frac{1}{12}$ foot-candle or 1/11,150 lumens per square centimetre.

Digitized by Google

ing or writing surfaces, or that the production of a certain *surface brightness* is necessary, or again, a light source having an *intrinsic brilliance* exceeding a certain number of these units should not be directly exposed to vision, if glare is to be avoided. It would probably be necessary to get a range of values almost as great as that required for the comparison of resistances of conductors and insulators, but the quantities are still the same in kind and the method is quite practical.

On the other hand, the expression of intrinsic brilliance in terms of candle-power per unit area involves a mathematic anomaly and, as Mr. Trotter shows, a practical difficulty. It also gives the engineer no means of comparing the brightness of a light source with that of an illuminated surface.

Mentally, I think that most people will compare the brightness of different surfaces directly, *i.e.*, simply state that one is so many times brighter than another, and if this has to be reduced to figures, surely it is much easier to think of the light coming from a certain patch of surface A as being twice as much as that from a similar patch of surface B rather than think that the illumination on A is produced by a hypothetical candle held say d feet away as compared with the same candle held $\sqrt{2} \times d$ feet away from B.

It therefore appears to me that all the units required are :—

1. A unit of intensity.
2. A unit of total light flux.
3. A unit comparing the light flux with the area of the surface emitting it.—I am, &c.,

East London College, June 26. LEONARD MURPHY.

"INTERNAL COMBUSTION ENGINES WORKING ON THE DIESEL PRINCIPLE."

TO THE EDITOR OF THE ELECTRICIAN.

SIR: On looking over your report of the discussion on Mr. Howard's Paper read at the recent Convention of the Municipal Electrical Association, I find that the report, either due to an error in reporting or the want of clearness on my part, does not, at one part, give correctly the views I at least intended to express.

Your report says: "Although no guarantees were given with Diesel engines, they had been found by engineers installing them to be as satisfactory in operation as steam plant, with which guarantees were regularly given." *Guarantees are regularly given by the makers of Diesel engines*, and the point I tried to bring out was that the guarantees given by Diesel engine makers very often appear to show results which are little or no better than the results to be obtained from gas or steam plant, judging from their makers' guarantees, but that, notwithstanding this, my experience had been that in every case there was a very substantial saving by the adoption of Diesel engines. I further explained that this was in no sense due to misrepresentation on the part of makers, but due to the fact that, whilst Diesel engines continue in daily practice to work up to the guarantee figures, this was almost impossible with other types of plant, and particularly with steam plant, as so much depends upon skilfulness of firing, and attendance, and on the condition in which furnaces, flues, and other parts are kept. A further reason which I mentioned was that the stand-by losses in small stations are relatively heavy, and with Diesel engines these losses practically disappear.—I am, &c.,

Stockport, July 3. CHAS. DAY.

SIXTEENTH ANNUAL CONVENTION OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION.

(*Concluded from p.* 475.)

On Friday morning members assembled in the Royal Pavilion, Brighton, for the annual general meeting of the Association, Mr. Christie presiding. The annual report of the Council was first read. The following is an abstract :—

ANNUAL REPORT OF THE COUNCIL.

The membership of the Association now stands at 407, made up as follows :—Committees (members), 168 ; chief electrical engineers (members), 187 ; honorary members, 4 ; chief assistants (associate members), 9 ; and assistants (associates), 39. There is a decrease of nine on last year's total.

The hon. treasurer's report shows that the nett result of the year's working is a surplus of £157 as against £93 last year, and a total surplus of assets over liabilities of £642. It must be borne in mind, however, that working expenses are very low, and that should it become necessary at any time to incur rent and other outgoings, the small margin at present in hand would soon be absorbed. This would also apply to any extraordinary expenditure which the Association might be called upon to incur in the way of Parliamentary work.

Two representatives of the Association, Messrs. Christie and Ayton, have been appointed as members of the Joint Publicity Committee, in addition to two members of the Council already members of such committee on a different representation, Messrs. Cramb and Seabrook. The committee have carried out a large business in poster and pamphlet work with good results, and the fact that a number of other municipal undertakings have recently joined testifies to the growing appreciation of the usefulness of the work carried on.

The Council have carefully considered and approved of the amended I.E.E. Wiring Rules, and consider it desirable that they should be adopted universally as a basis for standard practice.

This year two Papers were received from associates in competition for the travelling studentship. The Council has awarded the first place to the Paper on "The Motor Meter as Applied to the Measurement of Single-phase Alternating Current," the author of which is Mr. V. F. Bush, of Tunbridge Wells. The subject of the other Paper submitted was "Steam Power Generation : the Advantages of Mechanical Draft," the author of which is Mr. J. R. Campbell Murray, of Motherwell, to whom your Council has awarded a special premium of the value of two guineas. The Council consider both Papers to be meritorious, and they will be published in the "Proceedings" in due course.

As a result of a large number of meetings with representatives of the Municipal Tramways Association, a comprehensive and valuable report is now being dealt with by a committee, previous to its being considered by a joint committee of the two Associations.

During the year the Lamp Standard Sub-committee of the Engineering Standards Committee, upon which the Association are represented, has been engaged in the standardisation of bayonet socket lamp-holders and caps, and a standard specification has been issued. It is recognised that the ordinary standard bayonet socket lamp-holder is not well adapted for use with radiator lamps taking 250 watts at 100 volts, due to failure of the springs and contacts. The committee are therefore making further investigations in this direction. It is hoped that the result will be the production of a lamp-holder which can be used with uniform satisfaction with currents up to 2½ amperes.

In connection with the revision of the Institution of Electrical Engineers' form of model general conditions recommended for use in connection with contracts for plant, mains and apparatus for electricity works, particular attention has been drawn to a clause appointing the engineer (of the local authority) as sole arbitrator in cases of dispute. It is felt that this is a most unfair and improper clause, and your Council strongly urge the amendment of such clause in the preparation of all future contracts.

Finally, the membership shows a slight falling-off, due partly to the unusual number of engineers leaving municipal employ, but traceable also to the action of the Local Government Board in disallowing subscriptions paid to the Association by local authorities. This is a matter which the Council has under consideration. Other matters which are being dealt by the Council include the suggestion for the establishment of an information bureau and the desirability or otherwise of enlarging the Council with a view of securing wider representation of the smaller undertakings.

The election of officers for 1911-12 was next proceeded with. The following is a full list :—

President : G. Wilkinson (Harrogate).

Vice-Presidents : C. E. C. Shawfield (Wolverhampton) and R. A. Chattock (Birmingham).

Past Presidents : S. L. Pearce (Manchester), W. W. Lackie (Glasgow) and J. Christie (Brighton).

Council : W. Wyld (Birkenhead), A. C. Cramb (Croydon), F. Ayton (Ipswich), F. M. Long (Norwich), H. Richardson (Dundee), C. Furness (Blackpool), A. H. Seabrook (St. Marylebone) and S. J. Watson (Bury). Also, Councillor J. S. Rowntree (Harrogate), Bailie J. Willock (Glasgow), Councillor J. W. Crowther (Sheffield), Ald. W. Bruce (Sunderland), Councillor H. German (Brighton) and Ald. C. West (Coventry).

Hon. Solicitor : Ald. G. Pearson (Bristol).

Digitized by Google

Hon. Treasurer: J. E. Edgcome (Kingston-on-Thames).
Hon. Secretary: H. Faraday Proctor (Bristol).

Harrogate was selected as the scene of next year's convention, provided the necessary arrangements can be made.

The Press were excluded from the subsequent discussion on the obtaining of municipal wiring powers.

ANNUAL DINNER OF THE ELECTRICAL CONTRACTORS' ASSOCIATION.

The annual dinner of the Electrical Contactors' Association was held at Frascati's Restaurant on Monday last, the chair being taken by Mr. G. Harland Bowden, President of the Association. Mr. Bowden had been re-elected to the position of president earlier in the day, this being the second year he will have taken office. The gathering was not as well attended as in previous years, the reason being that a number of the members were away on holiday, and many of the provincial contractors who had attended the annual meeting had been compelled to return home earlier in the day. We understand that practically all the London members were present, but even these did not make the dinner in any way representative of the Association. It seemed to us that there was not more than 15 to 20 per cent. of electrical contractors present.

The CHAIRMAN apologised for the absence of Mr. Terrell, K.C., M.P., who was down to reply to the toast of the Houses of Parliament. That gentleman was compelled to be present at the House at the debate on the Declaration of London.

Mr. R. TWEEDY SMITH, however, made a useful speech in proposing this particular toast, and dwelt upon the necessity for the Association doing its utmost to check the advance of municipal trading.

Mr. H. H. BERRY proposed the toast of the Contractors' Association, and referred in pleasing terms to the fighting fund which has been got together to protect the interests of the Association.

The PRESIDENT, in reply, remarked upon the growth of the Association, its 20 per cent. increase of members during the past year, and the contributions to the fighting fund which had resulted from his tour of the country. They now had a good sum at disposal, and much of this had come from a certain source which he understood might be looked to for further supplies when required. Most of Mr. Bowden's remarks were confined to the question of municipal electricity departments trading on the business of the legitimate contractor. He regretted that no working agreement had been come to as a result of the conference, and he felt that as far as contractors were concerned they had done their very utmost; in fact, they had gone the whole way to meet municipal engineers. While he did not give up hope of some arrangement being come to, he felt that it was necessary for contractors to protect their interests against the abrogation of their rights by the municipal electrical departments. He thought that the matter would have to be decided ultimately by the British public, who would settle whether it was right that municipal authorities should enter private premises and practically take the place of the legitimate contractor. The contractor was a ratepayer, and the competition of the local authority was grossly unfair to him, as such. He felt that the Association had no further concessions that they could make. He looked upon Mr. Christie's presidential address to the I.M.E.A. as a sympathetic utterance, and, as far as he knew, the Association was quite ready to try again to put matters upon a satisfactory basis. The Association would require steadfastness of purpose, and the members would need a good deal of self analysis so as to get rid of a certain lack of cohesion which was noticeable, and so that a united front might be presented for the purpose in view.

Mr. W. R. RAWLINGS proposed the Institution of Electrical Engineers and the N.E.M.A. and kindred associations (the Institution figured in the toast list as the Institute), and spoke of the gratitude which the Association felt to the Council for facilities to use the new building on the Embankment. As far as he was able to gather, the manufacturers were the only people in the industry who were making any money. One of the questions that he particularly wished to ask was, When does the manufacturer become a contractor? and jokingly answered—When he becomes a consulting engineer. He looked forward to the Electrical Exhibition, and anticipated an increased demand on the part of the public for electrical apparatus as a result of the show.

The reply to this toast was a double-barrelled one by Messrs. L. B. Atkinson and F. H. Nalder. Mr. ATKINSON referred to the useful work which had been done by the Cable Makers' Association in the standardisation of cables and in the raising of the quality to a point beyond which it was difficult to go. He thought that the contractor was between the upper millstone of the consumer and the lower millstone of the manufacturer.

The proceedings were livened by an excellent musical programme. Among the contractors present we may mention Mr. A. Rashleigh Phipps, Mr. G. Fox, Mr. G. W. Strode, Mr. W. A. Shaw, Mr. E. G. Wallis, Mr. W. R. Rawlings, Mr. H. Marryat and Mr. L. G. Tate, the hon. secretary of the Association.

TELEPHONE TRANSFER BILL.

In connection with Part II. of this Bill a Memorandum has been issued which states that the conditions of transfer were originally set out in the memorandum read by Lord Stanley in the House of Commons on Aug. 9, 1905. (This memorandum is now again issued, and is set out below.) The conditions set out in that memorandum have since been considerably modified in favour of the employés. The conditions in the main will be carried out as matters of administration. Statutory provisions are, however, required to modify in favour of the employés in certain cases some of the provisions of the Superannuation Acts. The whole of the staff of the National Telephone Co. with two years' service (with the exception of those in receipt of £700 a year or more) will be taken into the service of the Post Office, without the imposition of any educational or medical test. The staff of the company with less than two years' service will also be admitted to the Post Office under the same conditions, subject to a satisfactory certificate of conduct and efficiency being forthcoming. Those who have not served with the company for a time equal to the probationary period imposed upon new entrants to the Post Office service will be regarded as on probation for the balance of that period. The transferred officers will, as far as possible, be placed in the same classes as Post Office servants doing similar work; and they will enjoy the advantages and be subject to the conditions of the classes on which they are placed.

Except in the case of any persons whose salary may have been abnormally increased by the Company during the two years preceding the transfer, the initial rates of pay under the Post Office will not be less, and in many cases will be greater, than those paid by the company. Service with the company will be regarded as of the same value as service on corresponding duties in the Post Office for the purpose of seniority, annual leave and sick pay. The classification of the company's staff on transfer is not yet finally settled; but it may be stated that the great majority of the members of the company's pension fund will be placed upon pensionable classes in the Post Office; and that many thousands of persons who are not members of the pension fund will also be placed on pensionable classes, thus acquiring pension rights for the first time.

All officers of the company will be allowed to count the last two years of service with the company as service in the office to which they are transferred for the purposes of the application of the Superannuation Acts, and it is proposed so to amend the bill as to admit of any shorter period of service also being so counted. It will be open to members of the company's pension fund, as an alternative, to assign their share in the fund to the Postmaster-General, and to secure the privilege of counting for those purposes the whole of the period during which they have subscribed to the fund, or, in the case of original members of the fund, the whole of their duly authenticated continuous service with the company. In the case of original members of the fund who are placed upon pensionable classes, and who have assigned their shares of the fund to the Postmaster-General, the pension granted on retirement at the age of 65 (including annual value of the lump sum awarded) will not in any case be less than two-thirds of the salary which they were receiving on Jan. 1, 1896—the amount guaranteed by the company under the pension trust deed. Those members of the pension fund who are not placed upon a pensionable class will receive an addition to their salary of not less amount than the total annual contribution at the time of transfer paid by themselves and by the company into the pension fund, and in the event of their being given at any time a higher salary in the service of the Post Office they will receive an addition calculated on the same principle so long as they remain unpensionable. The qualifying period of 10 years prescribed by the Superannuation Act, 1859, for the acquirement of pensionable status, and the qualifying period of five years prescribed by the Superannuation Act, 1909, for the grant of a gratuity on death, will be waived in the case of persons who have been in the company's service continuously since Aug. 15, 1904. This concession, of course, only applies to persons who are on transfer or subsequently placed on pensionable classes. Service during the years 1910 and 1911 will be taken into account in the calculation of marriage gratuities, provided, in the case of telephone operators, that only so much of this period shall reckon as is subsequent to the completion of two years' full time service as operator. This is in accordance with the established practice in the Post Office.

TRANSFER OF NATIONAL TELEPHONE CO.'S SYSTEM TO THE STATE.

MEMORANDUM AS TO COMPANY'S EMPLOYÉS, read by the Postmaster-General in the House of Commons on Aug. 9, 1905, during the debate on the Agreement for the Purchase of the Company's Undertaking.

1. Subject to the other provisions of this memorandum, the Postmaster-General will take into the service of the Post Office the servants and officers of the company who have been not less than two years con-

Digitized by Google

tinuously in the service of the company on Dec. 31, 1911, and such officers and servants shall enjoy the advantages and be subject to all the conditions of the rank or grade to which they are admitted in the same manner as other officers and servants of the Post Office in that rank or grade. This undertaking does not apply to the general manager or to officers of the company in receipt of £700 per annum or upwards.

2. The Postmaster-General has already by his agreement with the company conceded that officers or servants who have been continuously in the service of the company from Aug. 15, 1904, until Dec. 31, 1911, and who then become established servants of the Post Office entitled to pension, shall be so entitled, though they may retire before they have served 10 years under the Crown.

3. He is also willing, in the case of officers who do not participate in the pension scheme of the National Telephone Co., and who on the transfer of the company's business become established servants of the Post Office entitled to pension, to allow them to count for purposes of pension their continuous service with the company subsequent to Dec. 31, 1909, as service under the Crown.

4. As regards medical examination, the Postmaster-General cannot undertake to examine candidates for the Telephone Company's service, but he is willing to dispense in 1912 with the medical examination of any officer or servant if such officer or servant has been in the service of the company continuously for two years on Dec. 31, 1911, and has had no abnormal amount of sick leave during that time.

5. The pension fund of the company is in the hands of trustees, and its administration depends upon a private trust deed. The provisions of the deed are so different from the conditions of the Civil Service pension system that (apart from other difficulties) it would be impracticable for the Postmaster-General to administer the fund or to continue the same system for individuals. For instance, under the trust deed no pension can be granted to an officer who retires under the age of 65, whereas under the rules of the Civil Service an officer may be called upon to retire at 60, and if retiring at 60, either compulsorily or voluntarily, is entitled to a pension. The fund must, therefore, be closed, and officers and servants entering the Post Office must be subject to the Civil Service rules as to pensions (subject to the provisions of this memorandum). If, however, it be shown that by the closing of the company's pension fund and the substitution of the system of Civil Service superannuation the general body of the participants in the pension scheme of the company will be placed in a substantially less favourable position, the Postmaster-General will consider the expediency of adding a period (not exceeding in any case two years) to the service which under the rules of the Civil Service the officers affected are entitled to count for purposes of pension.

6. These arrangements cannot be fully carried out without the authority of an Act of Parliament, and this declaration is made subject to the passing of such an act. An act will be necessary to provide the money for the purchase from the company, and provisions on this subject will be included in that measure.

Mr. S. Roberts has given notice that he will move that the Bill be committed to a Select Committee of five members, three to be nominated by the House and two by the Committee of Selection.

PARLIAMENTARY INTELLIGENCE.

SIDMOUTH GAS AND ELECTRICITY BILL.

The Select Committee of the House of Commons on Unopposed Bills passed the preamble of this bill on Thursday last. The bill had already passed the House of Lords. The Urban District Council opposed in order to get a purchase clause inserted, but as a clause was agreed upon the opposition was withdrawn. The bill gave power to the company to, from time to time, raise additional capital not exceeding £15,000. The share capital is £30,000. The House of Lords Committee refused the Council a purchase clause, but gave them a suspensory clause. The Council were, however, not satisfied with that, but the promoters had now agreed to give them a purchase clause instead of the suspensory clause.

CENTRAL LONDON RAILWAY BILL.

This Bill, which authorises the Central London Railway Co. to construct a short double line, half a mile in length, from Wood-lane station, and to make a junction with the authorised line of the G.W. Rly. Co. at an estimated cost of £145,896, came before a Select Committee of the House of Lords on Tuesday. The Bill was opposed by the Metropolitan Railway Co., but the promoters contended that their proposal would not prejudice the Metropolitan Company, as their line and the Central London Railway were not in real competition until they reached the City. It was suggested that the Metropolitan line was so congested between Baker-street and Liverpool-street that the company had difficulty in providing for its traffic, and they had threatened to reduce the number of through trains which the Great Western Co. now run over their line.

Sir H. Oakley (late chairman of the Central London Railway), Sir James Inglis (general manager and consulting engineer to the G.W. Co.), and Mr. Basil Mott, C.E. (one of the engineers to the Central London Railway), gave evidence in support of the Bill.

On Wednesday the opposition was withdrawn and the Bill was allowed to proceed.

NEWCASTLE-ON-TYNE CORPORATION BILL.

This Bill was passed by a House of Commons Committee on Tuesday.

Mr. CRIPPS, for the Corporation, said the parties concerned had met and an arrangement had been come to that was satisfactory to all. He asked the Committee to agree to the insertion of an addition to Clause 128B, which would confirm an arrangement between the Corporation, the Newcastle-upon-Tyne Electric Supply and the Newcastle & District Electric Lighting Companies. The Newcastle & District Co. were satisfied with the amendment. They had an agreement with the Newcastle Electric Supply Co. which involved the Newcastle & District Co. taking some part of the supply under the heads of an agreement scheduled from the Electric Supply Co. The new clause was introduced and agreed to.

New Acts of Parliament.—On June 30 the Royal Assent to the Metropolitan Electric Supply Co. (Acton District) Act was read.

National Telephone Co.'s Staff.—In the House of Commons on Friday the Postmaster-General stated that when he said he would extend the promise which Lord Stanley read in the House of Commons on Aug. 9, 1905, by agreeing to take over members of the National Telephone Co.'s staff, even although they had had less than two years' service with the company, it was not his intention to extend it also by promising to take over officers in receipt of £700 per annum and upwards who were specifically excluded from Lord Stanley's undertaking. No doubt among those officers there would be some not near the age of retirement whose services would be of value to the Department, and he should carefully consider any proposals they might make to him to enter the Post Office at salaries bearing proper relations to those drawn by senior officers already serving in the Department.

Anglo-Norwegian Telegraph Service.—In the House of Commons on Wednesday the Postmaster-General stated, in reply to a question, that in regard to the working of the State cable between this country and Norway, the payment to the Great Northern Telegraph Co. for working the Anglo-Norwegian telegraph service was at the rate of 1¾ centimes a word for every word transmitted, together with 1½d. per telegram in the case of those telegrams which are collected and delivered by the company. The formal agreement on the subject, which would cover the general relations between the Post Office and the company, was still under consideration.

Metropolitan Railway Bill.—This Bill, which is proceeding as an unopposed measure, was ordered on Wednesday to be reported to the House of Lords for third reading. The proposals of the Bill include the widening of the railway, the construction of a station at Mount Pleasant, and the construction of subways for passengers at Marylebone.

Provisional Electric Lighting Orders.—The House of Lords Committee on Unopposed Bills on Tuesday passed Bills to confirm various Provisional Electric Lighting Orders, including the Portishead, Cirencester, Salisbury, Rhondda, and Chichester (Extension to Westhampnett and Westbourne) Orders.—The House of Commons Committee on Unopposed Bills has passed the Donaghadee Electric Lighting Order Confirmation Bill.

Macclesfield & District Railless Electric Traction Bill.—The promoters have withdrawn this bill.

LEGAL INTELLIGENCE.

National Telephone Co. v. Postmaster-General.

On Monday the Railway and Canal Commission sat as a court of arbitration in this case in order to decide matters of difference arising between the parties in respect of the "suitability" of certain plant, &c., to be transferred and the admissibility of these disputed items to the list of subjects for which compensation was to be paid by the Postmaster-General to the company.

Sir Alfred Cripps, K.C., M.P., Mr. Danckwerts, K.C., Mr. E. Mortin, K.C., Mr. Forbes Lankester, K.C., and Mr. H. H. Gaine appeared for the company; the Attorney-General, the Solicitor-General and Mr. G. R. Branson for the Postmaster-General.

By a deed of Feb. 2, 1905, it was agreed that the Postmaster-General should buy of the company on Dec. 31, 1911, (1) all plant, land and buildings of the company brought into use with the sanction of the Postmaster-General and in use by the company on Dec. 31, 1911, for the purposes of the licensed telephonic business of the company; any licensed telephonic business of the company which by virtue of the Telegraph Act, 1899, or of any of the agreements in writing between the Postmaster-General and the company particularly specified in the first schedule, or of any other agreement in writing between the Postmaster-General and the company (whether made before or after the date of the agreement), can be transacted for any period after Dec. 31; any private wire business of the company, together with all plant, land and buildings in use by the company on Dec. 31; all stores which on Dec. 31 are in the company's possession and which are suitable for use in accordance with the methods of work described in the specification and rules set forth in the third schedule, and all furniture in the company's possession at the same date, provided that they are reasonably necessary for the purposes of the telephonic business of the company according to the ordinary and businesslike way of carrying on such business. (2) Spare plant of every description in the company's possession on Dec. 31 (in-

Digitized by Google

cluding works of all kinds in course of construction at that date shall be deemed to be plant in use by the company on Dec. 31 for the company's telephonic business. The above was subject to the provision that no exchange which had a capacity of more than 300 direct subscribers' lines, the construction of which was commenced after Aug. 15, 1904, should be deemed to have been brought into use with the sanction of the Postmaster-General unless its site and capacity should have been approved in writing by the Postmaster-General, or unless at the time when the question arose it should be determined by arbitration that such exchange would be suitable for the requirements of the telephonic service of the Post Office on Dec. 31, 1911. The Postmaster-General might, by notice in writing, given to the company not later than Jan. 1, 1911, object to buy such plant, &c., as he considered unsuitable for the actual requirements of the telephonic service of the Post Office. Save as otherwise expressly provided by the agreement, all questions and matters of difference under the agreement shall be referred to the Railway and Canal Commission.

Notices were given by the Postmaster-General rejecting certain plant, &c., and differences had arisen between the company and the Postmaster-General with reference to those notices; the company contended that the notices did not comply with the requirements of clause 3 of the deed, and also that the notices were in such a form as to include plant, &c., which would be in use by the company on Dec. 31, wholly or in part for the purposes of the private wire business of the company, and that under the agreement the Postmaster-General was bound to buy all plant, &c., in use for such business or which could not be separated from such plant, &c., without destroying or prejudicially affecting the same, and in that respect also the notices were void. The company asked the court to say that the notices of objection were void, and that all plant, &c., specified in the notices would be suitable for the telephonic service of the Post Office.

Sir ALFRED CRIPPS, in opening the case for applicants, said he wished to deal with the question on its merits, and he and his clients had very carefully considered how the case might be dealt with so as to bring the hearing within reasonable limits. He then read the judgments of the Court of Appeal upon the point of unsuitability, in the course of which the Master of the Rolls suggested that it might be possible for the parties to resolve the various plants and properties about which differences had arisen into categories, and so dispose of them en bloc. He (Sir Alfred) looked upon that view as optimistic. He pointed out that the judgment of the Court of Appeal, in dealing with the one point of "suitability," failed to take into account the case of a cable which could not be separated but which possessed a degree of suitability. Those cables could not be left out of account when the question of compensation came up for consideration before the court.

The ATTORNEY-GENERAL asked what he meant by some degree of suitability.

Sir ALFRED said it was a cable in which some of the wires were "suitable" for the purposes of the Postmaster-General and some unsuitable. He thought their lordships would come to the conclusion that that should be taken into consideration in estimating the compensation to be given to the company.

Mr. Justice A. T. LAWRENCE: Your argument is that in such a case as you give in illustration there must be a question of a quantum price, to be settled afterwards.

Sir ALFRED CRIPPS: Yes, my lord.

Sir JAMES WOODHOUSE inquired whether the case of private wires entered into Sir Alfred's illustration.

Sir ALFRED said he did not wish to exclude them from consideration, if the court came to the conclusion that a certain number of wires in a cable were suitable for and required for the service of the Postmaster-General.

Sir JAMES WOODHOUSE: Your opinion is that if some of the wires in a cable, according to the evidence to be given, turned out to be suitable and others unsuitable, the whole cable must not be refused on account of the unsuitable wires embraced in it?

Sir ALFRED CRIPPS agreed, but added that if it turned out in any case that the wires were easily separable that difficulty would not arise. It was where suitable and unsuitable wires were joined in one cable in an inseparable condition that he claimed the consideration of the Commission for the "suitable" wires as fit subject for compensation. The Government had given four typical cases to the company, which, if they were to embrace the whole of the Government's case, might shorten the proceedings considerably.

The ATTORNEY-GENERAL said these cases were typical of the Government case at large, but he could not be held to assenting to the proposition that there were no cases falling outside of them.

Mr. FRANK GILL, engineer-in-chief of the National Telephone Co., said that since he had been engineer-in-chief of the company he had added [illegible] stations to the system and 542 new exchanges. About 68 per cent. of the company's lines were now underground, and all of the work had been constructed in the most approved and modern style. The notices served by the Government upon the company were so wide that no two competent engineers could have agreed upon their meaning. There were in all 93 exchanges belonging to the Post Office and the telephone company in the London area, of which 61 belonged to the company. On Dec. 31, 1910, there were 118,596 exchange lines in that area altogether, of which 70,709, or nearly 60 per cent., belonged to the company. The total number of exchange stations was 194,003, of which 122,680 belonged to the company. In his opinion a considerable portion of the plant at the Avenue exchange ought to be maintained and utilised whatever the Postmaster-General's intentions might be. In the case of some of the notices it would be impossible to apply them for physical reasons, and in other cases they would amount to a ridiculous destruction of plant. In his opinion the company had in substance no superfluous plant. Cables used for connecting condemned exchanges could not be done away with without interfering with other lines of communication passing through and beyond the area of those exchanges. In many cases within the London area separation between condemned lines and useful lines would be impossible. Into the Gerrard exchange, to which, he understood, no objection had been taken, 33 cables entered, each carrying 600 pairs of wires, or an aggregate of 19,800 pairs. In 13 of those cables there were 496 lines connecting Gerrard with exchanges which had been objected to. Those cables, however, were not separable, because none of them contained only condemned wires. Most of the company's cables contained spare wires; those wires were not more than was necessary, and were not separable from the other wires in the cables.

On Tuesday Mr. GILL made a correction in his evidence. He stated that the number of exchanges in London operated by the Post Office was 33 (and not 31), and those operated by the company was 62. He had neglected to include the Treasury and the official switch as exchanges under the Post Office. There were 3,538 junction lines affected by the notices of rejection. These lines were about 17,000 miles in length, and on those there were about 2,747 calls per day. In his opinion the junction lines between the various exchanges were necessary for the public service. As to the necessity for those junction lines, witness gave as an instance the Croydon exchange, one of the 21 concerning which notices of rejection had been given. Between Croydon and exchanges not objected to there were 211 junction lines, and between Croydon and exchanges objected to there were 76. In addition, 35 junction lines passed through Croydon without using the Croydon switchboard. 211 of those lines were connected with exchanges not objected to, but because they originated with Croydon they would be objected to.

Mr. Justice LAWRENCE suggested that some method might be arrived at of avoiding the necessity for entering into so much detail. The Government thought they could not make their objections plainer in their notices, and, as things were, he did not see how the Court could get at the facts.

Sir JAS. WOODHOUSE said it appeared to him that what was really wanted was some scheme whereby the Post Office could show how the things they proposed to object to must come within the terms of the deed.

The SOLICITOR-GENERAL said he was anxious to save the time of the Commission, but the agreement was one under which they bought what they wanted, and they indicated what they wanted by the process of exclusion. It was not for them, but for the company to explain their position.

Sir ALFRED CRIPPS said his evidence was that not only on the question of "suitability," but on the question of "need" under clause 3, there was the question to be considered of an inseparable piece of plant. If the plant was suitable at all, in however small a degree, or if it were wanted at all, then, according to the view of the company, and, as he believed, of the Court of Appeal, if he appreciated its decision rightly, such plant could not be ruled out from the case under arbitration. By and bye, when they came to determine prices, the degree of suitability and the degree of need might be important matters to consider. But what he had shown was that all those lines had, of necessity, elements of suitability, and could not be ruled out at this stage.

Mr. GILL stated that the company had 880 instruments of the central battery type connected with the 21 London exchanges objected to by the Post Office. There were also 6,852 convertible instruments which, by quite a minor alteration, could be made practically central battery instruments. In addition, there were 13,266 instruments of the local battery type. All those could be made at a very small expenditure available for use on a central battery system. The local battery when used in connection with a central battery exchange would still receive its energy for speech from the battery in the subscriber's office, but the method of communication would be greatly simplified, so that the mere removal of the telephone from the hook would call the exchange, instead of having to ring. Witness gave the result of certain calculations made by him, which he said showed that the central battery system of the National Company was more economical than the magneto system. That central battery system was very suitable for the use of the Post Office, and he understood that the Post Office authorities intended to adopt the central battery system in some of its exchanges. Any attempt to replace the 21 London exchanges objected to by Dec. 31 would be likely to work an injury to the public service. Such a change could not be effected in a short time and ought not to be tried. In witness's view, substantially all the plant covered by part 1 of the notice was suitable for the working of the combined system. In the few instances where iron wires did exist they were suitable for the work. In one case, a very windy place, the ordinary copper wire was not stout enough, and, with the consent of the Post Office itself, the company put up an iron wire there, and it was doing its work well. In such a case as that he was prepared to argue that iron wire was suitable. There were only 86 miles of iron wire circuit belonging to the company, and of those 29 miles were especially arranged with the Post Office. He thought all the company's overhead wires would be suitable for the combined system. In only one case (at the Bank exchange) they had any difficulty with their telephone lines laid on or across or along a railway driven by electric power. All their cables laid in the proximity of electric railways were suitable for their work.

Cross-examined by Sir J. SIMON, witness said that in a place like London the central battery system was superior to the magneto system. If he were planning a new system he would have a central battery system. It was probable that had the company's business not been coming to an

Digitized by Google

end shortly they would have gone much further in substituting the central battery system for the magneto system.

On Wednesday the Attorney-General said the parties were considering if some means could be devised for shortening the inquiry. He also suggested that in a matter of that great complexity counsel ought to have a spare day in order to examine the notes and submitted that taking that into consideration the court should not sit on Saturdays.

Mr. Justice LAWRENCE said he thought that it was reasonable to have a day. He ordered that there should be no sitting on Thursday this week, and that the court should not sit on Saturdays.

The SOLICITOR-GENERAL then resumed his cross-examination of Mr. GILL, who said there was more of the company's system in the City overhead than underground, and so far as it was an underground system in the City it was substantially because it used the underground system of the Post Office. Leaving out the underground system that they had hired or leased, the Post Office system was an underground and the company's an overhead system. He thought the Post Office had a very complete underground system. It would be necessary for the public service that the P.O., when it took over the business of the company, to lay down more underground wires in small lines in side streets, but the main arteries were fairly covered. He knew that the P.O. was now, and had been for some time, engaged in connecting the company's subscribers with its own main lines and installing its own instruments. Witness said that, as a matter of choice, he preferred an underground to an overhead system in the interests of economy. He mentioned certain underground cables laid by the company in Kensington.

The SOLICITOR-GENERAL said the P.M.G. was not only willing, but desirous of taking over that part of the company's property. He was authorised further to say that the P.O. made no objection to taking over any part of the company's underground system and plant laid in the public streets in London, but not those laid on private property. He desired especially to guard himself against being supposed by that to waive the objections of the P.O. to lines laid along the electric railways.

The SOLICITOR-GENERAL inquired what was the voltage of the current on an electric railway?—Witness said he believed, in the case of the District Railway, it was 500. An ordinary central battery worked at 24 and the ringing battery up to about 120 volts.

Counsel asked whether there would not be danger of shock to a subscriber if a voltage of 500 came along his telephone wire while he was using it, and witness said the probability was that it would burn the fuse wires.

With reference to the separability of wires in the cables, Sir John asked if it were witness's contention that the presence of a single pair of private wires in a cable threw upon the Post Office the obligation of buying the whole cable?—You are asking me a legal question which I cannot undertake to answer. All I say is you cannot separate the wires.

With regard to part 2 of the London agreement, witness said that, although the company had had certain non-metallic circuits, most of them were removed. He was, however, prepared to argue that those which were left were suitable for their purpose.

The SOLICITOR-GENERAL said that in cases where the company had copper-covered wires with an iron core the Post Office did not offer any objection to such wires on the ground that they were bi-metallic. Of course, they might have such wires overhead running from a condemned exchange, but that was another matter. With regard to want of audibility Sir John informed the court that the P.O. did not want to take advantage of any temporary want of audibility, but they desired to reject plant where the want of audibility was due to constructional difficulty.

On the question of the comparative efficiency and economy of the local battery and the central battery systems, witness agreed that the central battery system was generally more economical because fewer operators were required to attend to a given number of calls. That, however, was not always the case; for instance, he did not think the company could work the Avenue Exchange, London, any cheaper, and he was quite sure the P.O. could not.

The hearing was adjourned until to-day (Friday).

Workmen's Compensation.

At the County Court, Alfreton, last week, Judge Lindley sat as an arbitrator to determine an application by John Fearn for compensation in respect of injuries received at Wingfield Manor Colliery on Feb. 6. It appeared that Fearn worked an electrically-driven coal-cutter and during a mishap with the machine he was alleged to have received an electric shock, sustaining bad injuries, from which he now suffered. The accident was the subject of a police court prosecution at Alfreton, when Fearn was fined for working the machine with three wires in the fuse carrier. The magistrates held that he ought to have detected the presence of the wires by an examination, as required by the rules of the colliery. The man's wages were agreed upon at 38s. 11d. per week.

FEARN denied that he knew there were three wires in the fuse carrier when he was working the machine. He said he had remedied similar defects often.

SAMUEL JONES, of Wessington, formerly electrician at the colliery, said the accident was caused by a defect in the machine and not by reason of there being three wires in the carrier.

Respondent company's witnesses said that if there had been only one wire instead of three in the fuse carrier the accident could not have happened.

His Honour held that the accident occurred by reason of the fact that there were three wires in the carrier, and he was of the opinion that that amounted to serious misconduct on the part of Fearn. He therefore dismissed the application with costs.

W. Canning & Co. v. Northern Metallic Flexible Tube Co.

The hearing of this action was continued by the Official Referee (Mr. Muir Mackenzie) last week.

Mr. S. COWPER COLES gave evidence for the defence. He said he had examined the plant at Bradford. The dynamo was too small and the galvanising tank was wrong from the mechanical point of view. The wear and tear of the working parts was so excessive that it was impossible to keep the plant working continuously. The plant was also faulty from an electrical point of view.

In the course of the cross-examination of the witness, Mr. WAUGH, K.C. (for the defence) asked for an adjournment, to enable his clients to consider the position. On reassembling, it was announced that the parties had come to terms, which were not mentioned publicly, and Mr. Mackenzie made an order in accordance with these terms.

Tampering with Electric Apparatus.

At Barnsley Police Court last week John Tayler, a rope lad, was fined 10s. and costs for interfering with electrical apparatus at the Wharncliffe Silkstone Colliery. It was stated that defendant had left his ordinary work and interfered with the electrical apparatus to his own imminent danger.

W. Potts v. Metropolitan District Railway Co.

At the Westminster County Court on the 29th ult. Judge Woodfall granted a new trial in this case. As reported in THE ELECTRICIAN for June 23 (p. 434) a jury awarded plaintiff £50 damages for an "electric shock" alleged to have been received by him on the platform at Putney railway station.

Factory Prosecution.

At West Ham Police Court on Wednesday the Charing Cross, West End & City Electricity Supply Co. were summoned at the instance of Mr. W. Williams, Home Office factory inspector, on five informations for failing to comply with the regulations of the Factory and Workshop Act.

Mr. WILLIAMS said that the proceedings were under the electricity regulations of the Factory and Workshops Act, which came partly in force in 1909 and wholly in January, 1910. Those were the first proceedings under the Act. The facts were that on April 13 last there was a bad accident at the company's generating station. Geo. Charles Avent, a competent man, went behind the switchboard, and while there he received an electric shock, the voltage being 10,000. It was one of the few cases on record in which a man suffering from such a shock was alive to recount it, but he lost the use of his left arm, which was amputated.

The man gave evidence, and said that he had been employed at the company's station for 6½ years. On April 13 whilst cleaning the insulators at the back of an interlocking switch he got the shock and did not remember anything else.

Mr. LANE, for the defence, urged that Avent was acting contrary to the instructions of the company in entering the chamber. If he had asked, the current would have been cut off.

Mr. GILLESPIE said that from the man's own statement it appeared that he had no instructions to do that particular work.

Mr. WILLIAMS said that the object in bringing the case was that the regulations should be strictly observed, and with the consent of Mr. Gillespie he withdrew the summons.

COMMERCIAL AND INDUSTRIAL SECTION.

MUNICIPAL, FOREIGN & GENERAL NOTES.

BRITISH NOTES.

Accrington.—The Electricity Committee have made an arrangement with Messrs. Howard & Bullough for supply of an additional 300 kw. for power. The agreement is for five years, and the firm undertake to pay for at least 500,000 units per annum.

The Board of Trade have sanctioned the laying of e.h.t. mains to the Rexenden boundary and also the supply of electricity in bulk to Haslingden Corporation.

Aldershot.—An inquiry was held last week into the Council's application for sanction to a loan of £2,500 for additional plant at the electricity works.

Evidence was given by the clerk to the Council (Mr. W. E. Foster), the chairman of the Lighting Committee (Mr. Calvert) and the electrical engineer (Mr. F. Gastide). Technical details were given by Mr. GARSIDE, who said that they anticipated by the installation of Diesel engines to be able to economise in their coal bill in the day time, and supply their large power consumers more cheaply. It was also necessary that they should increase their plant for the winter load. The department had in view a big contract to supply electricity, and it was quite possible they would get more, explained the engineer.

Applications for Restoration of Patents.—The Saltpetersäure Industrie Ges. (G.m.b.H.) have applied for the restoration of Patent No. 7,320/1907, for "Improvements in arc furnaces for the electrical treatment of gases," which expired on July 6, 1910, owing to non-payment of renewal fee.

Samuel Marsh Young has applied for the restoration of patent No. 13,746/1903, for "Improved method for operating signals on electric railways," which expired on June 19, 1908, owing to non-payment of renewal fee.

In both cases notices of objection (on Patent Form 16) must be sent by Aug. 28 to the Patent Office, 25, Southampton-buildings, London, W.C.

Asylum Lifts.—At the meeting of the Metropolitan Asylums Board on Saturday, the Asylums Committee recommended that in each of the two most recently-erected blocks for patients at Tooting Bec Asylum there be provided an electric lift capable of carrying 5 cwt., at an estimated cost of £210 per lift. It was stated that the hand lifts in the older blocks were so cumbersome that they were rarely worked unless absolutely necessary.—Agreed.

Barking.—The Council have deferred the consideration of the proposed extensions of the electricity generating plant and the L.G. Board have been asked to postpone their inquiry into the application.

Bath.—The Electric Lighting Committee recommend the Council to apply for sanction to a loan of £400 for a booster in connection with the supply of current to the Lower Bristol-road district.

Birmingham.—On Saturday the tramways running to Handsworth and along the Bristol-road to Selly Oak and King's Norton passed from the possession of the City of Birmingham Tramways Co. to that of the Corporation, and for the future they will be worked as part of the Corporation tramway undertaking.

In order to avoid delay the substitution of electric traction for the cable system has been effected in advance. The overhead work was completed and the track, which is to be used temporarily, has been bonded, and the cables supplying the electric energy have been laid by the Tramways Committee so far as the city portion of the line to Hockley Brook, and by the Handsworth Council on the remaining part. The route was officially inspected by Col. Yorke on Saturday.

Blackpool.—Application is to be made for leave to borrow £2,000 for four new tramcars of the toast rack pattern, two for this season and two for next year.

Brighton.—Rail-less Traction.—The Lighting Committee have increased the salary of the deputy manager of the electricity department (Mr. C. C. Fowler) from £350 to £375, with an increase to £400 at the end of 12 months. The salary of the chief clerk (Mr. G. T. Joyce) has been increased from £250 to £275, to be further increased to £300 in 12 months.

The Tramways Committee recommend that the members be authorised to visit Leeds to inspect the rail-less trolley system there and the question of applying for powers to establish a similar system in Brighton and along the Preston road to Patcham will be considered at the next meeting of the Committee

British Empire Trade Products.—A special supplement to the "Chamber of Commerce Journal" for July contains interesting information and statistics relating to the resources of the British Empire as a supplier of foodstuffs and also of raw materials for industrial purposes.

The statistics show the extent of the production in each colony and the condition of its development. Manufactured goods, other than food products, are not dealt with, and the figures relating to the imports to the United Kingdom are taken from the annual statement of the trade of the United Kingdom for 1910, and the statistics relating to trade and productions in British Possessions are mainly from official publications of the countries concerned. The products dealt with include rubber, gutta percha, gum arabic, lac, varnish, resins, &c., minerals and metals (including copper, nickel, tin, iron ore, manganese, zinc, asbestos, graphite, mica and asphalte), timber, fibres, &c. All who are interested in the development of trade within the Empire should procure a copy of this interesting supplement.

Croydon.—The Council have decided to re-open the Whiteboreroad tramway route.

The salary of the borough electrical engineer (Mr. A. C. Cramb) has been increased from £600 to £650, rising to £800 by three annual increments of £50. The salary of the Assistant Borough Electrical Engineer has been increased to £325, with a further increase of £25 in 12 months.

The charges for electric current are to be reduced as follows: For public lighting the price per lamp per annum for high candle-power lamps to be reduced £1 per lamp; for private lighting the flat rate of 4d. to be reduced to 3½d. per unit; heating and cooking from 1½d. to 1d. to consumers using electric light; traction from 1½d. to 1d. per unit for all current consumed in excess of 2,000,000. The charge for current for outside shop lighting has also been reduced, the total reductions representing a loss of £4,105 in revenue.

The accounts of the tramways department were approved on Monday.

Derby.—At the meeting of the Corporation on Wednesday the chairman of the Electric Lighting Committeee (Ald. Butterworth) announced that the profit on the electricity undertaking last year was £1,770, after paying all expenses, including interest, and paying nearly £12,000 to sinking fund account.

Dublin.—The L.G. Board have sanctioned a loan of £50,000 (out of the £128,129 recently applied for) for the electricity supply department. The question of granting power to borrow the remainder is under consideration.

Eccles.—Sanction has been received to a loan of £3,294 for a 500 k.v.a. steam alternator, &c., at the electricity works. The period of the loan is 18 years.

Edinburgh.—The Electric Lighting Committee recommend that current be supplied free of charge to the committee which is arranging the illuminations of the city during the Royal visit.

The committee also recommend a further reduction in the price of current to users of power. Previously the committee had recommended the reduction for private lighting from 2⅞d. to 2¾d. per unit. The applications for the use of electricity from May 16 to June 21 were equivalent to 11,512 8-c.p. lamps.

The Burgh engineer has been authorised to inspect and report upon the railless trolley systems recently inaugurated at Bradford and Leeds.

Electricity in Gas Works.—Perth Gas Committee recommend the Council to instal an electrically-operated stoking plant at a cost of £3,900.

The CONVENER (Coun. Clark) states that the claims which have been made for the new type of machine have been more than justified by the results obtained in other works. In Perth they were faced with the introduction of electric stoking machinery, or the alternative of an expenditure of £370 to £400 in repairs, a large proportion of which could be saved by the introduction of the new plant. No part of the existing plant would be sacrificed in the event of electric stokers being adopted. The economies to be effected by the introduction of new plant would result in a gross annual saving of fully £1,000.

Gloucester.—An inquiry was recently held into the application of the Council for sanction to borrow £13,500 for the electricity undertaking.

Of the loan £1,168 was for excess of expenditure, £5,604 plant extensions, £3,405 main extensions, £3,405 sundry distributory extensions, £1,200 for 250 services (at about £5), and £323 law costs.

The electrical engineer (Mr. F. H. Corson) gave technical particulars of the proposed extensions, to which there was no opposition.

Digitized by Google

Heston and Isleworth.—Twickenham Electricity Supply Co. have arranged with the Council for a supply of current in the Whitton Park area.

Hornsey.—An inquiry was held last week into the Council's application for sanction to borrow £9,600 for extensions to the generating plant and mains.

The borough electrical engineer (Mr. N. Stainland) said that the demand for current was increasing at a satisfactory rate. The Borough Accountant said, in regard to the allocation of the profits, that it was desired to build up an adequate reserve and to reduce the price of current to consumers.

Kingston-on-Thames.—At the last meeting of the Council the Lighting Committee recommended that the chairman and vice-chairman, with the electrical engineer (Mr. J. E. Edgcome), should visit the Diesel oil engine works of the M.A.N. Co. at Augsburg and Nürnberg, and also, if possible, Munich, Dresden and Berlin.

Ald. MINNITT said they were shortly to have an electrical exhibition at Olympia, where they would be able to see types of every kind of engine, and he thought they should wait and see if they could get the information they wanted at Olympia.

Coun. SPRUNT said the Committee had now arrived at a point when the only question left to decide was whether they should adopt gas or oil engines. The expenditure they would have to incur shortly on the new engines would, probably, be £8,000 and it would be false economy for the sake of £40 or £50 not to get the best information concerning the engines first hand. The firm who made these engines employed 12,000 hands. They had made visits to various places, and they found that they could supply motive power which produced electricity much cheaper than their present plant.

Coun. LAMBOURN, replying on the discussion, said the committee suggested that Mr. Edgcome should go alone, and it was only on his strong representation that it was decided that two members should accompany him. They would certainly give a preference to English made goods if they were the best.

In response to requests from members, Mr. EDGCUMBE said the question of the engines was left an open one. The Committee had seen a number of gas and oil engines. There were two types of Diesel engines being made by four companies in this country, but the M.A.N. Co. turned out five times more than any other firm, and for engines of over 200 H.P. they adopted a type of which there were none at work in this country. Possibly, the double plant would involve an expenditure of from £8,000 to £10,000, and he thought it was only fair to himself that he should be supported by two members of the Committee.

The recommendation was carried.

Leeds.—On Wednesday a proposal of the Tramways Committee to purchase for £31,550 land for new tramway offices was referred back by the Council.

Leeds-Morley Tramway.—The new tramway between Leeds and Morley was formally opened for traffic on Wednesday.

Light Railways.—The Morley Corporation Light Railways Railways Order has been submitted to the Board of Trade for confirmation. This Order amends the Morley & District Light Railways Order, 1901. Objections must be lodged by July 28.

London County Council.—On Tuesday sanction was given to the borrowing of £11,236 by Shoreditch Council for electricity purposes. The report dealing with workmen's cars which was submitted at the last sitting was again adjourned.

L.C.C. Tramways.—Poplar Borough Council have been informed that the London County Council intend to proceed with the extension of the tramways in the East India Dock-road, from the existing terminus to the county boundary at Barking-road Bridge.

Maidstone.—Ten standards in Tonbridge-road are to be fitted with Osram lamps, thus effecting an annual saving of about £25 in the cost of lighting. The question of the cost of street lighting is to be considered at a joint meeting of the Electricity and Highways Committees.

Presentations.—Farnworth electricity works staff have presented a marble timepiece to Mr. A. J. Hutchinson, engineer and manager, on his marriage.

Last week the staff of Ealing electricity works presented a watch to Mr. Richard Golding, shift engineer, who is leaving to take up a position in Australia.

Provisional Order Revocation.—The Board of Trade have revoked the Higham Ferrers, Rusden and Wellingborough (Rural District) Electric Lighting Order, 1906, as from June 29.

St. Pancras (London).—The action against the National Telephone Co. to recover the cost (£180) of repairing the damage to the Council's mains, &c., in Upper Woburn-place by the company's workmen, has been settled, by the company paying the claim, each party bearing its own costs.

Salford.—Application is to be made to the L.G. Board for sanction to borrow £3,000 for mains and services in Prestwich.

In accordance with the recommendation of Sir Alex. Kennedy, alterations of the cut-offs of the generating engines at the electricity works are to be proceeded with at a cost of about £20 per engine. Tenders are to be invited for supply and fixing a new boiler.

Stoke-on-Trent.—At the last Council meeting a discussion arose in regard to a letter from the Potteries Electric Traction Co. inviting the Council to enter into negotiations for the purchase of their tramway power stations. The matter was referred to the General Purposes Committee.

Teignmouth.—Messrs. J. & W. Purves have notified the Council that they will apply for a provisional electric lighting order.

Torquay.—An inquiry was held on Tuesday into the Council's application for sanction to a loan of £5,000 for additional generating plant.

The town clerk (Mr. F. S. Hex) and the borough electrical engineer (Mr. C. W. Salt) gave evidence in support of the application. Mr. Salt supplied technical details of the plant in the generating station and of the proposed new plant. In the £5,000 asked for there was no sum for contingencies, and the inspector (Mr. H. R. Hooper) suggested that there should be a small sum allowed for that purpose, as it would be difficult to get the work done at the station for exactly the sum stated. Accordingly £250 was added for contingencies.

Willesden.—Sanction has been received to a loan of £5,000 for mains and £3,000 for services.

Worcester.—For outside shop lighting a special charge of 3d. per unit is to be made. The graduated fixed charge for heating and cooking has been abolished, leaving the 1d. per unit charge with a nominal charge of 1s. 3d. per quarter for the hire of the meter.

York.—Tenders are to be obtained for supplying and laying a cable to Messrs. Rowntree's works.

Batti-Wallahs Society.—Arrangements have been made for the members of this society to visit and inspect the R.M.S. "Olympic," at Southampton, on July 29. The party will be subsequently entertained to lunch by the president (Mr. W. Slade Oliver) on board the Royal Motor Club yacht "Enchantress," and will witness a regatta in the afternoon.

COLONIAL AND FOREIGN NOTES.

Australasia.—Thuringowa Shire Council recently decided to assent to the application of Mr. J. N. Perkes (on behalf of the proposed Townsville, Queensland, Electric Supply Co.) for authority to construct and work a tramway 2¼ miles in length. It is also proposed that the company supply energy for lighting in the district adjacent to the route.

The "Australian Mining Journal" says: Mudgee (N.S.W.) Council have accepted an offer by Mr. G. T. Edgar to supply electricity in the district for 15 years. The town has hitherto been lighted by gas.

Electricity has come largely into use in the Broken Hill mines with a material saving of costs in every instance. The latest addition to the power plants is that at the Junction North mine. The total cost of installation was £6,050, and it is effecting a saving at the rate of £7,500 a year. The plant includes a Belliss 350 B.H.P. engine and a General Electric (U.S.A.) 200 kw. generator, switchboard with Terrell regulator and 20 three-phase motors, varying from 2 to 35 H.P. The generator motors and switchboard were supplied by the Australian General Electric Co. The main cable in the main hoisting shaft is of the solid bitumen type and the cable to the mill is by W. T. Henley's Co.

Kurri Kurri (N.S.W.) Council have asked the East Greata Coal Mining Co. to supply electricity for street lighting, and supply will probably be given by overhead cables, permission for the erection of which Cessnock Council will grant under certain conditions.

Temora (N.S.W.) Municipal Council have engaged Mr. J. E. Donoghue, of the Electric Lighting Corpn. (Balmain), to prepare an estimate of the cost of establishing an electricity undertaking.

Messrs. Noyes Bros. have nearly completed the work of erecting and equipping electricity works for Moree (N.S.W.).

Newcastle (N.S.W.) Council recently adopted reports by a special commissioner and by Mr. J. E. Donoghue (of the Electric Light Corpn. Balmain) on the management of the Council's electricity undertaking and the late engineer (Mr. R. Brydon) has resigned in consequence. Mr. Donoghue considered that the engines were in fair condition, the site of the power house was bad, the pipework was in a very bad state of repair, the high-pressure cables were too close to buildings and the low-pressure mains for private supply were not designed to give a reasonably constant pressure at consumer's terminals. He suggested the expenditure of £1,400 for new low-pressure feeders and other alterations of mains and poles, £450 for sub-station equipment, £1,020 for street lamps, £220 for overhauling boilers, &c., £1,800 for condenser and cooling tower, £330 for water softener and water meter, £200 for changing single-phase motors and £259 for meters, &c. Mr. Bryden said £975 more was spent in public lamps in 1910 than in 1909, mainly on reconstruction, and £1,275 was debited against the year's revenue for accident compensation but the accident was not caused by any of the cables erected since he has been in charge of the undertaking. He had not been given credit for the improvements made or the largely increased output, which had more than doubled between March, 1909, and June, 1910, during which period generation costs had been reduced from 2·21d. to 1·20d. per unit. He was appointed when the cables, poles, &c., had reached the end of their useful life. The receipts for the year to December last were £8,206.10s.5d.

Digitized by Google

and the working and general expenses (including £1,330. 5s. 1d. special charges) were £8,883. 4s. 1d., showing a loss of £676. 13s. 8d.

The Harden Gold Mining Co., Harden (N.S.W.) has ordered an electric pumping plant.

The Electric Lighting Corpn., Balmain (N.S.W.), recently decided to invite tenders for a 500 kw. mixed pressure turbine.

The Electrical Trades Union for N.S.W. have decided to ask the Arbitration Board to fix minimum daily wages of 9s. for arc lamp trimmers, 10s. for arc lamp trimmers doing patrol duty and maintenance work and 10s. 6d. for men in charge of small generating plants (under 5 kw.).

Devonport (Tasmania) ratepayers recently approved (by plebiscite) a proposal to borrow £3,200 for extension of the electric lighting system in East Devonport. A 540 ampere-hour battery and a new balancer and booster set are being installed by Messrs. Warburton, Franki & Co. at a cost of £1,200. A sub-aqueous cable will be laid in the river Mersey from Devonport to East Devonport, where the distribution will be by bare overhead conductors, erected by the Council's own employés.

With the reduced charge made by the Mount Lyell M. & R. Co. for the supply of current to Queenstown (Tasmania) municipality the local Council find that the undertaking pays its way, and it is announced that they will continue to supply carbon lamps free to their consumers.

The report of Mr. S. Irwin Crookes, who was commissioned by the public authorities of Whangarei county, North Auckland (N.Z.), to investigate the question of the utilisation of the Wairua Falls for the generation of electric power, states that the falls are 45 ft. in height, and at midsummer give a flow of 285 cubic ft. per second. The best position for a power station is 1½ miles from the falls, and there a fall of 132 ft. can be obtained, providing 3,300 H.P. minimum and 5,000 H.P. during nine months of the year. A few miles above the falls there is a natural layout for a reservoir, by which a continuous horse-power of 7,000 can be obtained. The falls are 18 miles from Whangarei town and also from Dargaville. A three-phase 20,000-volt transmission scheme is recommended, with turbines and generators of 1,500 H.P. to 1,700 H.P. at the outset. Totara poles would be particularly suitable for carrying the transmission line, and these poles, 35ft. in length, can be obtained in the district. The capital cost of the initial scheme would be: For power station £10,000, station equipment £6,000, deflector flume and penstocks £10,000, transmission lines and sub-station £28,400; total £54,400. Taking the cost as £60,000 (including contingencies), the interest at 5 per cent., and 5 per cent. depreciation, would come to £6,000 per annum, and working expenses would be more than covered by £3,000. Assuming that the proposed cement works, 4 miles from Whangarei, were established and took 700 H.P., the total revenue, with 600 H.P. supplied for other purposes, might be estimated at £11,700 (at £9 per horse-power) per annum, so that (says the report) a considerable profit would accrue.

The Public Works Committee for New South Wales recently heard evidence by Mr. Wm. Corin, electrical engineer of the department, on the Wagga and Tumberumba electric railway proposal. Mr. Corin said the construction of a light electric mountain railway was an up-to-date method of economically developing certain of the hitherto untouched resources of the State. He was of opinion that it would not be practicable with a standard gauge line to closely follow the coach road as Mr. A. J. Arnot had suggested on the route by way of Mount Horeh, but an intermediate course might be adopted with advantage. The cost of water-power works on Gilmore Creek would amount to £13,650, and the annual amount required for capital charges with 30 per cent. for repairs and renewals £1,842 for the generating station and (*ex*-traffic costs) £10,044 for the railway. At Buddong Falls greater power could be obtained, but as this was much further from the proposed line, the cost would be greater, and he had not made an estimate. The equipment of 50 miles of line would cost £150,000, if 20-ton locomotives and 45-lb. rails were used.

The telephone lines at Rockhampton (Queensland) are being placed underground, and a new exchange is to be equipped at the Telegraph Office. The cables will vary from 26 pairs to 208 pairs of wires.

In giving evidence before the Royal Commission on Suburban Traffic recently, Mr. Wm. Stone, electrical engineer, of the Victoria Railways Department, expressed the opinion that "from the technical standpoint electric traction in its present state of development is capable of fulfilling the most exacting requirements of passenger and goods traffic, either on suburban or main lines." He stated that, apart from interurban lines in the U.S.A., of which there are 7,783 miles, there are in 10 countries 1,495 miles of d.c. railways, 1,316 of single-phase and 161 of three-phase, a total of 2,882 miles. There are in England 195 miles d.c. and 19 miles single phase.

The Victorian Traffic Commission recently visited Adelaide (S. Australia) and took evidence. The acting mayor (Ald. Bontham) said there was no serious competition between the municipal tramways and the suburban railways. He would not favour State control over Adelaide tramways. The chairman of the Commission (Mr. Mackey) said the Adelaide cars had brightened up everything. The chairman of Walkerville Council and several members of the Municipal Tramways Trust also were opposed to State control.

A petition signed by 337 ratepayers and 85 tenants has been presented to Bundaberg (Queensland) Council asking them to consider the question of establishing electricity supply works.

Messrs. G. B. Lincolne & J. K. McDougall have been engaged as consulting engineers to prepare a report for Lilydale Shire Council on a scheme for electricity supply in Lilydale, Croydon, Ringwood and adjacent districts. It is probable that water power will be used.

A movement is on foot for the formation of a company to supply electricity in Bairnsdale (Victoria).

Townsville (Queensland) Council have decided to assent to the provision of electricity supply and electric tramways by the Townsville Electric Supply Co.

Shire Council have obtained an Order in Council authorising the installation of electric light and power plant for Euroa township.

Austria.—The Austro-Hungarian Government, which is considering the question of adopting electric traction on the State railways, have appointed two experts, one to visit England and the other the United States, in order to report on electric traction in those countries.

Brazil.—Consular reports state that the Government has given a contract to a Brazilian firm for electricity supply works and tramways in the city of Parahyba.

A report from Espirito Santo states that electric tramways are being substituted for the old mule drawn cars, but so far nothing has been done towards the contemplated electrification of the Diamantina Railway.

Canada.—A company is to be formed with a capital of $5,000,000 to erect hydro-electric works on the Khtada and Falls rivers, branches of the Skeena river. The company will also issue about £600,000 in 5 per cent. first mortgage bonds. It is intended to supply about 1,500 H.P. of electric energy from a provisional plant for the immediate demands of Prince Rupert, and to proceed to the construction of a permanent plant capable of supplying 15,000 H.P. on the completion of the Grand Trunk Pacific Railway.

The Imperial Trade Correspondent at Toronto reports that a company has recently been formed, with a capital of $1,000,000, to manufacture and deal in metals, carry on the business of mechanical and electrical engineers, etc., and construct and work gas and electric plants.

Cuba.—The Belgian Legation at Havana states that electric railways are to be built in the province of Santa Clara, and hydro-electric works will be established for supplying power.

The mountain torrents of Trinidad will be diverted into a reservoir having a capacity of 7,000,000,000 gallons. The Habanilla waterfalls, north of Cienfuegos, are to be harnessed to obtain the 30,000 H.P. estimated to be required to work the 300 miles of railway, for which a United States syndicate has secured a concession, between Cienfuegos, Cruces, Manicaragua, Santa Clara, Camiguani, Tunas, Fomenta, Sagua and Caibarien. The concessionaires also intend to supply electric energy to the towns through which the railway will pass, and to a number of sugar refineries.

Customs Duties.—Australian Customs decisions ordain that the following import duties are leviable:—

Electro-medical apparatus (for use with current from dynamos) for galvanisation, electrolysis and faradisation, and globe ear-phones, for use by deaf persons (as electrical appliances, &c.), 17½ per cent. ad val. (British goods 10 per cent.).

Italy.—Signor Jacques Sutter, engineer, has entered into a contract for the construction and working of an electric railway between Domodossola and the Swiss frontier, to connect the Simplon and St. Gothard lines.

Russia.—A consular report on the Moscow district states that during 1910 there was a considerable increase in the employment of electrical energy in Russia.

The Russian factories turned out as many Diesel engines in 1910 as in the whole of the preceding five years, and the output of cables and tramway and telegraph apparatus also increased. The provincial towns of Orel, Tamboff, Kaluga, Smolensk, Minsk, Tula and Moghileff have electricity supply; and other municipal works in progress or in contemplation.

It is stated (in a report from Krasnoyarsk) that in Eastern Siberia electrical goods find a good market.

A German contemporary states that F. A. Lipski and A. W. Below propose to form a company for the construction and working of an electric railway from Moscow to the Ssergievski Possad, with branch lines to the Northern Railway. The lines would be about 46 miles in length, and the cost of construction is estimated at 8,674,900 roubles (about £915,000). The project has been submitted to the Council of Ministers.

Spain.—The monopoly hitherto held by the Cia. Sevillana de Electricidad, a Spanish company with German capital, is likely to be invaded by competition.

The Soc. Catalana de Alumbrado por Gas, hitherto supplying gas only, have decided to also supply electricity. This company has a contract for lighting the town by gas, but by the desire of the Town Council this will be substituted by electricity. The necessary contract will be given to the company as soon as it is in a position to carry out the work. Mr. Bailey, an Englishman, is the local manager.

No progress has been made so far in the projected electric tramways in Cordoba city, though various schemes have been propounded, and the authorities are anxious to see them carried out, more especially a line to the southern slopes of the near Sierra.

Switzerland.—A concession has been granted for constructing an electric railway (partly rack and pinion system) from Meiringen to Engelberg, about 19 miles. The cost is estimated at £352,000.

Messrs. Buckler, Frei & Noef (Peterszell) have obtained a concession for constructing a narrow gauge electric railway from Waldstatt to Brunnadern, 12 miles in length, at a cost of £77,200.

Digitized by Google

Wireless Telegraph Notes.—On July 1 the new law came into force which stipulates that any steamer carrying 50 or more passengers from any port in the United States to any place abroad distant 200 miles from the same port cannot be granted clearance unless provided with a wireless telegraph system in charge of a certificated operator. Penalty for non-compliance is £250.

It will be remembered that a similar ordinance came into effect in Italy on Jan. 1 last.

Uruguay.—A local engineering firm, representing a syndicate of French capitalists, is reported to have been authorised by the Ministry of Public Works to make surveys for an electric railway from Montevideo along the coast to Maldonado and Punta del Este, about 75 miles. Power is to be generated by low grade brown coal or peat obtained near Maldonado. The line is to be double and of gauge 1,676 metres (about 5,5 ft.). Power would be supplied on the overhead system.

ELECTRICITY SUPPLY AND TRAMWAY ACCOUNTS.

Blackpool.—The total income of the electric supply department for the year ended March 31 was £33,972, including £17,760 from the sale of current for private lighting, £8,929 for current supplied to the Tramways Committee, £1,028 from the Blackpool, St. Anne's & Lytham Tramways Co., and £6,051 from public lighting, &c.

The working expenses were £15,978, leaving a gross profit of £17,994. Interest and sinking fund absorbed £12,724 and the net profit was £5,270 (against £6,266), of which £3,000 was devoted to relief of rates and £2,270 carried to reserve and renewal fund. 3,876,843 units were generated (against 3,884,151), 1,343,753 were sold by meter for private lighting and power, 279,872 for public lighting (270 arcs and 781 incandescent and Nernst lamps), 1,466,654 for traction, 54,000 for lighting Lytham-road South, and 438,051 were used on the works. There are 1,532 consumers, an increase of 102.

Glasgow.—The accounts of the tramways department were adopted by the Corporation on Monday.

The traffic revenue was £946,021, and rents, &c., brought the total income to £949,489, against £896,720. The working expenses (£533,179) included £270,792 for traffic expenses (against £265,395), £105,046 (£102,389) general expenses, £119,582 (£99,153) repairs and maintenance, and £37,759 (£35,974) for power, leaving £416,310 to meet rental of leased lines, &c. (£4,966), interest (£75,168), sinking fund (£89,794), income tax (£13,492), &c., and after appropriating £202,579 for depreciation and permanent way renewals fund the net balance (£68,678, against £53,028) was carried to the common good. The gross capital expenditure was £3,503,174, an increase of £78,446 over 1910, but the net expenditure is £1,800,259. There are 196¼ single miles of line open for traffic (against 190½); 237,967,307 passengers were carried (against 222,730,571), and 21,704,237 car-miles run (against 20,974,016). Total number of units used for traction and car lighting was 28,345,441 (26,860,126), or 1·31 per car-mile; traffic revenue per car-mile was 10·461d. (10·225d.), the average fare paid per passenger 0·954d. (0·963d.), and the precentage of expenses to total receipts 53·7 (53·82).

In moving the adoption of the accounts Bailie RUSSELL said that, favoured by good weather and somewhat improved trade during the past year, and with the exhibition in swing during the last month of the financial year, the result of their operations during the past 12 months exhibited a somewhat improved position. After giving an analysis of the accounts, he said that, as regarded the future, while they were making a good beginning, having £6,554 increase in one month, they had a considerable number of responsibilities facing them which should for a long time to come prevent any tampering with the financial position in the direction of reduced fares. They had a bridge at Dixon-street, a line of tramways up Portland-street, two bridges at Clydebank and several extensions that might require to be made in the course of the year. The cost of equipping the remaining cars with vestibules for the protection of motormen in inclement weather would cost £25,000, and they had still £8,000 or £9,000 to spend in equipping the remaining cars with top covers. The controllers were being brought up to date at a cost of a few thousand pounds. Brakes, now obsolete, were being replaced at an expenditure of about £25,000. The 100 old horse cars that they had still running would require to be discarded soon, and that meant in replacement an expenditure of something like £40,000. In addition, they had to face an extra expenditure this year, compared with last, of £9,000, representing the cost of the recent increase of wages, and on that point he was glad to say that the lowest paid able-bodied men in the employment (cleaners, sandmen and greasers) began with 23s. per week, advancing to 28s. per week in the course of three years. They might look for a further increase in the cost of the upkeep of the permanent way. All those things warranted them in maintaining a careful financial policy to enable them to go along on safe financial lines and be able to face anything unforeseen in the future. The thanks of the Corporation were due to the general manager and his entire staff for the continued ability displayed in the management of the department during the year.

Hornsey.—The accounts of the electricity department for the year ended March 31 show gross capital expenditure £154,344 (increase £3,869), of which £29,917 has been repaid.

Revenue was £19,752, working and general expenses were £7,636, and after providing £50 for bad debts and £674 for purchase of meters, £4,880 for instalment of loans and £4,691 for interest, there was a surplus of £3,103 to carry forward. Units generated were 1,657,846, supplied to public lamps 79,706, and to private consumers 1,044,774. The total maximum demand was 925 kw. There are 58 arc and 138 incandescent lamps for public lighting.

King's Lynn.—There was a net profit of £1,034 for the past year on the electricity undertaking against £838 in 1910.

The receipts from the sale of current were £6,312, against £6,177. In view of last year's profit a reduction of £223 was made in the charge for street lighting for the past year. The original capital was £50,766, and £20,495 has been repaid, leaving £30,271 outstanding. After the expenses for 1910-11 had been met the gross profit was £4,089, equal to 8 per cent. on the capital. After Oct. 1 next the price of current will be 4d. per unit. Out of this year's profit £280 of capital expended in excess of sanction has been met, and £300 handed over for relief of rates.

Sunderland.—The income of the tramways department for year ended March 31 was £59,071, including £58,889 traffic revenue.

The expenses were £37,189, leaving a gross profit of £21,882. Interest required £7,686 and income-tax £347, and after making provision for loan repayment (£10,355), placing £1,423 to reserve and renewals fund, and making sundry payments, the balance (£2,000) was carried to the borough fund. The gross capital expenditure is £393,546. 14,561,672 passengers were carried, and 1,451,905 car miles run; 1,702,872 units of energy were used (1·17 per car mile) and the average traffic revenue per car mile was 9·7d.

TRADE NOTES AND NOTICES.

TENDERS INVITED.

Tenders are invited for supplying plant and materials and the erection of electric supply station buildings for lighting the DUNDALK Urban District area, under its Electric Lighting Order, 1897. The plant includes generating station buildings, gas producing and generating plant, balancer and booster, switchboard, storage battery, mains (overhead and underground) electricity meters and travelling cranes. Copies of specifications, general conditions, &c., may be seen at the offices of the clerk, Mr. Mathew Comerford, Town Hall, Dundalk, or at the offices of the consulting engineers, Messrs. T. L. Miller, Wilson & Pegg, Donegall-square, Belfast, 709, Tower-buildings, Liverpool, or 19, Brazenose-street, Manchester. Tenders to the town clerk, Dundalk, by 10 a.m. of July 24. See also an advertisement.

The Urban District Council of ESHER and the DITTONS invite tenders for the installation of a system of wireless alarms in Thames Ditton and Long Ditton wards of the district. A plan of the district may be seen at the Surveyor's offices, where particulars may be obtained. Tenders to the clerk of the Council, Mr. E. A. Everett, Council Offices, Thames Ditton, by July 24. See advertisement.

ALDERSHOT Urban District Council invite tenders for supply and erection at their electricity works of one 135 kw. Diesel direct-coupled set. Specifications and further particulars from the engineer, Mr. F. Garside, Electricity Works, Laburnum-road, Aldershot. Tenders to the Clerk to the Council, Mr. W. E. Foster, by *noon* July 17. See also an advertisement.

Tenders are also invited up to Aug. 2 for the supply of telegraph and telephone material to the Postmaster-General's Department in WESTERN AUSTRALIA, and up to Aug. 23 for the supply of telegraph and telephone material to the Postmaster-General's Department in SOUTH AUSTRALIA. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W. See also advertisements.

Tenders are invited up to July 31 for the supply of telegraph and telephone material to the Postmaster-General's Department in TASMANIA; up to Aug. 8 for the supply of measuring instruments, telephone instruments and parts, trembling bells and gong and 8 in. gong to the Postmaster-General's Department in VICTORIA; and up to Aug. 16 for cable, conduits, c.i. pipes, iron poles, insulators, wires, &c., for the Postmaster-General's Department in QUEENSLAND. Specifications from the Commonwealth Offices, 72, Victoria-street, London, S.W. See advertisements.

Tenders are invited (up to Aug. 15) for the supply of (*a*) 80,000 insulators and (*b*) indiarubber covered wire to the Postmaster-General's Department in VICTORIA, and (up to Aug. 23) for the supply of letter box fronts to the Postmaster-General's Department in QUEENSLAND. Tender forms and specifications from the Commonwealth Office, 72, Victoria-street, London, S.W. See also advertisements.

Tenders are invited up to Aug. 9 for the supply of letter-box fronts to the Postmaster-General's Department in NEW SOUTH WALES. Tender forms and specifications from the Commonwealth Offices, 72, Victoria-street, London, S.W. See advertisement.

Tenders are invited up to Aug. 9 for supply of four motor cars (petrol) complete and for the supply of letter box fronts to the

Digitized by Google

Postmaster-General's Department in SOUTH AUSTRALIA. Tender forms and specifications from the Australian Commonwealth Offices, 72, Victoria-street, London, S.W. See an advertisement.

LONDON COUNTY COUNCIL require tenders by 11 a.m. for an electrical installation at Hamond-square elementary school, Hoxton. Specifications, &c., from the Chief Engineer, Spring-gardens, S.W.

The Council of the Metropolitan Borough of POPLAR invite tenders for the supply, delivery and erection at their Glaucus-street electricity works of overhead coal bunker, coal conveyor and extension and modification to existing coal conveyor. Specification and form of tender from the borough electrical engineer (Mr. J. Horace Bowden). Tenders to the Town Clerk (Mr. Leonard Potts), Council Offices, High-street, Poplar, London, E., by 10 a.m., July 15.

STOKE NEWINGTON (London) Public Library's Committee invite tenders for the installation of wires and fittings for electric lighting and ventilating at the Public Library, Church-street, Stoke Newington. Copies of specification and forms of tender from the librarian and clerk (Mr. George Preece), Public Library, Stoke Newington, N., where tenders are to be delivered by July 10.

WALTHAMSTOW Council require tenders by noon July 21 for feeder cables and stoneware conduits. Specifications, &c., from Mr. G. R. Spurr, Electricity works, Walthamstow.

CALCUTTA ELECTRIC SUPPLY CORPN. (LTD.) are prepared to receive tenders for the supply, delivery and erection at the site of their Cossipore station, Calcutta, of auxiliary plant, and pipework. Copies of specification, drawings, &c., from the Secretary of the company, Mr. Francis R. Reeves, Salisbury House, London Wall, London, E.C., to whom tenders by 10 a.m., July 24.

The Tramways and Electricity Committee of BELFAST Corporation invite tenders for the supply of a circulating water pump and a motor-driven air pump. Specifications and form of contract from the city electrical engineer, Mr. T. W. Bloxam. Tenders to the town clerk, Mr. R. Meyer, by 10 a.m. Monday, July 17.

ECCLES Corporation invite tenders for supply and erection of a high-efficiency type centrifugal pump, driven direct by s.ph. a.c. motor (approx. output 63,000 gallons per hour against 35 ft.). Tenders to Town Clerk by July 17.

SWINFORD (co. Mayo) Electric Lighting Committee invite tenders for the electric lighting of the town. Specifications from the Clerk to Swinford Rural Council, to whom tenders by 11 a.m. July 10. The requirements include suction gas plant, engines and dynamos, storage battery, switchboard, overhead lines and street lamps.

CARDIFF Corporation require tenders by 10 a.m. July 14 for the supply of economisers and induced draught installation and supply and laying of cables. Forms of tender from Mr. A. Ellis, The Hayes, Cardiff.

REDDITCH Council invite tenders for supply of single-phase alternator direct coupled to Willans steam turbine, condensing plant and pipe work. Tenders to the Clerk by 5 p.m. July 10.

COWDENBEATH Council require tenders by noon, July 10, for the manufacture and erection of a Diesel oil engine and a c.c. generator. Specifications from the Burgh Surveyor.

SALFORD Corporation require tenders (by noon July 17) for supply of a water-tube boiler, with superheater. Particulars from Borough Electrical Engineer.

HAMMERSMITH (London) Council require tenders by 4 p.m. July 12 for the ensuing year's supply of Welsh steam coal for the electricity works.

Tenders are invited (up to July 18) for the supply of 4 tons 6 cwt. hire hard-drawn copper cables, and (up to July 2) for the supply of 35,700 incandescent electric lamps to the City of MELBOURNE, Australia. Copies of specification, tender forms, &c., from the agents for the City Council (McIlwraith, McEacharn & Co. Ppty., Ltd.), Billiter-square-buildings, London, E.C.

The Deputy Postmaster-General, HOBART, will receive tenders until noon July 31 for supply of telegraph and telephone material. Specifications, &c., from 72, Victoria-street, London, S.W.

The Deputy Postmaster-General, BRISBANE, will receive tenders until noon Aug. 16 for supply of paper-insulated lead-covered cable, and silk and cotton insulated lead-covered telephone switchboard cable, covered wire, g.i. and steel standard wire, c.i. pipes, iron and steel poles, insulators and copper wire, and accessories. Specifications, &c., from 72, Victoria-street, London, S.W.

Tenders are invited up to July 25 for the supply of 12 sections of a branching multiple magneto lamp signalling switchboard, &c., or one automatic or semi-automatic switchboard, &c., to the Postmaster-General's Department, VICTORIA. Tender forms, &c., from 72, Victoria-street, London, S.W.

The time for the receipt of tenders by the Ministry of Public Works, Constantinople, for an electric power and tramway concession for JERUSALEM, is extended to Sept. 13. Specifications (in French) may be seen at 73, Basinghall-street, London, E.C.

The Metropolitan Water and Sewerage Board, Albert-street, BRISBANE, Queensland, want tenders by noon Jan. 30 next for supply and erection, of one, two or three complete units, each consisting of power generating plant and pump or pumps to lift not less than 6,000,000 gallons per day. Particulars from the Secretary.

The Deputy Postmaster-General for NEW SOUTH WALES will receive tenders until 2:30 p.m., Aug. 23, for supply of telegraph, telephone and electric lighting material. Specification from the Commonwealth Offices, 72, Victoria-street, London, S.W.

MORTLAKE (Victoria) Butter & Cheese Factory Co. require tenders by noon Aug. 14 for supply of dynamo and booster, storage batteries and accessories, switchboard, cables, &c. Specifications from Messrs. F. A. McCarty & Co., 31, Queen-street, Melbourne.

WELLINGTON (N.Z.) Corporation require tenders by 4 p.m. Aug. 24 for supply of a motor power waggon and accessories for the electric tramways department. Gonville and Castlecliff Tramway Board, Ridgway-street, WANGANUI (N.Z.) require tenders by 4 p.m. Aug. 14 for supply of overhead tramway material, feeders, &c. Conditions, &c., can be seen at 73, Basinghall-street, London, E.C. Representation in New Zealand is necessary.

Tenders will be received at the Stadtbaudeputation Offices, Breslau (Germany), on July 25 for supply of centrifugal pumps and electric motors.

STAVROPAL (Caucasus) Municipal Council invite tenders until Aug. 14 (O.S. Aug. 1) for the construction and working of an electric tramway.

Tenders will be received until July 24 by the Civil Governor, Lerida (Spain) for the establishment and working of a telephone system in CERVERA.

Tenders will be received until July 26 by the Civil Governor, Santander, for the establishment and working of a telephone system in TORRELAVEGA (Spain).

Tenders will be received until July 21, for the supply of electrical energy for light and power to the Arms Factory, OVIEDO (Spain) for six years.

TENDERS RECEIVED AND ACCEPTED.

London County Council have received the following tenders for overhead equipment for the Brixton-Herne Hill tramway :—

Dick, Kerr & Co. (accepted)	£2,093 10 9
Clough, Smith & Co.	2,148 2 9
British Insulated & Helsby Cables	2,151 18 10
R. W. Blackwell & Co.	2,462 11 8

Chief officer's estimate £2,800. Permission has been given to sublet to Bradshaw & Sons, pole bases; British Mannesmann Tube Co., overhead poles; F. Smith & Co., trolley wire; Bartons, pole straps and scroll work; British Insulated & Helsby Cables, overhead fittings; and Leys Malleable Castings Co., span wire crosses.

London County Council received six tenders for compressed air cleaning apparatus for motors at car sheds, varying from £1,505 to £1,934, and three tenders, from £665 (incomplete tender) to £1,790. 9s. for lifting plant for unloading trucks, motors, &c., at car sheds.

Chief officer's estimate for both contracts £2,970. The Highways Committee recommend the acceptance of the tenders of the Globe Pneumatic Engineering Co. (£1,505) for the former and S. H. Heywood & Co. (£1,790. 9s.) for the latter contract, and that permission be given in the case of the cleaning apparatus contract to sublet the motors to Crompton & Co. and the compressors and receivers to F. W. Brackett & Co., and in the lifting plant contract to sublet to Dorman, Long & Co., D. Colville & Co., or Parkgate Iron & Steel Co., rolled steel sections; Parker Foundry Co., steel castings; H. Hollindrake & Son, iron castings; Abbott & Co., air receivers; Electric and Ordnance Accessories Co., motors and controllers; W. T. Glover & Co., cables; and Richd. Johnson & Nephew, overhead line work.

London County Council have also accepted the tenders of the British Westinghouse Electric & Mfg. Co. for checking meters at Greenwich generating station, £113. 7s., and the Electric Construction Co. for spare motor for coaling cranes at Greenwich generating station, £165.

Wigan Council have accepted the following tenders for annual stores for the electricity and tramways departments :—

General Electric Co., Eckstein, Heap & Co., Parmiter, Hope & Sugden, and British Thomson-Houston Co., electrical accessories; W. T. Henley's Telegraph Works Co., house service boxes; Morgan Crucible Co. and H. G. Meyer & Co., carbons; T. Tyldesley, gauge glasses; British Insulated & Helsby Cables and Watlington & Co., overhead material; Thos. Andrew & Co., iron; Wm. Parke & Co., steel; R. Bolton & Son, brass and metal castings; Douglas Forge Co., iron castings; Taylor & Jones, brake blocks; Fleming, Birkby & Goodall, tramcar accessories (steel spindles and graphite brushes); Percy Clark

Digitized by Google

& Co., tyres; Wallwork & Co., tramcar resistances; Lion Spring Co., springs; P. R. Jackson & Co., British Westinghouse Co., and Dick, Kerr & Co., armature coils; British Thomson-Houston Co., gear cases; British Hele Shaw Clutch Co., gear wheels; L. Andrew & Co., sundries.

Worthing Council have accepted the tender of Mirrlees, Bickerton & Day for the supply and erection of oil-driven generating plant for the electricity works at £3,965. The electric generators are to be supplied by Bruce Peebles & Co., and the contract is subject to the sanction of the L.G. Board to a loan.

Nuneaton Council have accepted the tender of Galloways (Ltd.) for engine and pumps, at £1,723; that of Heenan & Froude for refuse destructor, at £775; and that of J. Thompson for Lancashire boiler, at £310.

The Midland Railway Carriage & Wagon Co. have accepted the tender of Belliss & Morcom for the equipment of the power station at their new works, Washwood Heath, Birmingham, to the specifications of Messrs. D. & A. Home-Morton, consulting engineers.

Gloucester Council have placed an order with Siemens Bros. & Co. for feeder and distributor cable at £1,211. 10s., and with the British Insulated & Helsby Cables for feeder and distributor cable, at £817, and for distribution pillars, at £200.

Norwich Corporation have placed orders with Venner & Co. for 334 time switches, making the number of time switches in use in that town considerably more than 400.

Margate Council have accepted the tender of Kingston & Co for wiring Cliftonville Pavilion, and that of Siemens Bros. Dynamo Works for lamp fittings, to replace arc lamps, at £6. 15s. each.

York Electricity Committee have accepted the tender of the Tudor Accumulator Co. for the maintenance of the storage battery at the electricity works, at £140 per annum.

The tender of Krupka & Jacoby has been accepted by Heston and Isleworth Council (at £80) for annual supply of metal filament lamps for street lighting.

Leyton Council have accepted the tender of the Union Cable Co. (at £164) for supply of turbo-generator connecting cables.

Dudley Council have placed an order with Bellis & Morcom for a high-speed steam engine at £675.

Haslingden Council have accepted the tender of Siemens Bros. & Co. for cables.

Eaglehawk (Victoria) Council have accepted the following tenders in connection with their electricity scheme:—

R. Hornsby & Son, suction gas engine, £1,118; Australian Metal Co., dynamo and booster, £260; Pfaff, Pinschof & Co., switchboard and apparatus, £128; Haes & Eggers, E.P.S. storage battery, £530. Consideration of the cable and wire tenders has been deferred.

The Governor-General of Victoria recently approved the purchase of 4,720 ft. c.i. piping from Stewarts & Lloyds, £293. 15s.

The Governor-General of Western Australia has approved the purchase of 1,000 four-way conduits (for the Postmaster-General's Department) from Mills & Co., £212. 10s.

The Bombay Electric Supply and Tramways Co. have placed an order with the Bastian Meter Co. for 300 three-ampere meters.

BUSINESS NOTICES.

The Electric & Ordnance Accessories Co. notify that in future they will be represented for their electric manufactures in and round Sheffield (for a radius of 10 miles) by Mr. H. E. Ridley, 104, Marlcliffe-road, Sheffield. The agency for "Vickers" centrifugal fans will remain, as before, in the hands of Mr. J. Crowford, 2, Exchange-street, Manchester.

Messrs. Gent & Co. have removed their London office to 25, Victoria-street, Westminster, S.W. Telegrams: Knifedge London; telephone: 548 Westminster.

Plant for Sale.—Mr. A. Underwood, 3, Queen-street, London, E.C., has for sale a 58 H.P. motor generator (440 volts to 110/125) and a switchboard.

Patents Development.—The owner of patent No. 16,183/1908, for "Improvements in or relating to telephony and telegraphy," desires to negotiate for the granting of licences thereunder. Particulars from Messrs. Lloyd Wise & Co., chartered patent agents and consulting engineers, 46, Lincoln's Inn Fields, London, W.C.

The proprietors of patent No. 23,878 of 1900 for "Improvements in process of and mechanism for separation of conductors from non-conductors" desire to enter into arrangements for exploiting same in this country. Applications to Messrs. Haseltine, Lake & Co., patent agents and consulting engineers, 7 and 8, Southampton-buildings, Chancery-lane, London, W.C.

The proprietor of patent No. 13,163/1905 for "Improvements in dynamo electric machines," desires to dispose of the patent rights or to negotiate for the granting of licences. Particulars from Messrs. G. F. Redfern & Co., patent agents, 15, South-street, Finsbury, London, E.C.

The proprietor of patent No. 27,552/1907, for "Improvements relating to means of transport by land, water or air, such as vehicles, ships or the like," desires to negotiate for exploiting same in the United Kingdom. Communications to Messrs. R. Bellield (Ltd.), consulting engineers, 3, London-wall-buildings, London, E.C.

I.R.G.P. Co.'s Exhibit at Glasgow.—We publish herewith a photograph of the exhibit of the India Rubber, Gutta Percha & Telegraph Works Co. at the Scottish Exhibition of National History, Art and Industry, now being held at Glasgow.

The goods exhibited include: An assortment of hose, packing, valves, washers, buffers, belting, carriage tyres, mats, cables, "Silvertown" fountain pens, heel pads and shoe soles, cells, ebonite goods of various kinds, testing and telegraph instruments, and gutta percha goods, repre-

senting a portion of the company's manufactures. It will be noticed that the company's golf ball, the "Silver King," won the amateur championship and the "Cruden Bay" professional tournament. Last week the open championship was won by Harry Vardon, playing with this excellent ball, and to this list of successes must be added the Scottish professional and Midland championships, and the Tooting Bec and Bramshot cups. The floor of the stand is covered with india rubber tiling, of which the compnay were the pioneers some 22 years ago. This material has been successfully laid on nearly 200 vessels and in over 60 banks, insurance offices and public buildings, and recently in Buckingham Palace and Marlborough House.

The Holiday Season.—All who have—or think they have—earned a holiday are turning their attention to the question of where to go, and how to get there. Most of the railway companies offer assistance in this respect and the Great Central Railway, whose service taps so many of the health, rest, pleasure and leisure resorts, have ready a programme of tourist and excursion facilities for week-ends and for longer periods which can be obtained from the chief station at Marylebone, the company's town office, and by post on request from the Publicity Department, 216, Marylebone-road, N.W. Many of the tours and holiday schemes include the health resorts on the North-Eastern Railway, and some of these are of special interest to those who may wish to include some of the more northern or north-eastern centres of health and recreation. Within the range of the G.C. Company's service is the beautiful Shakespeare country, the Chiltern Hills, and some charming country in the counties nearer London.

BANKRUPTCIES, LIQUIDATIONS, &c.

A receiving order has been made against Cuthbert Fenton Lindop electrician, lately trading at 62, Dale-street, Liverpool.

Thos. Chas. Francis, electrical engineer, 66, Liverpool-road, Stoke-on-Trent, has been adjudicated bankrupt. The first meeting of creditors will take place on July 12 at the O.R.'s, King-street, Newcastle, Staffs., and the public examination on July 18 at the Town Hall, Stoke-on-Trent.

A receiving order was recently made against the estate of the late E. Ristori, civil engineer, Parliament-street, S.W., and a meeting of creditors was held on Friday. It was reported that the liabilities would amount to about £100,000; assets were uncertain, consisting mainly of a claim against the Aluminium Corpn. (Ltd.)

A meeting to receive an account of the winding up of Mountain & Gibson (Ltd.) will be held on Aug. 1 at the offices of Thos. Bowden Son & Nephew, Parr's Bank-buildings, York-street, Manchester.

PATENT RECORD.

APPLICATIONS FOR PATENTS.

*Note.—The undermentioned Applications (except those marked †) are not open to public inspection until after acceptance of Complete Specifications. Those marked * are open for inspection 12 months after the date attached to them, if they have not been published previously in the ordinary course. Names within parentheses are those of communicators of inventions. When complete Specification accompanies application, an asterisk is affixed.*

May 8, 1911.

11,045 HIRST & BROOK. Electric motor controllers.
11,047 YERKE. Periodicity indicator and recorder.
11,097 SALOM. Positive plates for storage batteries.
11,132 LODGE & MUIRHEAD. Preventing interference in wireless telegraphy.
11,133 CROMPTON & BRITISH L. M. ERICSSON MFG. CO. Telephone transmitters, receivers or like devices.
11,140 B.T.-H. Co. (G.E. Co., U.S.) Vapour electric devices.

May 9, 1911.

11,162 GRATZSCHMIDT. Frequency transformer. (Convention date, 9.5.10, Germany.)*
11,195 JONES-MILLER. Electrically indicating or recording the position, time and speed of trains on railways.
11,209 ISENTHAL. Method of and means for varying electrical capacity and/or induction.
11,234 LAKE. (Bronislaw, Gwozdz, Germany.) Thermo-telephones.
11,237 STERLING TELEPHONE & ELECTRIC CO. & BELL. Intercommunication telephone systems. (Addition to 1,631/10.)
11,239 MEHNE. Electric time switches. (Addition to 14,052/09.)*
11,242 B.T.-H. Co. & BINGLEY. Electric heating devices.

May 10, 1911.

11,279 WILLIAMS & MCCALLUM. Indicating earth leakage in electric circuits.
11,285 PEREZ. Arc lamps.*
11,313 BRITISH ELECTRIC TRANSFORMER CO. & MCWILLIAM. Electromagnetically operated switch and like arrangements.
11,311 BRITISH ELECTRIC TRANSFORMER CO. & BERRY. Distribution of alternating currents.
11,322 CASAGRANDE. Device for reducing expenditure in electricity.*
11,326 SCHNIEWINDT. Electrical resistances. (Convention date, 18.5.10, Germany.)*
11,339 BERTINI. Transmitters and receivers for wireless telegraphic and telephonic apparatus.*
11,349 B.T.-H. Co. (G.E. Co., U.S.) Electromagnetically-operated devices.
11,350 B.T.-H. Co. (G.E. Co., U.S.) Controlling means for electric circuits.
11,351 B.T.-H. Co. (G.E. Co., U.S.) Systems of electric motor control.

May 11, 1911.

11,407 WITHAY. Wireless telegraph transmitting stations.
11,418 WATKINSON & PAYNE. Shade-holders for incandescent electric lights and the like.
11,432 JAMES. (Ges. für Verwertung technischer Patente m.b.H., Germany.) Combustion tricks for arc light electrodes.*
11,454 AURILIA, ATTIMO & CASORIA. Automatic electromagnetic railway signalling devices.*

May 12, 1911.

11,497 WOLTERECK. Process of forming Planté plates.
11,543 ROYSTON. (Electro-Chemical Rubber & Mfg. Co., U.S.) Method of attaching rubber to metals.*
11,548 SCHNEIDER. Electric heat regulator. (Convention date, 9.6.10, Germany.)*
11,551 KUCK. Insulating sockets.*

May 13, 1911.

11,587 HALLWOOD. Electric hand-lamps. (Addition to 436/11.)
11,602 HARTLEY. Electric lighting for vehicles.
11,615 SANDERSON & TRUMAN. Electromagnets.
11,617 SLAUGHTER. Electric welding.
11,641 NUSSBAUM. Microphones.
11,650 SPITTA. Treating finely sub-divided substances by electric osmose.*
11,659 W. T. HENLEY'S TELEGRAPH WORKS CO. & PFIFFNER. Sheathing for electrical conductors.

May 15, 1911.

11,678 GILLAND. Electrical appliance for boiling water.
11,694 WALTON. Electrical switching apparatus.
11,711 W. R. SYKES INTERLOCKING SIGNAL CO. & SYKES. Electrically-insulated fish-joints for railway rails.
11,735 CELLIER. Continuous-speed cones for dynamos with invariable speed of rotation. (Convention date, 14.5.10, Belgium.)*
11,746 SHEEHY. Electromagnetic switch.*

May 16, 1911.

11,795 TAYLOR. Changing the frequency of alternating currents.
11,814 RYAN. Machine for making electrically welded chains, rings and the like.*
11,826 BINGLEY. Electric heating apparatus.
11,911 HARVEY. Spark plug.*

May 17, 1911.

11,976 BEARDMAN, BOARDMAN & BEARDMAN. Arc lamps of the open arc type.
11,981 GABRIELLA. Electrical connections.
11,996 BERTINI. Process and apparatus for magnetically separating materials. (Convention date, 17.5.10, Germany.)*
12,044 MARCONI'S WIRELESS TELEGRAPH CO. & ROUND. Variable inductances.
12,045 CHEMISCHE FABRIK GRIESHEIM ELEKTRON. Depolarisers for galvanic cells or batteries. (Convention date, 10.10.10, Germany.)*
12,060 MARX. (Communicated by Siemens & Co., Germany.) Electric radiation furnaces.*
12,081 SIEMENS. Means applicable for use in locking electric incandescing lamps in their holders.

May 18, 1911.

12,107 RAYLEIGH. Shield or protector for telephone receivers.
12,144 CLIVEY. Coal miner's electric safety lamp.
12,154 EDISON & SWAN UNITED ELECTRIC LIGHT CO. & SWAN. Preparing tungsten and the like for filaments.
12,164 MARCONI. Mounting receiving and transmitting apparatus in radio-telegraphic stations. (Convention date, 28.5.10, France.)*
12,173 PATERSON & LEE. Electric incandescent lamps.
12,174 SMITH. Magneto-electric machine.*
12,178 FOX. Manufacture of electric accumulator electrodes and means for use therein.
12,181 BOWLES. Manufacture of electrodes for electric arc lamps. (Addition to 6,760/02.)*
12,182 MARX. (Siemens-Schuckertwerke G.m.b.H., Germany.) Measuring mechanical forces or weights.*
12,183 GRAHAM. Osborne, Cox, Gattie & New Transport Co. Means for distributing cinders and the like.
12,184 CHEMISCHE FABRIK GRIESHEIM-ELEKTRON. Regeneration of the hitherto waste products of galvanic cells or batteries. (Convention date, 3.6.10, Germany.)*

SPECIFICATIONS PUBLISHED.

1910 SPECIFICATIONS.

[illegible] PERRIS. Controlling of aerial vessels by wave-transmitted electricity.
[illegible] (International Telechronometer Co.) Telephone apparatus.
[illegible] ALLAN MFG. CO. (Cutler Hammer M'f'g. Co.) Starting devices for electric motors, especially adapted for use with multiphase motors.
[illegible] ALLAN MFG. CO. (Cutler Hammer M'f'g. Co.) Electric motor plant having means for equalising the load on the source of electric energy.
[illegible] Safety device for locking incandescent electric lamps in their holders.
[illegible] Combined electric lights and apparatus therefor.
[illegible] HEYBERGER. Varying the voltage in alternating electric current circuits.
12,026 ADAMS MFG. CO. (Cutler Hammer Mfg. Co.) Control of electric motors.
12,322 NEWITT & FLETCHER. Electrical heating appliances.
12,427 BERRY. Switch apparatus suitable for use in electrical distribution systems.
12,521 JONES. Entrance devices for tramway vehicles and the like. (24/5/09, addition to 3,717/10.)
12,614 AMERICAN AUTOMATIC TELEPHONE CO. & GOODRUM. Automatic telephone systems.
12,757 B.T.-H. Co. (G.E. Co., U.S.) Alloys useful as electric resistance conductors.
13,518 B.T.-H. Co. (G.E. Co., U.S.) Arc-light electrodes.
13,962 ELECTRIC CONSTRUCTION CO. & PENSABENE. Controlling induction motors.
14,024 ALLGEMEINE ELEKTRICITATS-GES. Alternating-current dynamo-electric machines of commutator type. (19/6/09, patent of addition not granted.)
14,092 SIEMENS BROS. DYNAMO WORKS. (Siemens Schuckertwerke Ges.) Electric condensers and the like.
14,505 STEWART & WESTMINSTER TOOL & ELECTRIC CO. Electric drills.
15,792 BOWYER & ANCHOR CABLE CO. Process for providing electric conductors with an identifying covering.
16,620 CLARK. (Telelectric Co.) Electrically-operated playing apparatus for musical instruments and music sheets therefor.
17,312 CHADBURN'S (SHIP) TELEGRAPH CO. & GRANT. Speed indicators.
17,819 GOLDSTONE & LIGHTFOOT. Electrical cord grips.
18,867 B.T.-H. Co. (A.E.G.) Devices for securing wires or conductors in place.
19,019 LEONARD. Rheostats, electric heaters or like devices.
19,772 RUTHENBURG. Electrolytic production of antimony.
19,804 REID. Electric furnaces.
20,289 BYNG & ARCHER. Electric heaters.
21,935 BOWYER & ANCHOR CABLE CO. Apparatus for winding material in strips on a wire or the like.
22,103 SHIPLEY. Appliances for fixing and removing electric incandescence lamps.
22,304 DARBY. Electric lamp socket.
23,748 BAEHR. Telephone receivers.
24,686 BOSCH. Interrupter for ignition machines. (22/6/10.)
25,014 BECK. Telemeters.

COMPANIES' MEETINGS AND REPORTS.

BULUWAYO WATER WORKS & ELECTRIC LIGHT CO. (LTD.)—The directors' annual report states that the proceeds of sales of water and electric light amounted to £16,861, compared with £18,432 in the previous year, the decrease being entirely due to the general use of metal filament lamps by private consumers, and their substitution for carbon lamps in the streets. Considerable economies in the management had been effected, and during the current year a marked increase in revenue was already shown.

CHILI TELEPHONE CO. (LTD.)—The report for the year ended March 31 states that the aggregate number of subscribers at all centres was 9,919, a gain of 1,101 for the year. The gross revenue in Chili from all sources was $2,041,198, against $1,851,689 in 1909/10, an increase of $189,509. The expenditure in Chili was $976,570, against $926,387, increase $50,183. The net income in Chili was $1,064,627, compared with $925,301, increase $139,326. Converted into sterling (at the average rate of exchange for the year) the figures were £48,357 for 1910/11, against £40,411, increase £7,946. The balance to credit revenue, including £2,987 from previous year, is £49,131, of which £22,805 has been carried to reserve. An interim dividend of 3s. per share (tax free) was paid on Jan. 15 last, and the directors now recommend a final dividend of 4s. per share (tax free), leaving £3,225 to be carried forward. The £110,000 new share capital, which was authorised at the extraordinary meeting in November, was duly issued, increasing the issued capital to £330,000.

EDMUNDSONS' ELECTRICITY CORPN. (LTD.)—For the year ended March 31 the net profit, after payment of interest, amounted to £16,138, compared with £10,768. 9s. 6d. last year. Adding £25,577. 17s. 5d. brought forward, there remains £41,715. 17s. 5d., which the directors recommend should be carried to reserve. The gross trading profit has increased by £2,335. 1s. 10d. The dividends and interest received have increased by £4,067. 16s. 2d., and the Urban Company's guarantee is less by £854. 2s. 10d., whilst the loss on working the local authorities' undertakings is increased by £1,871. 10s. 6d., the greater part of which is due to payments for interest and sinking fund on sums paid to the company in respect of work carried out during previous years. The total connections of the 21 subsidiary companies are equivalent to 1,441,883 33-watt lamps, against 1,334,584 33-watt lamps in 1910.

GENERAL ELECTRIC CO. (LTD.)—For the year ended March 31 the net trading profits and income from investments, &c., amount to £119,145. 19s. 2d., making, with £8,918. 15s. 4d. brought forward an available total of £128,064. 14s. 6d. After deducting debenture interest and depreciation (£32,330. 15s. 9d.), the balance was £95,733. 18s. 9d., out of which preference dividend has absorbed £12,500 and £43,615. 13s. 2d. has been transferred to reserve, leaving £39,618. 5s. 7d., which the directors recommend should be appropriated as follows:—Managing directors' and employees' bonus £7,431. 10s. 4d., 5 per cent. dividend on the ordinary shares £19,973, leaving to be carried forward £12,213. 15s. 3d. The total reserve account is now £202,103. 14s., and the directors have decided to apply towards writing down goodwill and patents £92,103. 14s., leaving the reserve at £110,000. The directors record with deep regret the death during the year of their late chairman and managing director, Mr. G. Byng. The result of the trading for the year has been satisfactory. The factories at Witton, Salford, Birmingham and London have been well employed during the year. The removal of all manufacturing departments other than telephone and telegraph apparatus from Salford to Witton has been completed, the central stores from Manchester have also been removed to Witton. The additional capital expenditure incurred during the year has been principally devoted to housing these departments. The investment account comprises mainly investments in undertakings owned or controlled by the company, and is developing to the satisfaction of the directors.

INDIA RUBBER, GUTTA PERCHA & TELEGRAPH WORKS CO. (LTD.)—At the meeting last week Major L. Darwin stated that as it was the half-yearly meeting there were no accounts or report. He regretted that the directors, while declaring the full half-yearly dividend on the preference shares, were not also able to declare an interim dividend on the ordinary shares. The condition of the market for raw materials was abnormal during the first six months of the year and the board thought it wise to depart from their usual practice of declaring an interim dividend on the ordinary shares on this occasion. During October last the price of the highest grade Para rubber varied from 5s. 10d. to 7s. 1d. per lb.; at the end of December it was 5s. 6d. and in the early days of March it rose to 7s. 2d. They would, therefore, understand how difficult it was for the board, without a complete stocktaking, to decide whether or not there was a profit to divide on the past half-year's earnings. Quoting from an American journal on the position of rubber, Major Darwin said it was to be hoped that, in the interest of the manufacturer, the fall in prices might become less rapid, so that stocks might be realised at a profit. One, however, had always to face the possibility that even existing prices would not be maintained, because ordinary production and consumption did not justify them. The amount of business whih the company had done had been quite satisfactory, and the board thought their worst troubles were over; the principal anxiety that remained being the possibility of obtaining remunerative prices for the stock in hand, and in process of manufacture. However, special attention was being paid to that in the hope that the financial year as a whole would show the results which they all desired. Their sales of goods into the composition of which rubber did not enter, were quite normal, but appreciably better than was the case at the corresponding period last year.

A resolution, sanctioning the payment of an interim dividend of 5s. per share (less tax) on the preference shares was approved.

MARCONI INTERNATIONAL MARINE COMMUNICATION CO. (LTD.)—At the meeting last week Mr. G. C. Isaacs (who presided) stated that the company held an exclusive licence from Marconi's Wireless Telegraph Co. for the rights to instal and work their system of wireless telegraphy on board merchant and pleasure vessels of certain countries, including Great Britain. The number of telegraph stations installed under these rights had increased from 145 in the previous year to 250 at the date of the report, and had since further increased to 303. The directors expected that at the end of the current year the stations at work upon the high seas would be about 400. Many new coast stations had been, and were being, erected in all parts of the world, while a quite considerable revenue was derived from communications between ship and ship.

MADRAS ELECTRIC SUPPLY CORPN. (LTD.)—The directors' report for 1910 (the first complete year of working since the opening of the generating station) states that 1,882,787 units of electrical energy were sold, compared with 267,568 units in 1909. There are 719 consumers (against 355) and the equivalent connections in 8 c.p. lamps 75,329 (against 29,296). Gross revenue was £17,454 (against £5,057). During the year 2,611,061 units were generated and distributed at an average cost of 1·08d. per unit, and the board consider this satisfactory. Applications from new consumers for current for power and lighting continue to be received in satisfactory numbers. The board have appointed Messrs. Merz & McLellan as consulting engineers to the company.

METROPOLITAN DISTRICT RAILWAY CO.—At an extraordinary meeting on Monday the shareholders approved the agreement entered into by the company and the London Electric Railway Co. for acquiring the Lot's-road generating station of the Underground Electric Railway Co. The Bill authorising the transfer of the undertaking has already passed Parliament.

PUEBLA TRAMWAY, LIGHT & POWER CO.—The directors, in their siderable improvement in the results compared with previous years, the report for the year ended Dec. 31, 1910, state that there has been a connet profits in Mexico having been £61,677, against £48,677 for 1909, an increase of 26 per cent. After meeting expenses and interest, the balance profit for the year was £5,441. The gross and net receipts of the light and power department continue to show satisfactory increases. The tramway receipts show a decrease owing to abnormal trade conditions and to unusually heavy expenditure on maintenance. The growing demands of the City of Puebla, the absorption of the company's present available supply of power, and the necessity (under the company's concessions) of providing 16,500 H.P. within the city boundaries by 1913, have rendered it imperative for the directors to provide funds for the development of the Tuxpango Falls, and it is proposed to take power to create an issue of $3,000,000 5 per cent. prior lien bonds, with the right to increase to an amount not exceeding $6,000,000.

ROYCE (LTD.)—The directors' report states that, after providing for all trade expenses, depreciation, but before providing for debenture interest or crediting interest received from investments, the year's trading has resulted in a profit of £4,607. Interest on investments (£2,930) and profit on sale of an investment (£7,631) brings the total to £15,169. Deducting debenture interest (£650), the total profit was £14,519, which, with £766 brought forward, makes £15,285. £739 is transferred from reserve, and it is proposed to pay a 6 per cent. preference dividend for the year to March 31 less tax (£1,975) and arrears of dividend on preference shares (seven years), absorbing £13,824, carrying forward £224.

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON (LTD.)—Sir E. Speyer presided at an extraordinary meeting on Monday when resolutions sanctioning the sale of the company's Lot's-road power station to a joint committee of the Metropolitan District and London Electric Railway Companies was approved.

NEW COMPANIES, MORTGAGES AND CHARGES, &c.

NEW COMPANIES.

ANGLO-FOREIGN CONSTRUCTION SYND. (LTD.) (116,590.)—Reg. July 1, capital £3,000 in £1 shares to work and develop lands, railways, tramways, electric lighting systems, electric and other power installations and works, &c. Private company. Reg. office: 75 and 76, Lombard-street, London, E.C.

BRITISH ARC WELDING CO. (NORTH EAST COAST) (LTD. (116,553.)—Reg. June 30, capital £22,000 in £1 shares, to take over a process for electrical welding under a grant or licence given by the British Arc Welding Co. to R. F. Brigham and R. Cowan. Private company. First directors: R. F. Brigham and R. Cowan (managing directors for 10 years). British Arc Welding Co. have right to one nominee on board.

CORONA LAMP WORKS (LTD.) (116,527.)—Reg. June 23, capital £2,000 in £1 shares, to carry on the business of manufacturers of and dealers in electric lamps, fittings, bells, batteries, accumulators and electrical accessories, &c.; to acquire the business carried on as the Corona Lamp Works Co. and to adopt an agreement with G. N. Ogilvie. Private company. First directors: G. N. Ogilvie (chairman and managing director) and A. N. C. Mackley. Reg. office: 10, Ascham-street, Kentish Town, London, N.W.

DICKS (LTD.) (116,483.)—Reg. June 24, capital £5,000 in £1 shares, to take over the business of electrical, sanitary, motor and general engineers, ironmongers, &c., carried on by P. Dicks and J. Dicks at Winchester. First directors: P. Dicks (manager) and J. Dicks. Reg. office: 149, High-street, Winchester.

F. G. EDEY & CO. (LTD.) (116,551.)—Reg. June 29, capital £3,000 in £1 shares, to take over part of the assets of the business carried on by F. G. Edey & Co., and to carry on the business of electrical engineers and contractors, suppliers of electricity, &c. Private company. First directors: F. E. Edey and D. Edey. Reg. office: 25, Warwick-lane, London, E.C.

KIRKALDY & KEMP (LTD.) (116,577.)—Reg. June 30, capital £3,000 in £1 shares (1,000 6 per cent. cumulative preference), to take over the business of consulting engineers, motor garage proprietors, æronautical, electrical and general engineers, &c., carried on as Kirkaldy & Kemp. Private company. First directors: A. H. Kirkaldy, A. F. Kemp and A. Hehner.

SWITCH-ON-GAS LIGHTING SYND. (LTD.) (116,586.)—Reg. June 30, capital £1,100 in 1,000 ordinary shares of £1 each and 2,000 deferred shares of 1s. each, to take over from A. H. Nicholson, A. W. Brooking and C. Isaac the benefit of two inventions for improvements in electrically-operated valves, and to carry on the business indicated by the title. Private company. First directors: A. W. Brooking and C. Isaac.

W. C. TACKLEY & CO. (LTD.) (116,522.)—Reg. June 27, capital £500 in £1 shares, to carry on the business of electrical and mechanical engineers, electricians, manufacturers of and dealers in electrical equipment and machinery, &c. Private company.

MORTGAGES AND CHARGES.

ENGLISH ELECTRICAL CO. (LTD.)—Issue, on June 21, of £750 debentures, part of a series of which particulars have already been filed.

RECEIVERSHIP.

MAGNETO CO. (LTD.)—C. H. McPherson, 35, Newhall-street, Birmingham, ceased to act as receiver or manager on Dec. 31, 1910.

CITY NOTES.

MEMORANDA (July 6).—Bank rate 3 per cent. (March 9, 1911.) Price of silver, 24 7/16d. per oz. Consols 78⅛—78⅜ for money; 78⅛—78⅜ for account. Consols Pay Day, Aug. 2; Stock and Shares Continuation Days, July 12 and 26; Ticket Days, July 13 and 27; Pay Days, July 14 and 28; Mining Shares Carry Over Day, July 11.

PRICES OF METALS (London).—*Copper*, cash, 56⅛; three months 57. *Lead*, English, 13⅞—13⅝; Foreign, cash, 13⅛, two months, 13½. *Spelter*, 24⅜. *Tin*, English, 192½—195½; Foreign, cash, 195½; three months, 189. *Iron*, Cleveland, cash, 46/4, three months, 47/1.

BRITISH INSULATED & HELSBY CABLES (LTD.)—Warrants for interest on the 4½ per cent. first mortgage and 5 per cent. mortgage debenture stock have been posted.

DUBLIN UNITED TRAMWAYS CO. (LTD.)—The directors have declared a dividend for the half-year ended June 30 at the rate of 6 per cent. per annum (less tax) on both preference and ordinary shares, after setting aside £4,000 for renewal of cars and £2,000 accident insurance reserve, and carrying forward £9,564.

MADRAS ELECTRIC TRAMWAYS (1904) (LTD.)—The traffic receipts for the fortnight ended June 30 were R.20,069 (increase R.2,538). Aggregate from Jan. 1, R.261,291 (increase R.19,216).

MEXICAN LIGHT & POWER CO.—The directors have declared a quarterly dividend of 1 per cent.

R. WAYGOOD & CO. (LTD.)—The profit for the year ended March 31, including £2,665 brought forward was £23,395. A further sum of £1,000 is placed to reserve, and the directors recommend a final dividend of 7 per cent. per annum for the six months to March 31, making 6 per cent. for the year, leaving £3,395 to carry forward.

NOTES.

Patent Procedure.

It is seldom that a piece of modern legislation produces all the results which its framers desired, and sometimes it has an effect which is neither desired nor intended. A case in point is the Patents and Designs Act of 1907, one of the objects of which, according to the author of the measure, was "to benefit the poor working man inventor." It was proposed to effect this by making patent procedure cheaper, simpler and more expeditious. It is, however, doubtful whether the poor inventor has reaped any advantage from the Act; in one respect his position is certainly worse, for he has found that his patent is not so readily saleable as it was before the passing of the Act, and he is more dependent than ever upon the manufacturer and the capitalist for exploiting his invention. One of the reasons for this is the delay by the Law Officers of the Crown in hearing appeals from decisions of the Comptroller-General. The 1907 Act not only maintained the old procedure in this respect, but extended the right of appeal to the Law Officers. Owing to various causes, but principally to the increase of the public duties of the Attorney-General and the Solicitor-General, the work entailed by these appeals has fallen into arrear, and the average period which elapses between the date of the Comptroller-General's decision and the hearing of the appeal has more than trebled within the last few years.

This delay has become so serious that patentees, patent agents and manufacturers are complaining of it seriously. The Chambers of Commerce and other public bodies have also taken up the matter, and by way of a remedy an alteration of procedure is suggested, namely, the substitution of a judge of the High Court for the Law Officers of the Crown in all cases of appeal from decisions of the Comptroller-General. We think the proposal an excellent one, because, apart from the question of delay—which is, no doubt, serious enough in itself—it would result in more certainty and uniformity in patent procedure. The judge who usually tries actions for infringement of patents, &c., would be more expeditious in hearing these appeals, and his decisions would probably have greater authority. It is undoubtedly very desirable that some change should be made, for so long as there is any uncertainty about a patent it is unsaleable and manufacturers are not likely to entertain any proposal for developing it.

Electrical Accessories in America.

A feature of the Annual Convention of the National Electric Light Association of America is the presentation of a number of reports upon subjects of widespread interest. These reports are drawn up by committees of the Association and are based upon information collected during the past year. To give some idea of the completeness with which this work is carried out we may mention that the Committee reporting on electric heating, refrigeration, &c., found it necessary to appoint four sub-committees to deal with domestic and commercial heating appliances, cooking appliances, fancy lighting appliances, and domestic power appliances respectively. From the report we notice that of electric heating appliances the flat-iron is considered to be the greatest revenue-producer, averaging about 2s. 9d. per month. When it is realised that last year

Digitized by Google

a quarter of a million flat-irons were sold in the United States and Canada, some idea can be gathered of the importance of this branch of the electric supply business. The difference between the results just mentioned and the poor achievements in this country can only be ascribed to the more extensive publicity campaign which has been a feature of the American electric supply business for several years. This view is strengthened by the fact that the electric heating pad is stated to be next in popularity to the flat-iron. Another direction in which evidently there is considerable scope for development is in the use of electrically heated tools, &c. The report mentions that some supply companies obtain a revenue of from £4,000 to £10,000 per annum from this source alone. Although electric cooking is not able to show results comparable with those mentioned above, the replies received by the Committee from the central stations showed that the prospects are encouraging.

The "G.B." System at Lincoln.

THE annual report of Mr. S. CLEGG, city electrical and tramway engineer, upon the working of the Lincoln Corporation tramways during the year ended March 31st last, will not prove very encouraging to other engineers desirous of adopting a surface contact system. A marked increase has taken place in recent years in the cost of maintaining the electrical equipment of the track, last year's figure of £141 having more than doubled on the present occasion. Of the total of £263 directly attributable to the "G.B." equipment, the renewal of stud heads accounts for £155. It should be noted, however, that this item was foreseen, the estimated life of the studs having been reached. The renewal of carbons also costs about £70. Mr. CLEGG anticipates that when the re-carboning has been completed during the present year, the cost of maintenance should fall to a much lower level; indeed, he looks forward to this item not averaging more than the estimated £90 over the period of 10 years covered by the "G.B." Co.'s guarantee. The initial years of an experimental equipment such as that at Lincoln inevitably bring to light unforeseen repairs and alterations; and this case serves to emphasise the futility of basing the cost of repairs of any undertaking on the first few years' working.

Electricity in Mines.—A circular, signed by Sir Henry Cunynghame, Permanent Assistant Under-Secretary, has been issued from the Home Office in the following terms :—

I am directed by the Secretary of State to say that he has received a number of objections from owners of mines under the Coal Mines Regulation Acts to the new special rules relating to the installation and use of electricity which have been proposed to them. It has consequently been necessary for the inspector of mines in charge of each district to appoint an arbitrator in the matter, in pursuance of the provisions of sec. 47 of the Coal Mines Regulation Act, 1887, and each of the inspectors has accordingly appointed Mr. James Swinburne, 82, Victoria-street, London, S.W., as arbitrator in the matter of objections to the rules received in respect of mines in his district. The Secretary of State trusts that it may be possible to settle the matter without arbitration, but as objection has been formally made to the rules, it is necessary, under the Act, that an arbitrator should be appointed.

Latakia—Palura	May 26, 1910
Zanzibar—Mombasa	July 11, 1911
Bathurst–Bissao	July 11, 1911
Guam—Manila	July 12, 1911

1,500-Volt Railway Electrification.—The "Engineer" states that a contract has been placed for the electrification of two sections of road on the Piedmont Traction Co.'s system in North Carolina and South Carolina. This is the first railway in America to be equipped with apparatus for 1,500-volts current, although a number of lines are now operated at 1,200 volts. Power will be purchased from the Southern Power Co. and fed to the lines through motor generators in sub-stations.

Civil List Pensions.—A list of pensions granted during the year ended March 31, 1911, and payable under the provisions of Sec. 9 (1) of the Civil List Act, 1910, has been issued, and among the recipients is Mrs. Alice Augusta Gore-Fysh, who has been granted a pension of £50 "in consideration of the services to chemical and physical science of her father, the late Dr. George Gore, F.R.S., and of the circumstances in which she has been placed by his disposal of his fortune for the furtherance of science."

Safe Tramcar Step.—The "Electric Railway Journal" states that a device which prevents a car from being started when a passenger is mounting or dismounting is being tested on the lines of the Portland Railway, Light & Power Co. It consists of a hinged step which depresses about ½ in. when a weight of from 5 lb. to 10 lb. is placed upon it. This breaks an electric circuit connected with the contactor so that the latter fails to close. The device is arranged, however, so that the motorman is able to reverse his car regardless of the condition of the step.

Short-Circuit Currents.—In the report of the Committee on Electrical Apparatus to the National Electric Light Association at their recent Convention much attention is paid to the use of reactance coils to limit the current produced by generators on short-circuit. In the case of the 20,000 kw. units for the Commonwealth Edison Co. the series reactance limits the short-circuit current to from 12 to 15 times the normal full-load current. The reactance is formed largely by the auto-transformers used to increase the generator E.M.F. of 4,500 volts to the 'bus bar E.M.F. of 9,000 volts. The normal efficiency of the plant is not thereby lowered, while its performance under abnormal conditions is much improved. As a result of short-circuit tests made upon certain 12,000 kw. generators, the Committee recommend that the use of reactance to limit short-circuit currents be given most careful consideration. Reactance should be inserted in series with the armature of low-reactance turbo-generators, while all new equipment should be purchased with as high reactance as is compatible with good design.

Portugal.—The trade of Portugal for 1910 shows (says a Consular report) a yield of 1,200 tons of wolfram (tungsten) ore per annum, and makes the country the largest producer of this ore in Europe. Concessions for the working of the mines are mostly in French hands, but about half the total supply is obtained from surface finds by the country people. The ore contains about 65 per cent. tungstic acid.

Extensive finds of uranium ores, along with radio-active material, have been made, and it is claimed that the Portuguese ore is more suitable for the extraction of radium than any other known. The radio-active material is found in the gangues accompanying the uranium ores, which contain about 3 per cent. uranium oxide, and this by simple washing can be concentrated to about 20 per cent. As much as 0·05 per cent. radio-active material has been traced in the form of actinium, polonium and radium bromide salts.

Certain obstacles to the commercial development of Portugal may be removed (continues the report) and, if so, Mr. Gaisford (of the British Legation, Lisbon) suggests that British capital might find a profitable outlet in the equipment of works for the generation of electrical energy by water power, and the construction of electric tramways and railways.

New Inventions by Tesla.—At a recent meeting of the New York Section of the National Electric Light Association, Mr. Nikola Tesla outlined some startling developments as likely to result from his researches. From an account in the "Electrical Review and Western Electrician" it seems that his system for wireless transmission of energy comprises five distinct inventions, which he stated to be a transformer, a magnifying transmitter, the art of "individualisation," a receiver for condensing the energy, and stationary waves. The last mentioned he considered the most important. Continuing, Mr. Tesla

Digitized by Google

said that the most marvellous discovery of his life was a means of projecting energy into space, absolutely without loss. In fact, a force impressed at one point could be made to increase with the distance. In the concluding portion of his address Mr. Tesla described a new form of steam turbine for converting thermal energy into mechanical energy, for which he claimed that the limiting efficiency was 99 per cent., as against 65 per cent. in present designs. He also stated that the new type would develop 10 H.P. per lb. weight. We trust that the report in our contemporary is correct.

A "New War Office Wireless System" is the subject of Journalistic enthusiasm as follows :—

Interesting experiments in wireless telegraphy are being carried out in the neighbourhood of Dorking by a party of Royal Engineers from Aldershot. Apparatus of a new type, known as "War Office Secret Patent No. 5," is being tried for the first time, and the results obtained so far have been highly satisfactory. All kinds of messages have been picked up, many of them in code. Greenwich time signals, it is curious to note, have been received from a German station.

This is vague to a degree. It is not so surprising as the daily papers seem to imagine that "all kinds of messages" are picked up "in code," and it is not really curious that "Greenwich time signals have been received from a German station." What a fascination these wireless developments continue to have for the average journalist !

Automatic Telephony.—We understand that a trial of automatic telephones is to be made at the Post Office Exchange at Epsom, Surrey, which is shortly to be changed over to automatic working. The order for the work has already been given and the automatic exchange will occupy a room below the present exchange. When the installation is complete all the present subscribers will be changed over to the automatic exchange in which provision will be made at first for about 500 lines. We understand that the full automatic service at Epsom will be in use about the end of the year, or early next year. On the success of this experiment and upon the results obtained at the automatic exchange which is to be installed in the General Post Office itself for the use of the staff, the future of the automatic system in this country will largely depend.

Recent Developments in Train Lighting.—In a Paper on this subject read before the Chicago section of the Illuminating Engineering Society Mr. C. R. Gilman, of the Chicago, Milwaukee & St. Paul Railway Co., said that the use of shades over bare lamps was the greatest recent general improvement in electric train lighting. Next to this in importance was the intelligent use of reflectors, this often involving a marked reduction in the number of lamps necessary to give a required illumination. In the "West" most railways used the head-end system of train lighting, installing a generating set in the baggage car next the engine and supplementing this source of energy by storage batteries. Tungsten lamps now played an important part in this lighting, a pressure of 64 volts being generally adopted. Mr. Gilman also mentioned that compressed gas was not being ousted by electric lighting, although the latter was preferred by the travelling public.

Furnace Economy.—The "Electrical World" draws attention to a bulletin issued by the United States Bureau of Mines in which the apparatus and methods in use by the Bureau for the sampling and analysis of furnace gases are described. The authors, Messrs. J. C. W. Frazer and E. J. Hoffman, say in their preface that the furnace conditions prevailing both in small plants and in large industrial establishments in America are frequently far from satisfactory. If such conditions are to be improved, they must be more thoroughly understood, and means must be found to ensure complete combustion of the fuel and yet to permit operation with such an excess of air as will result in the greatest efficiency. In this work the services of the chemist are indispensable. A very important problem is the determination of the small percentage of unburned combustible matter that escapes from the furnace in the flue gases. Under ordinary circumstances so little as 0·1 per cent. of unburned combustible matter in a furnace gas is equivalent to about 1 per cent. of the fuel used, and for the determination of such small percentages of gas more accurate and refined methods are required than have ordinarily been available hitherto.

"Lifting Magnets in Foundries."—In the course of a Paper read on this subject by Mr. H. F. Stratton, before the American Foundrymen's Association, and reported in "Metallurgical and Chemical Engineering," the author gave the following estimate of cost for a foundry melting 35 tons of metal daily, 300 days in the year. The cost of the magnet and crane installation, with a lifting capacity of 1,350 lb. of pig iron, is £800. A crane and a magnet of this size can handle 35 tons per hour at an operating cost (wages, fuel and oil) of 0·7d. per ton. The annual depreciation on the £800 equipment at 12 per cent. would be £96, and as 35 tons handled twice per day for 300 days represent 21,000 tons handled annually, the depreciation cost on this tonnage basis is 1·2d. per ton. This brings the total cost of handling, including wages, fuel, oil and depreciation up to 1·8d. per ton. It appears that 5d. per ton is a fair figure to assume for the cost of loading or unloading pig by hand, and on this basis the saving would be 33 per cent. on an investment of £800. To sum up, a foundry melting 35 tons of metal daily can instal both a crane and a magnet, and expect a return upon the investment, after allowing all charges, of more than 30 per cent. If it happens that a foundry is already equipped with either an electric or locomotive crane, a magnet can then be installed on a very profitable basis when the tonnage to be handled is considerably less. For instance, if an assumption be made that a foundry melts 20 tons daily, and that a magnet be installed on an existing crane, the cost of the magnet being about £180, then the cost of handling per ton, including wages, fuel, oil and depreciation on the magnet, is about 1·2d., which would represent a saving in this foundry of about £185 each year, or more than 100 per cent. on the investment. Handling scrap, in general, will be more expensive than handling pig iron, whether it be done by hand or by magnet, but the advantage in favour of the magnet is more marked in the case of scrap than in the case of pig.

Results of 1,200-volt Direct-current Operation.—In February, 1908, the Washington, Baltimore & Annapolis Electric Railway, comprising 96·33 miles of single track, was opened for combined single-phase and direct-current operation. It was soon found that the complicated equipment required to operate with both systems was not satisfactory for the development of a reliable and profitable service. It was therefore determined to replace the combination equipment by a 1,200-volt direct-current system. This change was completed in February, 1910. The "Electric Railway Journal" states that the installation of the direct-current equipment produced immediate economies in current consumption and greater reliability of service. Furthermore, successful operation for over a year has demonstrated that the maintenance of 1,200-volt direct-current equipment offers no greater difficulties than standard 600-volt apparatus. The records of the Company show that there has been a noteworthy decrease in those operating costs which are affected by the character of the equipment. Comparing the last six months of 1909 and 1910 respectively, it appears that whereas the maintenance of the alternating-current passenger cars cost 0·42d. per car-mile, with the direct-current passenger cars the same item amounted to only 0·09d. per car-mile ; whilst the maintenance of the electrical equipment of the cars was reduced from 0·18d. to 0·12d. per car-mile. The total operating expenses for the semi-annual periods named were reduced from 11·89d. per car-mile to 9·5d. per car-mile. Still better results are shown in the comparative statement for January, 1911, and January, 1910, which shows an increase of 17·37 per cent. in gross earnings, a decrease of 1·38 per cent. in operating expenses and an increase of 70·1 per cent. in net earnings. When single-phase rolling stock was in service electrical causes were responsible for 33·1 per cent. of the detentions, amounting to a delay of 1,186 minutes. Under the 1,200-volt system the same causes were responsible for 19·12 per cent. of the delays, but the total number of minutes' detention was reduced in much greater

Digitized by Google

proportion, amounting to 215 minutes only. Another significant item is that of "power off." The delays from this cause were lowered from 586 minutes to 62 minutes. The total minutes detention from all causes was reduced from 3,579 to 1,124. A portion of these delays, however, is unavoidable, because the Company operate over foreign lines in Baltimore and Washington.

Central Stations and Contractors.—The encroachment of the supply authorities on the work of electric contractors is evidently not unknown outside this country, for in an address at the recent annual meeting of the Indiana Electric Contractors' Association, Mr. C. C. Perry, president of the Indianapolis Light & Heat Co., advised very strongly that lighting companies and electric contractors should keep within their own lines of business, while co-operating with each other for business success. He deplored the fact that there is a tendency on the part of lighting companies in some places to sell material and to do wiring. This should be stopped, he said, as it was the business of the electrical contractor to sell material and wire the buildings, and the lighting company should confine itself to making and selling electricity.

Electric Smelting at Trollhätten.—The British Minister at Stockholm has recently drawn attention to the report of the Swedish "Jernkontoret," or Iron and Steel Institute, for 1910. This contains some particulars of the results of the experiments made at Trollhätten in the smelting of iron ore by electricity provided at a cheap rate from the Government works. The plant cost £17,800 and smelting operations were commenced in November, 1910. According to the report, the results obtained show definitely that the question of smelting iron ore by electricity is solved even from the economical standpoint, if electricity is provided at low rates. Better results are to be expected if arrangements are made for a more effective circulation of gas, and it seems probable that this is feasible. So far, it appears that the experiment has paid expenses, and that in the present year better results are expected. After October, 1912, the Government intend to raise the charge for the supply of electricity. The Committee estimate that the smelting works cannot be a commercial success if the price exceeds the present rate of 40 kroner (£2. 4s. 5d.) per kilowatt per annum. The Government have offered to supply 6,000 electric horse-power for 10 years at 40 kroner per kilowatt, and for the following 10 years at 45 kroner. The question of continuing the experiment under these conditions is now awaiting the Society's decision. During the five months of operation 29 consignments of ore were used. The result of the operations was 413 kgs. of charcoal per ton of iron, and the consumption of electricity was ¼ kilowatt per year per ton. It was found on analysis that the electric product was practically free from remains of ores and cinders and oxidised iron taken up again by the furnace blasts. Silica-bearing electric iron is too slow for the Martin steel furnaces, as the want of oxygen makes itself felt. Foreign firms have reported that wire made from electric iron is fully as good as other qualities. Experiments have been made with satisfactory results at the works of Fagersta, Eskilstuna, Hagfors and Munkfors. The above statements have called forth a rejoinder in the Swedish Press to the effect that even if the gas is better regulated there will be no advantage over smelting with ordinary coal; that there is an immense and wasteful consumption of electric energy; and that the result is not more than 3 tons per horse-power-year. It is, of course, possible at Trollhätten, where electricity is provided cheaply, to smelt the iron without loss, but, says the writer in the Press, it is useless to talk of competing with coal smelted iron. The electric smelting cannot be made to pay where electric energy costs more than 36 kroner per horse-power-year. The only place where electric power could be supplied at so low a price is in the north, and there is a danger that the Grangesberg Company may smelt iron ore and export it to England; the freight to South Sweden would be prohibitive. The director of the works admits in reply that it would certainly not be possible, where there is a great demand for electricity for lighting, &c., to supply cheap electricity for smelting purposes, but in the north of Sweden where there is an immense reserve of water-power and great deposits of high-grade ore, the new process ought to be profitable.

Current Topics.

Subjects of current interest dealt with in this issue include the following:—

Messrs. J. W. E. Elliott and C. S. Parsons contribute an article on "Experiments on a Mercury Arc Converter."

We conclude our description of the Dunston power station of the Newcastle-on-Tyne Electric Supply Co.

We also continue our account of the Papers and Discussions at the Education Conference organised by the Institution of Civil Engineers.

An abstract is given of a Paper on "Some Recent Developments in Railway Telephony," read by Mr. G. Brown before the American Institute of Electrical Engineers.

An automatic telephone exchange is to be installed at Epsom.

Sheffield Council are recommended to authorise the expenditure of £61,000 on additions to generating plant, &c.

Interesting particulars of electrical progress in France are given in abstracts of Consular reports.

Municipal Loans.—An inquiry was held on Wednesday into the application of Doncaster Corporation for permission to borrow £12,0 for extensions of the electricity undertaking.—Sheffield Corporation are recommended to expend £61,000 on further extensions of plant.

Legal.—The Railway and Canal Commission continued this week the hearing of the case brought by the National Telephone C against the Postmaster-General in connection with the transfer the Company's undertaking to the Post Office. On Tuesday it was announced that the parties had made an arrangement as to the points in dispute.

The Court of Appeal on Tuesday dismissed the appeal of the London Electric Supply Corporation from the judgment of Mr. Justice Joyce in the action brought by the company against the Westminster Electric Supply Corporation as to the supply of electricity in portion of Westminster. Mr. Justice Joyce's judgment was reported in THE ELECTRICIAN of April 14 (page 30.)

It is announced that cross-actions have been lodged by the Marconi Companies against the Lodge-Muirhead Syndicate and by the Lodge-Muirhead Syndicate against the Marconi Companies for infringement of patents.

Companies' Reports.—An interesting report of the affairs of the Marconi Wireless Telegraph Co. is issued, showing a net profit according to the accounts, of £60,513. It is claimed that the successful working of the Company's trans-Atlantic service demonstrates its practical value. The report also mentions that a new and valuable invention, consisting of a duplex system adapted to wireless telegraphy, has been made by Mr. Marconi, who has applied for patents for his invention. It is announced that the Belgian Marconi Co. has declared a dividend of 10 per cent., the French Co. a dividend of 5 per cent., the Marconi International Marine Communication Co. (of which the parent company owns nearly the whole of the shares) a dividend of 5 per cent. The parent company declares the usual dividend on the cumulative 7 per cent. Preference shares, but this is subject to the approval of the general meeting about to be held. They also declare an interim Preference dividend up to June 30. A dividend on the Ordinary shares, it is stated, is also about to be declared.

The reports of the directors of the Electric Construction Co., and the Bombay Electric Supply and Tramways Co. are also abstracted.

OBITUARY.

J. E. NEALE.—The Indian Press recently reported that Mr. J. E. Neale, M.I.E.E., had died of empyema in the St. George's Hospital, Calcutta. Mr. Neale was telegraph superintendent of the Great Indian Peninsula Railway, and was the inventor of block signalling apparatus which was used not only on the Great Indian Peninsula Railway, but also on the Bengal-Nagpur, Eastern Bengal, Indian, Indian Midland and other lines.

PERSONAL NOTE.

Mr. H. V. Browne.—The report of the Executive Committee of the British Chamber of Commerce for Spain brings us news of the departure from Barcelona of Mr. H. V. Browne, who has been for many years the representative in Barcelona of the Direct Spanish Telegraph Co., and who has been vice-president of the Chamber since its establishment. Mr. Browne is taking up his quarters in Marseilles, where he conducts the Direct Spanish Co.'s Marseilles branch as from July 1.

The President of the Chamber (Mr. G. R. Smither), at a recent meeting, expressed the great regret of the members at the loss sustained by the Chamber from the departure of Mr. Browne, whose many cheerfully rendered services had, he said, endeared Mr. Browne to them. A hearty vote of thanks was passed unanimously to the late vice-president of the Chamber for his good work and for his enthusiasm for the Chamber's welfare.

Mr. Browne, in expressing his gratitude for the kindness shown him, said he should always entertain feelings of high regard for the members of the British Chamber of Commerce for Spain, and should from Marseilles take an interest in its future success. A banquet took place subsequently at which H.B.M.'s Consul-General, Mr. J. F. Roberts, occupied the chair, and spoke feelingly of Mr. Browne's distinguished services to the British colony in Barcelona.

APPOINTMENTS VACANT AND FILLED.

A lecturer in electrical engineering is required at the East London College (University of London) for September next. Workshop experience essential. Commencing salary £160. Particulars from Prof. J. T. Morris. Applications to the Registrar of the College by Monday, July 31. See advertisement.

Test room assistants are required for testing and calculating a.c. and d.c. ammeters, voltmeters and wattmeters. See advertisement.

Several electrical fitters, experienced in fitting electrical installations in ships. Wages 36s. Applications to the Electrical Engineer, H.M. Dockyard, Devonport. There is also a vacancy for a supernumerary switchboard attendant at the Dockyard; wages 35s. per week. See advertisements.

The position of instructor in the electrical engineering laboratories of the City and Guilds of London Technical College, Finsbury, is vacant by the resignation of Mr. B. Betts. Salary £100 per annum. Particulars from the Principal. See advertisement.

Messrs. Dick, Kerr & Co., Abchurch-yard, London, E.C., require foremen for the glass blowing, exhausting and filament preparing departments of their lamp works. See advertisement.

A lecturer in physics and mathematics (£150, rising to £250 per annum) and a visiting teacher of mathematics (five evenings per week at 15s. per evening) are required for the L.C.C. Hackney Technical Institute. Applications (on Form T. 17) to the Education Offices, Victoria Embankment, W.C., by 11 a.m. July 21.

An assistant lecturer and demonstrator is required in the mathematics and mechanics department of Sunderland Technical College. Salary £150. Applications to Mr. Herbt. Reed, 15, John-street, Sunderland, by July 31.

A science master is required by Leicester County Council for the King Edward VII. Grammar School, Melton Mowbray. Commencing salary £140. Applications to Mr. R. Stuart Smith, Thornhill, Todmorden.

A demonstrator or assistant lecturer is required in the physics department of the University College of Wales, Aberystwyth. Salary £150. Applications to the Registrar by Aug. 24.

Battersea (London) Council require an additional commercial assistant for their electricity department. Salary £2 per week and commission. Applications by noon July 24.

The Governors of Heriot-Watt College, Edinburgh, require an organiser of technical education. Salary £300 per annum. Applications to the Clerk, 20, York-place, Edinburgh, by July 24.

An assistant science master is required for Waterford Central Technical Institute. Salary £100, rising to £130. Particulars from the Principal. Applications by noon, July 29.

Mr. L. Simons, B.Sc., has been appointed demonstrator in physics at Armstrong College.

INSTITUTIONS AND SOCIETIES.

Royal Society of Arts.—The Council on Monday elected Lord Sanderson, G.C.B., chairman for the year 1911-12. Lord Sanderson has been a member of the Society for over 30 years.

Institution of Electrical Engineers.—The annual conversazione was held last Thursday evening, July 6th, at the Natural History Museum, South Kensington. The guests, among whom were Lord Justice Buckley, Sir W. J. Howell, K.C.B., Sir S. Hutchinson, Rear-Admiral A. G. H. W. Moore, R.N., the Hon. Sir R. J. Parker, Sir W. Ramsay, K.C.B., F.R.S., and Sir W. Wilkins, K.C.M.G., were received by the President, Mr. S. Z. de Ferranti, and Mrs. Ferranti. We were surprised at the somewhat small attendance as compared with previous years, due probably to the hot weather. The usual programme of music was provided, viz., the string band of the Royal Engineers and the Alexandra Ladies' Quartette.

Tramways and Light Railways Association.—The "Journal" for July is a special "Congress" number, the four Papers which are being read yesterday and to-day at the Edinburgh Congress being given in full.

EDUCATIONAL NOTICES.

University of Sheffield.—The faculty of applied science comprises the departments of engineering, metallurgy, coal mining and architecture. The courses in engineering or in metallurgy extend over three years and prepare respectively for the degree of B.Eng. or B.Met. of the university. The lecture courses commence Oct. 4, and the technical laboratory courses on Sept. 18. Prospectuses and other particulars from the registrar, Mr. W. M. Gibbons.

University of Manchester.—A complete theoretical and practical training is given at this University to students preparing for the higher positions in the electrical engineering profession. The subject may be taken as part of the course preparing for the B.Sc. degree in both the Honours Schools of Engineering and of Physics, and a special course has also been arranged extending over three years, and preparing for the certificate in electrical engineering. The John Hopkinson laboratories (which are being extended) and dynamo house are fitted with modern electrical machinery, and good facilities are offered for educational and research work. The 1911-1912 session commences on Oct. 3. Prospectuses may be obtained from the Registrar.

City and Guilds Technical College.—This college provides a scientific training for students preparing to become electrical and mechanical engineers or chemists, and for engineering pupils who desire to supplement their practical training by a two years' course of instruction in the principles of engineering science. The instruction is mainly given in the various laboratories, most of which have been recently re-equipped. The subjects of the entrance examination are mathematics and English, but the matriculation of any British University is accepted. The courses in electrical and mechanical engineering cover a period of two years and those in chemistry three years. There are also arrangements for three-year courses in engineering. Particulars at the college, Leonard-street, City-road, London, E.C., or from the City and Guilds of London Institute, Gresham College, Basinghall-street, London, E.C.

ARRANGEMENTS FOR THE WEEK.

FRIDAY, July 14th (To-day).

Tramways and Light Railways Association.

Congress at Edinburgh. Papers on "Notes on Tramway Problems," by Mr. C. W. Mallins (General manager, Liverpool Corporation Tramways); and "Tramways and Light Railways Legislation of the Future," by Ald. W. Ivey (West Ham Tramways Committee).

THE LONDON ELECTRICAL ENGINEERS.

Officer Commanding, Col. H. M. Leaf.

The following orders have been issued for the current week:—

Monday, July 17, to Friday, July 21, headquarters will be open from 10 a.m. to 4 p.m.

Saturday, July 22.—Sheerness Detachment will parade at Headquarters at 3 p.m. Dress: Service dress, drill order with water-bottles and haversacks. Arms will be issued before this parade.

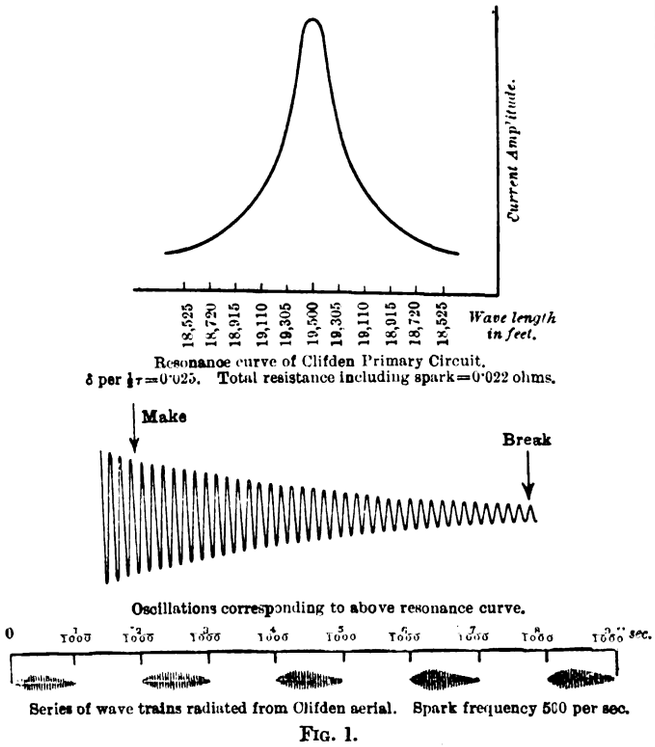
RADIO-TELEGRAPHY.*

BY G. MARCONI.

The practical application of electric waves to the purposes of wireless telegraph transmission over long distances has continued to extend to a remarkable degree during the last few years, and many of the difficulties which at the outset appeared almost insurmountable have been gradually overcome—chiefly through the improved knowledge which we have obtained in regard to the subject generally and to the principles involved. Although we have all the data necessary for the satisfactory production and reception of electric waves, we are yet far from possessing any very exact knowledge concerning the conditions governing the transmission of these waves through space—especially over long distances. Although it is now perfectly easy to design, construct and operate stations capable of satisfactory commercial working over distances up to 2,500 miles, no really clear explanation has yet been given of many absolutely authenticated facts concerning these waves. Why is it that when using short waves the distances covered at night are usually enormously greater than those traversed in the daytime, whilst when using much longer waves the range of transmission by day and night is about equal and sometimes even greater by day? What explanation has been given of the fact that the night distances obtainable in a north-southerly direction are so much greater than those which can be effected in an



Resonance curve of Clifden Primary Circuit.
δ per $\frac{1}{2}\tau$=0·025. Total resistance including spark=0·022 ohms.

Oscillations corresponding to above resonance curve.

Series of wave trains radiated from Clifden aerial. Spark frequency 500 per sec.

FIG. 1.

east-westerly one? Why is it that mountains and land generally should greatly obstruct the propagation of short waves when sunlight is present and not during the hours of darkness?

After referring to the general principles on which practical radiotelegraphy is based and the various systems which had been used by him to obtain wireless transmission, Mr. Marconi continued: At the long distance station situated at Clifden in Ireland, the arrangement which has given the best results is based substantially upon my syntonic system of 1900, to which have been added numerous improvements. An important innovation from a practical point of view was the adoption at Clifden and Glace Bay of air condensers composed of insulated metallic plates suspended in air at ordinary pressure. In this manner we greatly reduce the loss of energy which would take place in consequence of dielectric hysteresis were a glass or solid dielectric employed. A very considerable economy in working also results from the absence of dielectric breakages, for, should the potential be so raised as to produce even a discharge from plate to plate across the condenser, this does not permanently affect the value of the dielectric, as air is self-healing, and one of the few commodities which can be replaced at a minimum of cost.

Various arrangements have been tried and tested for obtaining continuous or very prolonged trains of waves, but it has been my experience that, when utilising the best receivers at present available, it is neither economical nor efficient to attempt to make the waves too continuous. Much better results are obtained when groups of waves (Fig. 1) are emitted at regular intervals in such manner that their cumulative effect produces a clear musical note in the receiver, which is tuned not only to the periodicity of the electric waves transmitted, but also to their group frequency. In this manner the receiver may be doubly tuned, with the result that a far greater selectivity can be obtained than by the employment of wave-tuning alone. In fact, it is quite easy to pick up simultaneously different messages transmitted on the same wave-length, but syntonised to different group frequencies. As far as wave-tuning goes, very good results—almost as good as are obtainable by means of continuous oscillations—can be achieved with groups of waves, the decrement of which is in each group 0·03 or 0·04, which means that about 30 or 40 useful oscillations are radiated before their amplitude has become too small perceptibly to affect the receiver. The condenser circuit at Clifden has a decrement of from 0·015 to 0·03 for fairly long waves.

The lecturer then gave a description of his well-known disc discharger, a patent for which was taken out in 1907. In this apparatus, with the frequency employed at Clifden, namely, 45,000, when a potential of 15,000 volts is used on the condenser, the spark-gap is practically closed during the time in which one complete oscillation only is taking place, when the peripherical speed of the disc is about 600 ft. a second. The result is that the primary circuit can continue oscillating without material loss by resistance in the spark-gap. Of course the number of oscillations which can take place is governed by the breadth or thickness of the side discs, the primary circuit being abruptly opened as soon as the studs attached to the middle disc leave the side discs.

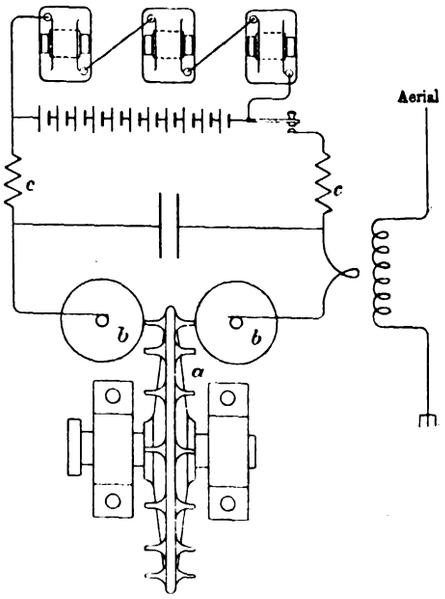


FIG. 2.—DISC DISCHARGER. (Continuous Current.)

This sudden opening of the primary circuit tends immediately to quench any oscillations which may still persist in the condenser circuit; and this fact carries with it a further and not inconsiderable advantage; for, if the coupling of the condenser circuit to the aerial is of a suitable value, the energy of the primary will have practically all passed to the aerial circuit during the period of time in which the primary condenser circuit is closed by the stud filling the gap between the side discs; but, after this, the opening of the gap at the disc prevents the energy returning to the condenser circuit from the aerial as would happen were the ordinary spark-gap employed. In this manner the usual re-action which would take place between the aerial and the condenser circuit can be obviated, with the result that with this type of discharger and with a suitable degree of coupling the energy is radiated from the aerial in the form of a pure wave, the loss from the spark-gap resistance being reduced to a minimum.

An interesting feature of the Clifden plant, especially from a practical and engineering point of view, is the regular employment of high-tension direct current for charging the condenser. Continuous current at a potential which is capable of being raised to 20,000 volts is obtained by means of special direct-current generators; these machines charge a storage battery consisting of 6,000 cells all connected in series, and it may be pointed out that this battery is the largest of its kind in existence. The capacity of each cell is 4 ampere-hours. When employing the cells alone the working voltage is from 11,000 to 12,000 volts, and when both the direct-current

* Abstract of a Discourse delivered at the Royal Institution on Friday, June 2nd.

Digitized by Google

generators and the battery are used together the potential may be raised to 15,000 volts through utilising the gassing voltage of the storage cells. For a considerable portion of the day the storage battery alone is employed, with a result that for 16 hours out of the 24 no running machinery need be used for operating the station, with the single exception of the small motor revolving the disc. The potential to which the condenser is charged reaches 18,000 volts when that of the battery or generators is 12,000. This potential is obtained in consequence of the rise of potential at the condenser plates, brought about by the rush of current through the choking coils at each charge. These coils are placed between the battery or generator and the condenser *c*, Fig. 2. No practical difficulty has been encountered either at Clifden or Glace Bay in regard to the insulation and maintenance of these high-tension storage batteries. Satisfactory insulation has been obtained by dividing the battery into small sets of cells placed on separate stands. These stands are suspended on insulators attached to girders fixed in the ceiling of the battery room. A system of switches, which can all be operated electrically and simultaneously, divides the battery into sections, the potential of each section being low enough to enable the cells to be handled without inconvenience or risk.

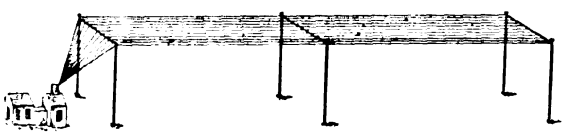

FIG. 3.

The arrangement of aerial adopted at Clifden and Glace Bay is shown in Fig. 3. This system, which is based on the result of tests that I first described before the Royal Society in June, 1906,* not only makes it possible efficiently to radiate and receive waves of any desired length but it also tends to confine the main portion of the radiation to any desired direction. The limitation of transmission to one direction is not very sharply defined, but nevertheless the results obtained are exceedingly useful for practical working. In a similar manner by means of these horizontal wires it is possible to define the bearing or direction of a sending station and also limit the receptivity of the receiver to waves arriving from a given direction.

Turning to the detrimental effect produced by daylight on the propagation of electric waves over great distances, the lecturer dealt with the generally accepted hypothesis of the cause of this, and stated that recent observations revealed the interesting fact that the effects varied greatly with the direction in which transmission was taking place; the results obtained when transmitting in a northerly and southerly direction being often altogether different from those observed in the easterly and westerly one. In regard to moderate power stations, such as are employed on ships and which in

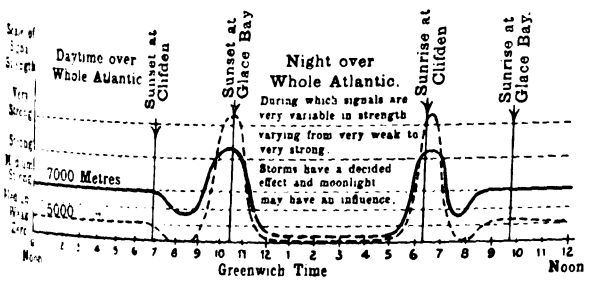

FIG. 4.

compliance with the International Convention use wave lengths of 300 and 600 metres, the distance over which communication can be effected during daytime is generally about the same whatever the bearing of the ships to each other or to the land stations, whilst at night interesting and apparently curious results are obtained. Ships, over 1,000 miles away, off the south of Spain or round the coast of Italy, can almost always communicate during the hours of darkness with the Post Office stations situated on the coasts of England and Ireland, whilst the same ships, when at a similar distance on the Atlantic to the westward of these islands and on the usual track between England and America, can hardly ever communicate with these shore stations unless by means of specially powerful instruments. It is also to be noticed that in order to reach ships in the Mediterranean the electric waves have to pass over a large portion of Europe and, in many cases, over the Alps. Such long stretches of land, especially when including very high mountains, constitute, as is well known, an insurmountable barrier to the propagation of short waves during daytime. Although no such obstacles lie between the English and Irish stations and ships in the North Atlantic en route for North America, a night transimssion of 1,000 miles is there of exceptionally rare occurrence. The same effects generally are noticeable when ships are communicating with stations situated on the Atlantic coast of America.

The diagrams Figs. 4 and 5 show the average daily variation of the signals received at Clifden from Glace Bay. The curves shown in Fig. 4 show the usual variation in the strength of these trans-Atlantic signals on two wave lengths—one of 7,000 metres and the other of 5,000 metres. The strength of the received waves remains as a rule steady during day time. Shortly after sunset at Clifden they become gradually weaker, and about two hours later they are at their weakest. They then begin to strengthen again and reach a very high maximum at about the time of sunset at Glace Bay. They then gradually return to about normal strength, but through the night they are very variable Shortly before sunrise at Clifden the signals commence to strengthen steadily and reach another high maximum shortly after sunrise at Clifden. The received energy then steadily decreases again until it reaches a very marked minimum a short time before sunrise at Glace Bay. After that the signals gradually come back to normal day strength. It can be noticed that, although the shorter wave gives on the average weaker signals, its maximum and minimum variations

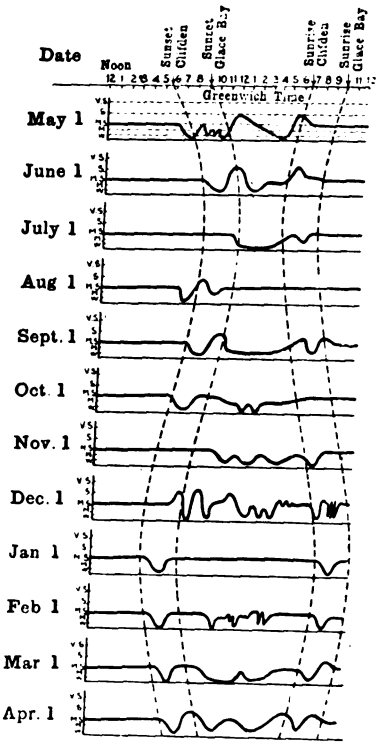

FIG. 5.—VARIATION OF SIGNALS AT CLIFDEN FROM MAY 1910 TO APRIL, 1911. Curve for the first day of each month being shown.

of strength very sensibly exceed that of the longer wave. Fig. 5 shows the curve for the first day of each month for one year from May, 1910, to April, 1911.

I carried out a series of tests over longer distances than had ever been previously attempted in September and October of last year between the stations at Clifden and Glace Bay, and a receiving station placed on the Italian s.s. "Principessa Mafalda," in the course of a voyage from Italy to the Argentine (Fig. 6). During these tests the receiving wire was supported by means of a kite, as was made in my early trans-Atlantic tests of 1901, the height of the kite varying from about 1,000 ft. to 3,000 ft. Signals and messages were obtained without difficulty by day as well as by night up to a distance of 4,000 statute miles from Clifden. Beyond that distance reception could only be carried out during night-time. At Buenos Ayres, over 6,000 miles from Clifden, the night signals from both Clifden and Glace Bay were generally good, but their strength suffered some variations. It is rather remarkable that the radiations from Clifden should have been detected at Buenos Ayres so clearly at night-time and not at all during the day, whilst in Canada the signals coming from Clifden (2,400 miles distant) are no stronger during the night than they are by day.

* "On Methods whereby the Radiation of Electric Waves may be Mainly Confined, &c.," "Proceedings" of the Royal Society, A., Vol. LXXVII., 1906.

Further tests have been carried out recently for the Italian Government between a station situated at Massaua in East Africa and Coltano in Italy. Considerable interest attached to these experiments in view of the fact that the line connecting the two stations passes over exceedingly dry country and across vast stretches of desert, including parts of Abyssinia, the Soudan and the Libyan desert. The distance between the two stations is about 2,600 miles. The wave length of the sending station in Africa was too small to allow of transmission being effected during daytime, but the results obtained during the hours of darkness were exceedingly good, the received signals being quite steady and readable. The improvements introduced at Clifden and Glace Bay have had the result of greatly minimising the interference to which wireless transmission over long distances was particularly exposed in the early days. The signals arriving at Clifden from Canada are as a rule easily read through any ordinary electrical atmospheric disturbance. This strengthening of the received signals has, moreover, made possible the use of recording instruments which not only give a fixed record of the received messages, but are also capable of being operated at a much higher rate of speed than could ever be obtained by means of an operator reading by sound or sight. The record of the signals is obtained by means of photography in the following manner: A sensitive Einthoven string galvanometer is connected to the magnetic

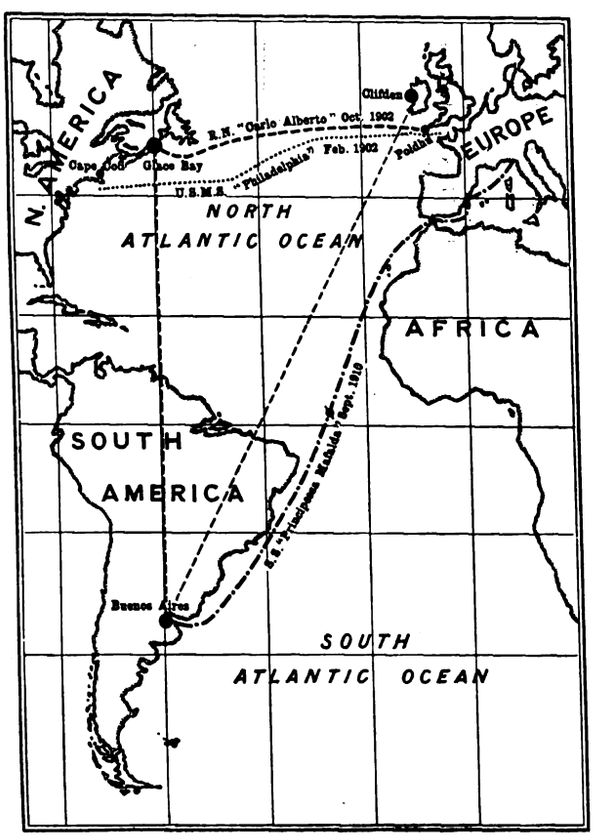

FIG. 6.—CHART OF NORTH AND SOUTH ATLANTIC.

detector or valve receiver, and the deflections of its filament caused by the incoming signals are projected and photographically fixed on a sensitive strip which is moved along at a suitable speed. On some of these records there are characteristic marks and signs produced amongst the signals by natural electric waves or other electrical disturbances of the atmosphere, which, on account of their doubtful origin, have been called "X's."

Although the mathematical theory of electric wave propagation through space was worked out by Clerk Maxwell more than 50 years ago, and notwithstanding all the experimental evidence obtained in laboratories concerning the nature of these waves, yet so far we understand but incompletely the true fundamental principles concerning the manner of propagation of the waves on which wireless telegraph transmission is based. For example, in the early days of wireless telegraphy it was generally believed that the curvature of the earth would constitute an insurmountable obstacle to the transmission of electric waves between widely separated points. For a considerable time not sufficient account was taken of the probable effect of the earth connection, especially in regard to the transmission of oscillations over long distances.

Physicists seemed to consider for a long time that wireless telegraphy was solely dependent on the effects of free Hertzian radiation through space, and it was years before the probable effect of the conductivity of the earth was considered and discussed. The importance or utility of the earth connection has been sometimes questioned, but in my opinion no practical system of wireless telegraphy exists where the instruments are not in some manner connected to earth. By connection to earth I do not necessarily mean an ordinary metallic connection as used for wire telegraphs. The earth wire may have a condenser in series with it, or it may be connected to what is really equivalent, a capacity area placed close to the surface of the ground. It is now perfectly well known that a condenser, if large enough, does not prevent the passage of high-frequency oscillations, and therefore in this case, when a so-called balancing capacity is used, the antenna is for all practical purposes connected to earth. I am also of opinion that there is absolutely no foundation in the statement which has recently been repeated to the effect that an earth connection is detrimental to good tuning, provided of course that the earth is good.

In conclusion, the lecturer remarked that wireless telegraphy was tending to revolutionise our means of communication from place to place on the earth's surface. For example, commercial messages containing a total of 812,200 words were sent and received between Clifden and Glace Bay from May 1, 1910, to the end of April, 1911. Wireless telegraphy has already furnished means of communication between ships and the shore where communication was before practically impossible. The fact that a system of Imperial Wireless Telegraphy is to be discussed by the Imperial Conference now holding its meetings in London shows the supremely important position which radio-telegraphy over long distances has assumed in the short space of one decade. Its importance from a commercial, naval and military point of view has increased very greatly during the last few years as a consequence of the innumerable stations which have been erected or are now in course of construction on various coasts, in inland regions and on board ships in all parts of the world. Notwithstanding this multiplicity of stations and their almost constant operation, mutual interference between properly equipped and efficiently tuned instruments has so far been almost entirely absent, and in regard to the high power trans-Atlantic stations the facility with which interference has been prevented has to some extent exceeded my expectations. The extended use of wireless telegraphy is principally dependent on the ease with which a number of stations can be efficiently worked in the vicinity of each other. Apart from long distance work, the practical value of wireless telegraphy perhaps may be divided into two parts: (1) when used for transmission over sea, (2) when used over land. Its chief benefit, however, lies in the facility which it affords to ships in distress of communicating their plight to neighbouring vessels or coast stations; that it is now considered indispensable for this reason is shown by the fact that several Governments have passed a law making a wireless telegraph installation a compulsory part of the equipment of all passenger boats entering their ports.

EXPERIMENTS ON A MERCURY ARC CONVERTER.

BY J. W. ELLIOTT AND C. S. PARSONS.

Summary.—Photographs are given, obtained stroboscopically, showing the changing over of the arc from one pole to the other in the mercury rectifier. Oscillograph records are also given, from which it is seen that a certain want of symmetry is present. The cause of this is briefly discussed.

The action of a mercury arc converter is based upon the following characteristic of the electric arc—namely, that it is a good conductor in one direction but a non-conductor in the opposite direction. Thus, when it is supplied with alternating pressure, it permits current to flow from the carbon anode to the mercury cathode, whilst entirely cutting off the half-wave which tends to pass in the opposite direction. In order to make both half-waves available for use as a direct current, two anodes are provided, the current entering alternately at each and leaving by the common cathode. For the converter to work continuously an arc must always be present at the cathode, and accordingly the currents in the two anode circuits are caused to overlap each other by means of inductances.

The following tests were recently carried out on a single-phase mercury arc converter manufactured by the Westinghouse Cooper Hewitt Co. (Ltd.). The converter is supplied with alternating current at 200 volts 50 ∽ per second. On the direct-current side the rated output is 4 to 10 amperes at 110 volts. The bulb containing the electrodes is suitably mounted

Digitized by Google

behind a marble panel on the front of which are the terminals and fuses and the starting handle. The transformer and inductances are fixed to the base supporting the panel and the apparatus is enclosed in a sheet-iron casing provided with ventilating holes. The overall height is 22 in., the floor space required being 9 in. by 13 in. The leading dimensions of the glass bulb are: 12 in. overall height and 10½ in. across the horizontal arms, the diameter of the central spherical bulb being 3½ in. The alternating-current supply is connected to an

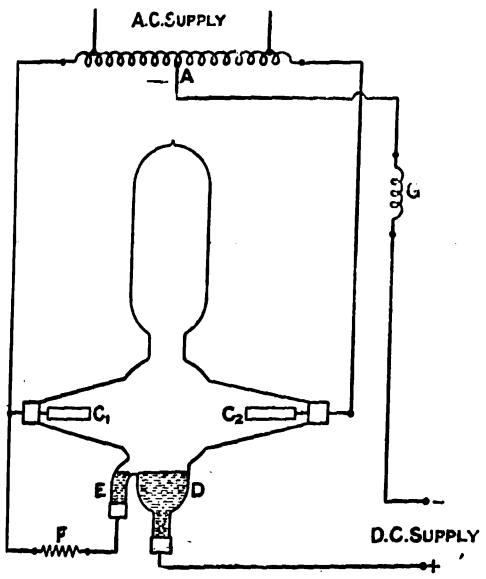

FIG. 1.

auto-transformer, the neutral point of which constitutes the negative terminal of the direct-current supply, as shown at A in Fig. 1.

The glass vessel B, which is exhausted to a high degree, contains the electrodes. The anodes C_1, C_2 are graphite tubes, the cathode consisting of a quantity of mercury contained in the lower part of bulb. The ends of the transformer winding are connected to C_1, C_2. On the production of mercury vapour in

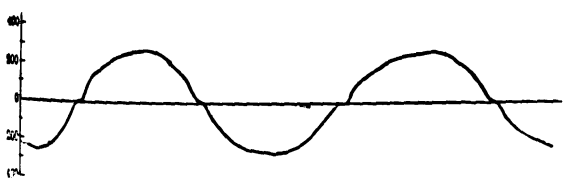

FIG. 2.—WAVE-FORM OF ALTERNATOR SUPPLY VOLTAGE.

the bulb, arcs play alternately from the anodes C_1, C_2 to the mercury pool D. In accordance with the principle stated above an unidirectional current flows from D, which constitutes the positive terminal of the direct-current supply. For the purpose of starting, a supplementary mercury pool E is provided, which is connected to one of the anodes through a resistance, F. The bulb is tilted slightly, thus causing contact to be made for an instant between the mercury in the two pools. An

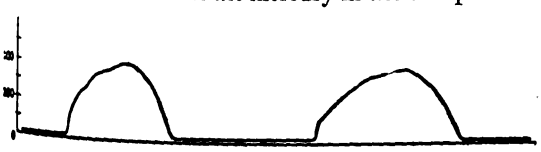

FIG. 3.—P.D. WAVE BETWEEN C_1 OR C_2 AND D.

arc is drawn out, which vaporises sufficient mercury to start the arcs between the main electrodes. The supplementary circuit is automatically cut out when the bulb returns to its normal vertical position. In order to start the converter, it is absolutely essential that the direct-current circuit should be closed. The upper part of the bulb serves to condense the mercury vapour. A choking coil, G, is placed in the direct-current circuit to smooth out the current wave.

The principal object of the tests was to investigate the changes taking place in the state of the arcs during their passage from the anode to the cathode. The interval during which an arc exists between C_1 or C_2 and D is $\frac{1}{100}$ of a second. It will be readily understood that it is impossible to perceive by direct vision any changes occurring in this short time, consequently a stroboscopic method of viewing the arcs during their various stages was adopted. A disc of stiff paper was mounted on the

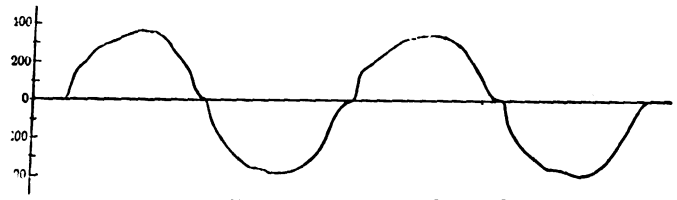

FIG. 4.—P.D. WAVE BETWEEN C_1 AND C_2.

shaft of the six-pole alternator supplying the converter. Three slits were cut in the disc near the edge at equal distances from the centre, and at angles of 120 deg. (*i.e.*, 360 electrical degrees) to one another. The disc was stiffened at its centre by thin metal discs, and screwed to a hub keyed to the alternator shaft. By means of the clamping screws the disc could be moved round with respect to the shaft, and screwed in the new position.

FIG. 5.—DIRECT-CURRENT VOLTAGE OBTAINED DIRECTLY FROM THE CONVERTER.

The angle through which it was moved was read off on a scale marked on the wooden hub. The speed at which the rim of the disc was travelling was 113 miles per hour. The converter was placed in front of the disc in line with the shaft, and viewed through the slits from the opposite side. As viewed through the slits the arcs will only be seen intermittently, the interval

FIG. 6.—WAVE-FORM OF DIRECT-CURRENT SUPPLY VOLTAGE TO EXTERNAL CIRCUIT.

between consecutive views being equal to the interval between successive arcs from the same anode. During the time which elapses between consecutive views, an arc from one anode has disappeared and another from the same anode taken its place. The arcs will, therefore, appear to be at rest, since successive images follow one another with such rapidity. With the eye

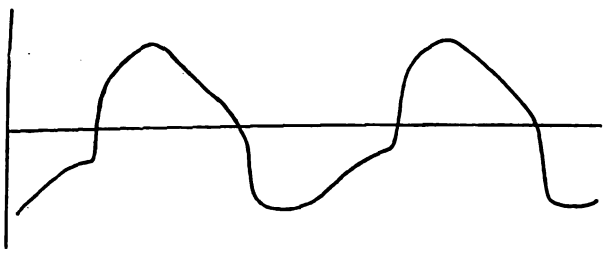

FIG. 7.—ALTERNATING-CURRENT WAVE-FORM SUPPLIED TO THE CONVERTER.

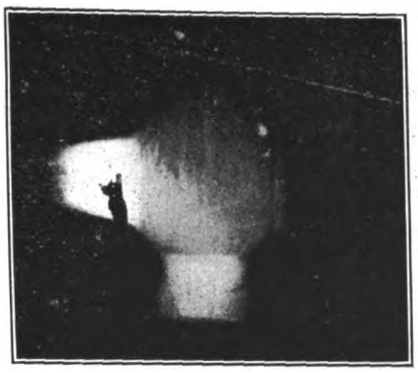
fixed in one position, the arcs as seen intermittently through the slits would appear to be in the same position. The time taken between two consecutive views corresponds to 360 deg. of phase displacement. Consequently as one moves the position of view round the disc—*i.e.*, with respect to the alternator—the state of the arcs at various parts of the cycle will be easily seen. In order to obtain a record of the state of the arcs at certain instants, photographs were taken. A camera was

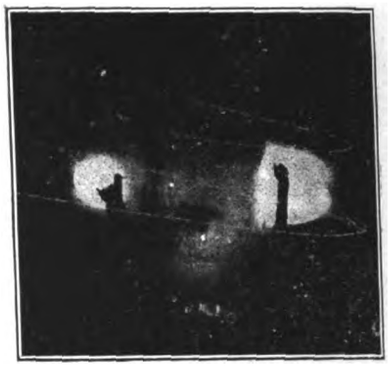
Digitized by Google

suitably arranged behind the disc with its lens in line with the slits, and was kept in a fixed position, the various views being obtained by adjusting the angular position of the disc with reference to the shaft. In this way a series of 20 photographs were taken, of which the series Nos. 1, 4, 5, 10, 11, 13, 17, 18, 19, 20 reproduced are at approximately equal intervals of time. The other series, 2, 3, 4, 5, 6, 7, show the changes taking place at one of the periods of overlap. The actual angle of displacement is indicated in electrical degrees. The constant load on the direct-current side consisted of a number of carbon filament lamps, the total current taken being 9·7 amperes, measured on a moving coil ammeter. Some extra photographs were also taken when the converter was working at half this load.

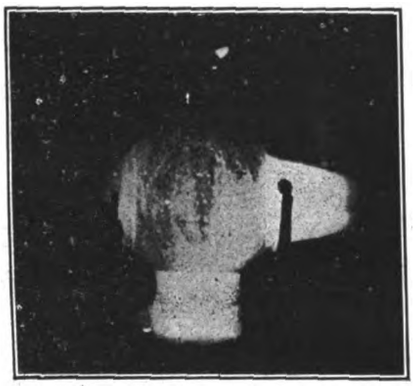


No. 1.—Phase Angle 0°.

No. 4.—Phase Angle 37°·2.



No. 5.—Phase Angle 76°·2.



No. 10.—Phase Angle 114°.

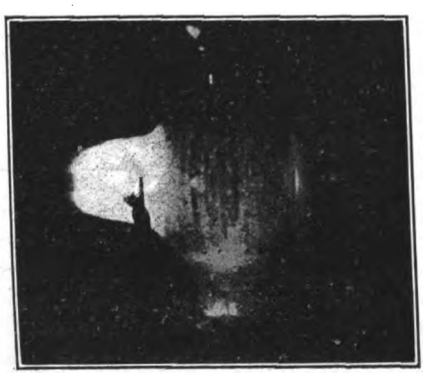
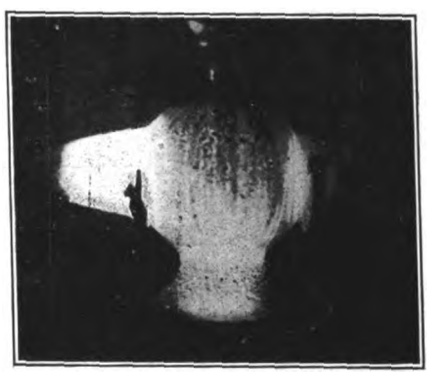
No. 13.—Phase Angle about 192°·5.



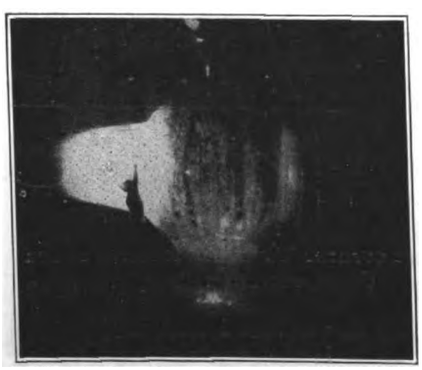
No. 17.—Phase Angle 232°.



No. 18.—Phase Angle 271°·5.

No. 19.—Phase Angle 312°.

First Series, showing Changes at approximately Equal Intervals of Time.



No. 20.—Phase Angle 351°.

No appreciable difference was noticed other than the reduction in the intensity of the light emitted. From the photographic records an examination of the light emitted at the anodes would suggest that the values of the angles of overlap are as follows:—

Overlap in Electrical Degrees.

Greater than 7·5 deg., less than 20 deg.	Probably 11½ deg.
Greater than 62 deg., less than 78 deg.....	Probably 70 deg.

It is thus evident that the two angles of overlap are widely different at the two points in each complete cycle at which the arcs change over. The probable explanation of this will be dealt with later.

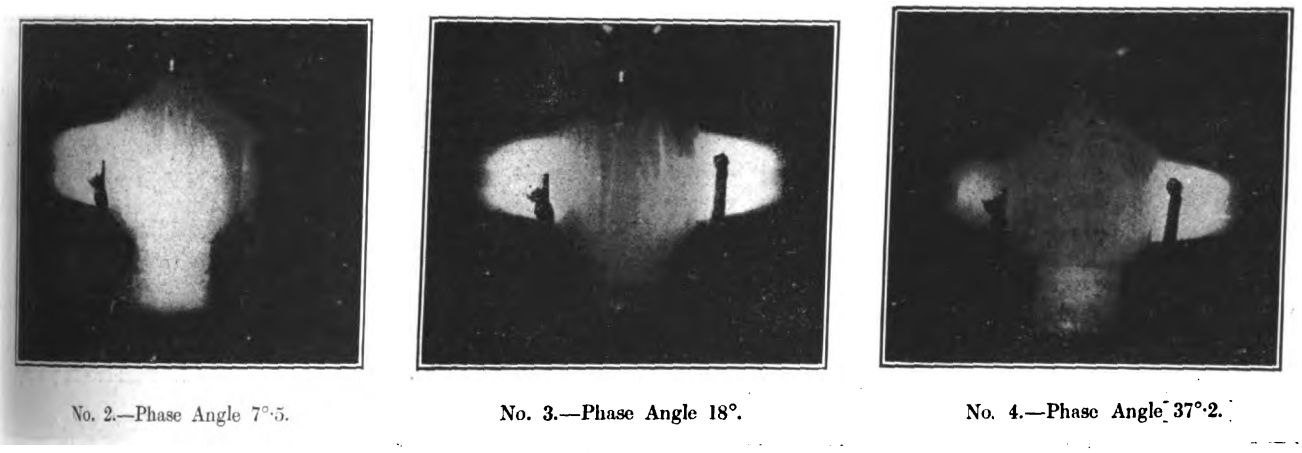
Some oscillographs were also taken of the wave forms of current and voltage between certain points in the converter for the purpose of making its action clearer, and to see the degree of variation of the direct current and voltage obtained. The oscillograph used was a Duddell high-frequency type. Voltage waves were the most interesting, and some of these are repro-

Digitized by Google

duced. Fig. 2 is the voltage wave of the alternator on this load, and was taken as a standard of reference for the other waves. Fig. 3 shows the form of the impressed voltage between C_1, C_2 and D, the waves obtained from both anodes being exactly similar. It will be noticed that there is a horizontal portion of the wave which indicates the period during which the arc is burning, and consequently there is only a P.D. of about 15 volts between the two points. When the arc is not burning the P.D. rises to the full value as indicated in the wave shown.

Fig. 4 shows the P.D. wave between C_1, C_2. The small horizontal portions here show the period during which the two arcs are burning simultaneously. In order to see the fluctuation in the direct-current voltage obtained directly from the converter, Fig. 5 was taken. This shows itself as merely the superposition of the waves between C_1 and D and between C_2 and D. The variation of the voltage is here very great, being from 15 to 200 volts, or about 92 per cent. of the maximum.

taken, and is shown in Fig. 7. This is particularly interesting on account of the fact that the wave is not symmetrical in the way in which alternating-current waves generally are. It possesses symmetry in that succeeding pulsations in either direction are similar, but the half periods represented below the line are dissimilar to those above. This suggests that the distortion is not equal in each of the anode circuits, and this difference is confirmed in the photographs by the different angles of overlap. The probable reason for this is that there is more inductance in one anode circuit than the other, the result being that the currents have relative positions as indicated diagrammatically in Fig. 8. An examination of the resultant current in the secondary portion of the transformer winding gives a wave-form as shown in Fig. 9. It is thus obvious that distortion similar to this would be produced in the supply current from the alternator. The difference in the inductances in the two anode circuits may be due to a difference in the windings, but is very



No. 2.—Phase Angle 7°·5. No. 3.—Phase Angle 18°. No. 4.—Phase Angle 37°·2.

SECOND SERIES, SHOWING CHANGES DURING PERIOD OF OVERLAP.

Fig. 6 is the direct-current voltage wave as supplied to the external circuit—*i.e.*, after passing through the inductance coil G. The effect of this is very marked, the wave being smoothed out into a very regular form, the variation of voltage being reduced to 80 to 170, or only 53 per cent. of the maximum. This variation is not noticeable in glow lamps when working at

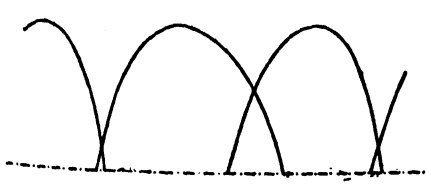

FIG. 8.

the normal frequency of 50 ∼. but if worked at a much lower frequency a very decided flicker is observed. Oscillographs of the current flowing to each anode were taken, and were exactly similar.

The direct-current wave is exactly similar to the voltage wave. The wave-form of the current from the alternator was likely due to the position of the shell-type inductance coil in the direct-current circuit, which is placed near one end of the auto-transformer, probably in close proximity to the inductance in one of the anode circuits which is wound on the end of the transformer coil. It was also noted that one of the arcs was

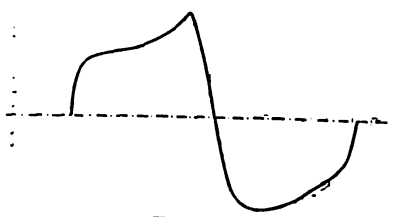

FIG. 9.

deflected from its central position to the back of the mercury pool, whereas the other arc played in the centre of the pool.

A comparison of the angles of overlap indicated by the voltage waves obtained by the oscillograph are not so widely different as those shown by the photographs. The only explanation which the authors can suggest is that the arc may

Digitized by Google

continue to give out light after the current in it has completely disappeared.

Efficiency and regulation curves were also obtained and proved to be the same as specified by the makers. The method used for the test was the differential wattmeter method. The curves obtained are shown in Fig. 10. As will be seen, the efficiency is practically constant at all loads. The average efficiency in this case is about 84 per cent. It was impossible to find the form of efficiency curve at very low loads on account of the fact that the arcs will not burn when the load falls below about 3 amperes.

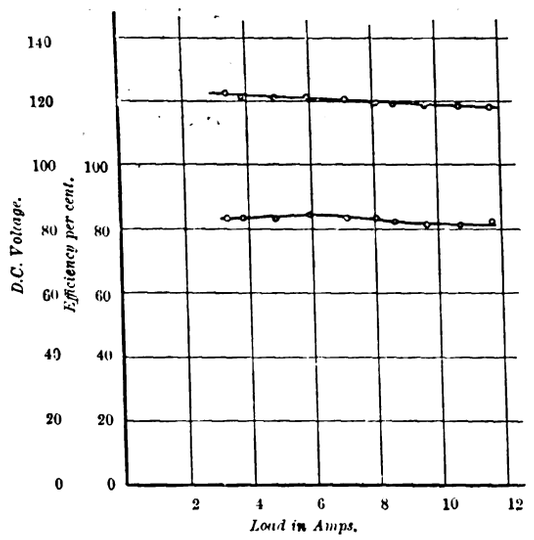

FIG. 10.—EFFICIENCY AND REGULATION CURVES.

It was, however, found that the converter would work on a lower load than it was possible to start with if the bulb was well warmed up and the load carefully reduced from the starting value.

In conclusion, our thanks are due to Prof. J. T. Morris for valuable assistance and suggestions, and to the staff of the Electrical Engineering Department of East London College, where the above work was carried out.

DEFINITIONS OF PHOTOMETRIC MAGNITUDES AND UNITS.

The following definitions were embodied in the 1910 report of a Sub-Committee on Photometric Units of the Committee on Nomenclature and Standards of the Illuminating Engineering Society of New York. This report was submitted at the Baltimore Convention, and is reproduced from the "Transactions" of the Society. The Sub-Committee consisted of Messrs. A. Blondel, A. E. Kennelly, E. L. Nichols, E. B. Rosa and C. H. Sharp.

Light (flux) is the stimulus produced by radiation which excites vision. It is proportional to the rate of flow of radiant energy and to a stimulus coefficient which depends chiefly on the spectral distribution of that energy.

The presence of a flux of light is recognised by the *illumination* which it produces. The illumination is proportional to the flux per unit area of the illuminated surface or to the flux density incident on that surface.

The *luminous intensity* of a point source of light is measured by the luminous flux per unit solid angle in the direction in which the intensity is taken. Two point sources of light are said to be equal in intensity when they produce equal illuminations at equal distances. Due to the fact that standardised point sources of light of unvarying intensity are obtainable, while it is not practicable to obtain a standardised luminous flux or a standardised illumination without a standardised source of light, the unit of luminous intensity has become the fundamental photometric unit from which the values of the unit of flux, of illumination, &c., are derived; that is, the unit of intensity is the fundamental photometric unit, although flux is the fundamental photometric magnitude.

The unit of luminous intensity is the *candle*. By candle is meant the common candle of Great Britain, France and America, for which the name "International Candle" has been proposed.

The term "candle-power" is used as the equivalent of the term "luminous intensity in candles."

The unit of luminous flux is the flux of light produced in a unit solid angle (one steradian) by a uniform source of one candle placed at the apex of the angle. This unit is called the *lumen*.

The unit of illumination is the illumination which is produced by a flux of one lumen falling on a unit plane area. This is equivalent to the illumination produced by a source of one candle at unit distance.

The unit of illumination in the c.g.s. system is the lumen per square centimetre. As a practical unit the milli-lumen per square centimetre is recommended.

In English-speaking countries the unit of illumination commonly employed is the "foot-candle" (lumen per square foot). This designation is preferable to "candle-foot." The corresponding metric unit "metre-candle" (lumen per square metre) is called the *lux* (plural lux). It is desirable that all values of illumination should be expressed in terms of lumens per unit area, the unit of area being chosen in accordance with the requirements of the situation.

By the *specific intensity* of a luminous surface or body is meant its apparent luminous intensity per unit area, expressed in candles per square centimetre of apparent area, or area projected on a plane perpendicular to the direction in which the measurement is made and including only a surface of small dimensions in comparison with the distance at which the measurement is made.

By the *specific radiation* of a luminous surface or body is meant its total luminous flux per unit area expressed in lumens per square centimetre or milli-lumens per square centimetre.

By *mean spherical intensity* of a source of light is meant the average value of its intensity as taken in all directions in space. It is equal to its total luminous flux in lumens divided by 4π.

By *spherical reduction factor* of a source of light is meant the ratio of its mean spherical intensity to its mean horizontal intensity.

The names of these units in the c.g.s. system and their mathematical relations to each other are shown in the accompanying table:

Photometric magnitudes.		Name of unit.	Equation of definition.
1. Intensity of light or strength of luminous source.		(International) candle	$I=\frac{dF}{d\omega}$; $I_s=fI$.
2. Luminous flux.		Lumen	$F=4\pi I_s$; $F=I\omega$.
3. Illumination	Specific flux or flux density.	Lumens/cm² or Millilumens/cm²	$E=\frac{F_i}{S}=\frac{I}{r^2}$
4. Specific radiation	Specific flux or flux density.	Lumens/cm²	$R=\frac{F_s}{S}=mE$
5. Specific intensity	Brightness.	Candles/cm²	$i=\frac{I}{S^*\cos e}$
6. ——		Lumen-hours or lumen-seconds	$Q=FT$

International candle abbreviated to C.
International lumen abbreviated to L.
Hefner unit abbreviated to HK, as now used in Germany.
f is the spherical reduction factor of a light source.
ω is a solid angle $=\frac{\text{area on a sphere subtending the angle.}}{\text{square of radius.}}$

r is distance from light source in centimetres.
m is coefficient of reflection or radiation ($1-m$ = absorption).
S is an area in square centimetres.
e is angle of emission.
i is an angle of incidence.

* S refers to surface seen from the point at which I is taken.

THE DUNSTON POWER STATION OF THE NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO.

(*Concluded from page 500.*)

Switchgear.

The switchgear arrangements at Dunston are perhaps the most interesting part of the station, showing, as they do, a distinct advance upon previous practice. Instead of the usual elaborate switchboard which forms a striking feature of most power-house engine rooms, the Dunston engine room, as mentioned above, contains practically no high-tension switchgear or electrical instruments at all. With the exception of certain unobtrusive high-tension panels of the "iron-clad" type, which control the "unit" transformers that supply the auxiliaries belonging to each generating unit, and an indicating wall ammeter for each generator, the high-tension gear and instruments are installed in a separate switch-house 150 yds. away from the engine room, where are also placed both the main switches themselves and the operator and board operating them.

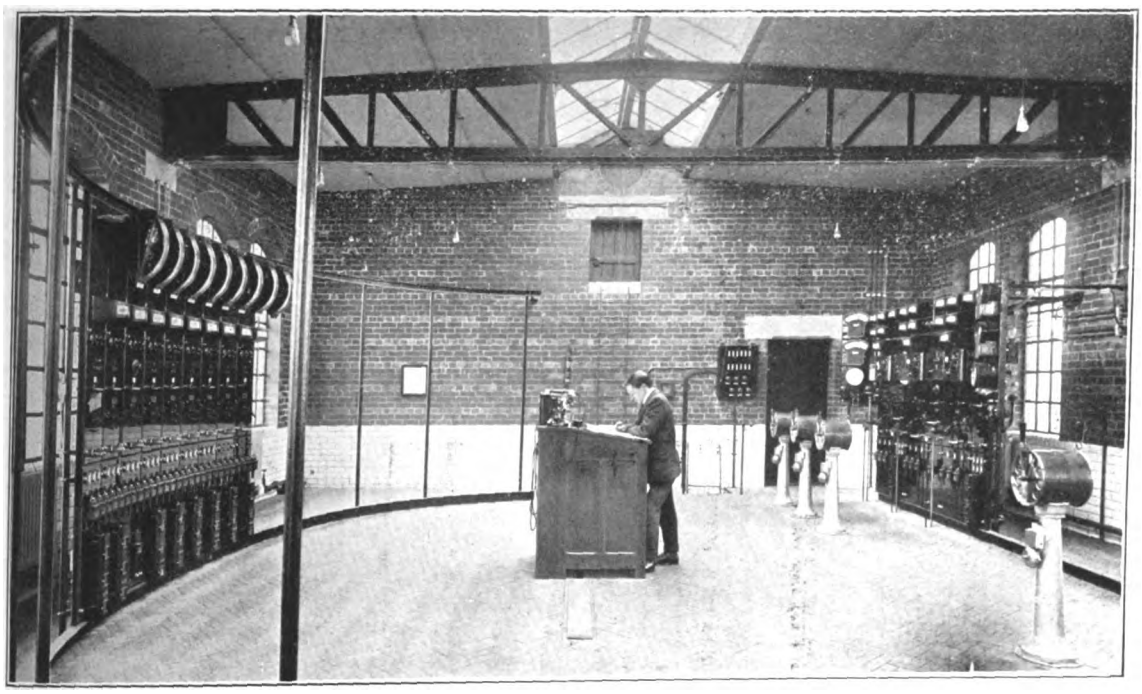

Fig. 11.—View of Switch Control Room.

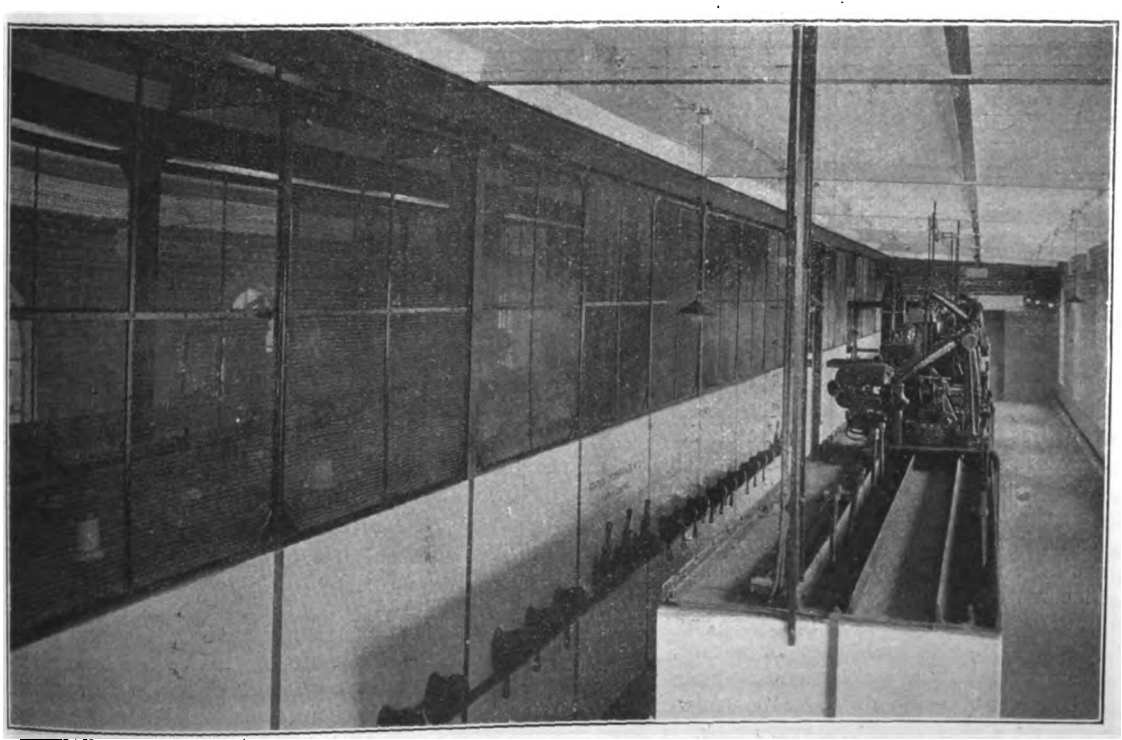

Fig. 12.—Switch-Room, showing 'Bus Bars and Operating Gear.

There is, however, in the engine room near each generator, a set of emergency gear for tripping the main high-tension generator switches in the switch-house, with which is inter-

Digitized by Google

locked a field switch; there is also a large dial indicating ammeter to show the approximate load on each alternator. Apart from these and the direct-current gear for the motor generators, there are practically no electrical connections or cables visible at all the ducts, &c., for the whole of the wiring having been provided for in advance they are therefore properly hidden.

The general electrical conditions of the Newcastle-upon-Tyne Electric Supply Co.'s system are as follows:—Electrical energy is generated at 5,750 volts on the three-phase system and is fed into the network where it is transformed up to 11,500 or 20,000 volts, or down to 2,875, 600 or 440 volts; Dunston station has to run in parallel with various other stations.

The switchgear may be conveniently considered under the following heads:—The control board (Fig. 11) in the switch house for operating the high-tension switchgear in the switch house and the engine room; the main high-tension switchgear in the switch house which controls the generators, pole, oil break, neutral isolating switches and resistances, three sets of emergency tripping gear (breaking the exciter fields in the control room), three wall dial current indicators, while in the control room are the necessary boards and switches for operating all the high-tension gear.

The low-tension 440-volt three-phase gear consists of two transformer panels, two lighting motor generator panels, one traction rotary converter panel and three feeder panels for supplying three "unit" distribution boards.

The principal direct-current gear consists of one 500-volt traction board, one 100-volt power and lighting board, one main lighting distribution fuse-board, ten local distribution boards, one lighting battery panel (in the lighting battery room) and two control battery fuse panels (in the control battery room).

The switch house is a brick building with concrete roof, 89 ft. 3 in. long, 29 ft. 6 in. broad and 22 ft. 8 in. high. It has two floors and is divided into two divisions. The front of the building contains on the ground floor the offices, lavatories, &c., for the

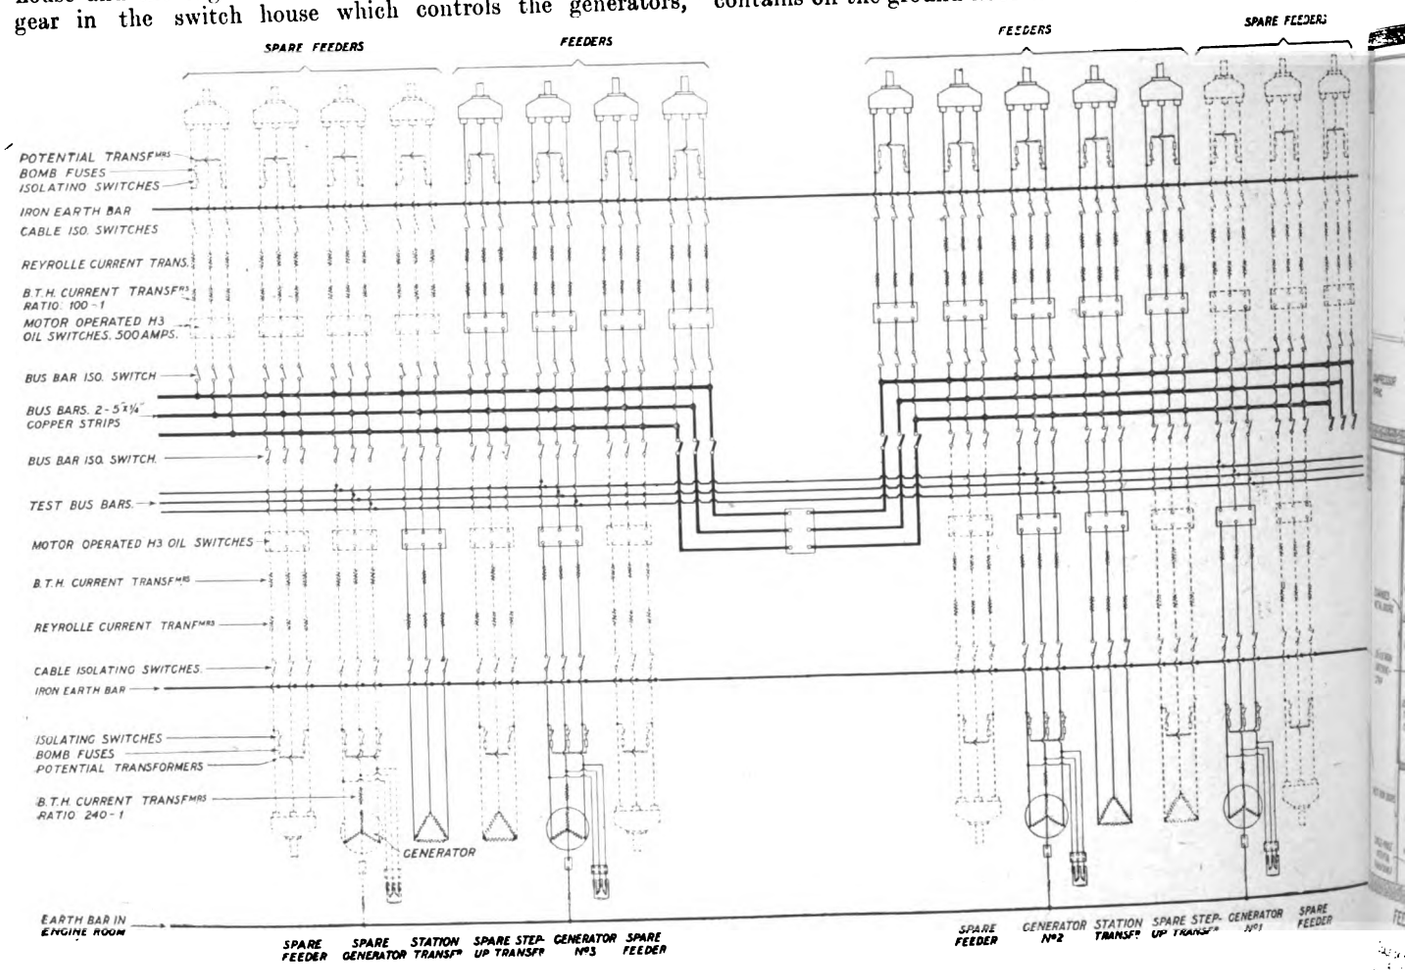

FIG. 13.—DIAGRAM OF E.H.T. MAIN CONNECTIONS.

feeders, main 'bus bars (Fig. 12), and the station power and lighting transformers; the high-tension switchgear in the engine room for controlling the "unit" transformers in the engine room, the low-tension three-phase gear in the engine room controlling the auxiliaries; the direct-current switchgear for exciting, the lighting and battery charging arrangement and locomotive driving.

The following is the principal high-tension (6,000 volts) gear at present installed:—In the switch house three complete 1,200-ampere generator panels and one skeleton panel, eight complete 6,000-volt 500-ampere feeder panels with protective gear, one feeder panel without protective gear, 11 500-ampere skeleton feeder equipments, two 1,200-ampere skeleton feeder equipments, two 500-ampere power and lighting transformer panels, one complete and one skeleton 2,000-ampere 'bus-bar section panel. In the engine room there are three 100-ampere ironclad panels for unit transformer, three 500-ampere single-

control room engineer. The control room itself contains the operating boards and is on the first floor. The back part of the building, which is shut off by iron doors from the remainder, is devoted to the switchgear itself, the main oil-break switches and 'bus bars being on the upper floor, the isolating switches, current and potential transformers, &c., being in brickwork cells on the lower floor. The bare connections between the switches and 'bus bars are on the underside of the roof of the lower room, but are in full view and accessible from the lower room by means of ladders. On the other hand, they are absolutely out of reach of accidental contact.

The control room (Fig. 11) is a well lighted apartment, 40 ft. by 29 ft. 6 in. with partial glass roof. It is mainly occupied by the semi-circular operating switchboards by which the feeders are controlled and by the smaller boards for generators. The operating board of black slate is divided into sections, the generator and transformer panels and 'bus-bar switches being

Digitized by Google

placed separately from those controlling the feeders. With a view to simplicity and safety the connections to the various operating panels are arranged so that it will be possible at any time to change the position of any individual operating panel to any other position on the semi-circular range of the board. The control gear is operated by means of direct current at a pressure of 100 volts, which is from a small battery specially told off for the purpose. The general arrangement of the extra-high-tension connections is shown in Fig. 13.

There are three generator panels and one "skeleton" equipment. Each 6,000-volt generating panel on the control board contains the following instruments: One main ammeter and voltmeter, one power-factor indicator, one indicating wattmeter, one field ammeter, one integrating wattmeter for measuring on unbalanced loads. There are also one operating switch for the main oil-break switch, two pilot lamps for indicating the operation of this switch, as well as a synchronising and voltmeter plug, three-pole overload protective devices, chop-over type and is arranged to make or break the main oil-break switch immediately contact is made. Its position is indicated by the lighting of a red or blue lamp and when the circuit is broken the operation is automatically indicated by the position of a small coloured pin in the switch panel.

Switch Room.—As already mentioned, the switch room itself is a two-storey building. Access to the upper storey or switch gallery is obtained through an iron fireproof door leading from the control room; access to the lower storey is from the passage way under the control room. The 'bus bars and main oil break switches are in the switch gallery and the isolating switches, 'bus-bars connections, current and potential transformers, &c., on the lower storey, as will be noticed in Fig. 14.

The switch gallery is arranged as follows:—Three moulded stone tables run parallel to each other down the length of the gallery being continuous except for a space some 6 ft. or 7 ft. wide in the middle. The main 6,000-volt 'bus bars are placed on insulators on the central table which is 5 ft. 5 in. high and is

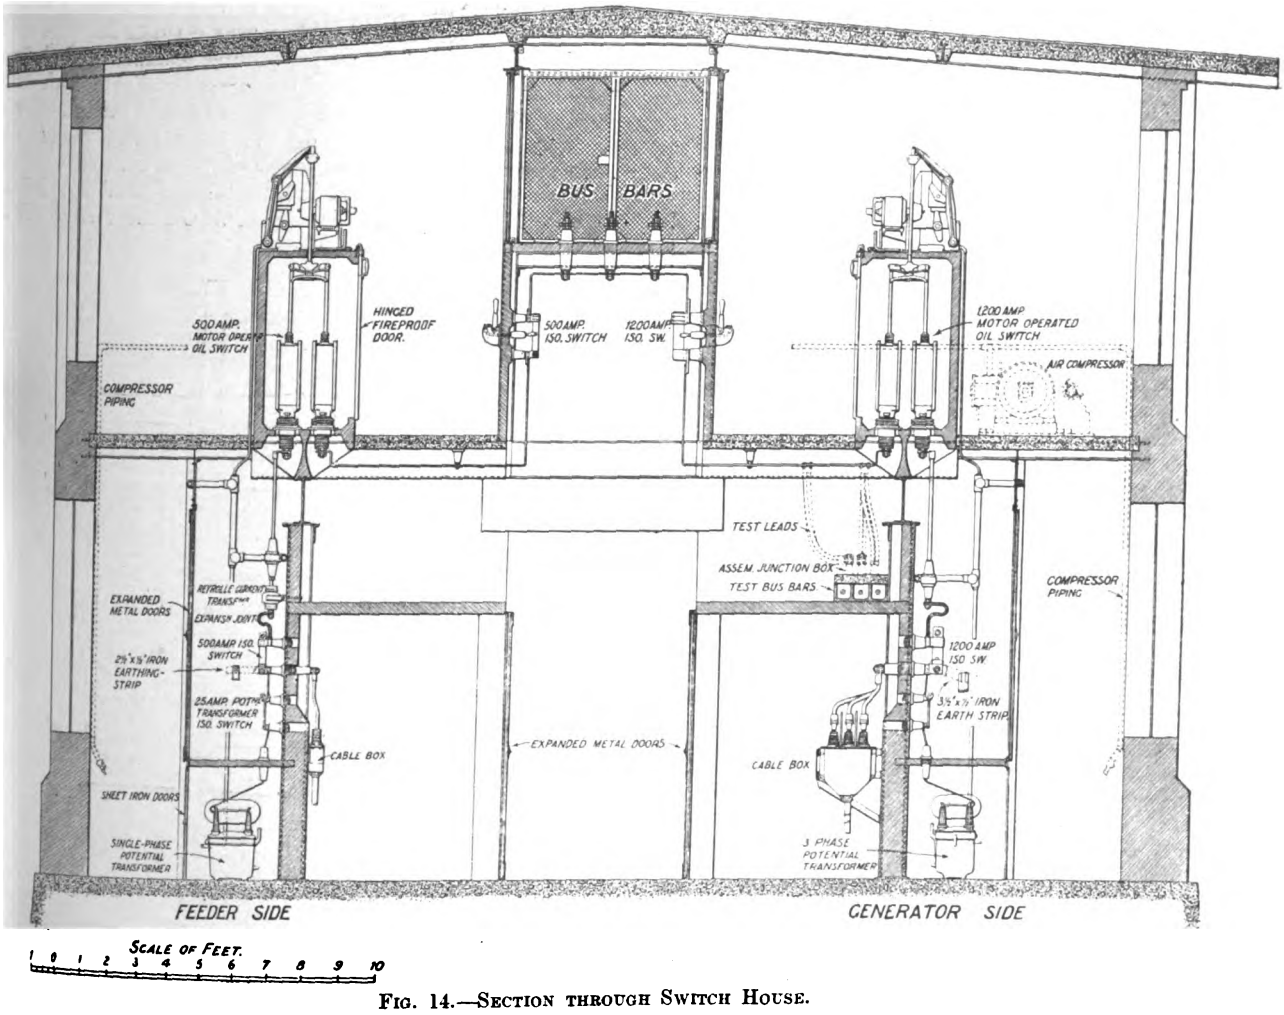

FIG. 14.—SECTION THROUGH SWITCH HOUSE.

three time limit fuses, one governor switch and one rheostat hand-wheel. In front of each generator panel stands a telegraph which communicates with a corresponding instrument in the engine room. At each end of the generator board is a synchronising panel with two voltmeters, two lamps and a rotary synchroscope.

In the same way, as described above for the generators, each feeder has an operating panel on the feeder control board. This panel contains an edgewise ammeter, a voltmeter, an operating switch for the main oil-break switch, two pilot lamps, red and blue, for indicating the position of the control switch, synchronising and voltmeter plugs, three time-limit fuses and three-pole Reyrolle protective relays.

Eight of the feeders are fitted with the Merz-Price balanced protective gear with time-limit relays, in parallel with the three fuses mentioned above. The control switch is of the protected by expanded metal screens throughout the whole of its length. They also run up to the ceiling, thus forming a cage in which the 'bus bars are visible for their whole length but are quite inaccessible unless the metal screens be removed. The bolts supporting the 'bus bars on the insulators also form the connections to the main switches. They pass through the top of the table which forms part of the ceiling of the chamber underneath. Along this ceiling are run the bare copper connections to the under sides of the switch tables. Along the sides of the central 'bus-bar tables are arranged the handles of the isolating switches, these, however, being only accessible from the chamber underneath. The 'bus bars, which consist of strips of copper 2½ sq. in. in section, and the tables and cage containing them are divided in the middle of the room by a main oil-break switch which is capable of opening on a load of 30,000 kw. This switch is illustrated in Figs. 15 and 17 here-

Digitized by Google

with, and its operating gear in Fig. 16. The connections from the two sections of the 'bus bars to this switch are taken down through isolating switches under the floor along the ceiling of the chamber underneath and then up to the switch. The three isolating switches for each circuit are capable of being locked in the "off" position.

The other two tables also run the length of the room on each side of and parallel to the 'bus-bar table, and are also ivided in the middle, making, in fact, really four tables in all. Each of

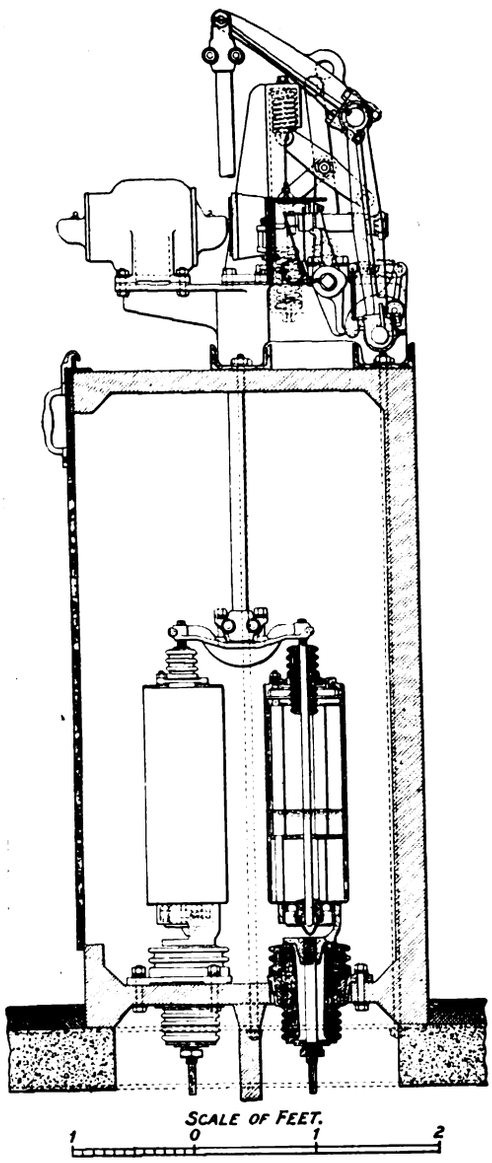

FIG. 15.—GENERAL ARRANGEMENT OF 30,000 KW. 6,000-VOLT 'BUS-BAR SECTIONISING SWITCH.

these tables is divided into eight cells, and each cell is divided into three compartments that contain the three portions of the oil-break switches. The motors and operating gear for each oil-break switch are placed on the top of the cell, and are left unprotected, since no part is alive. The fronts of the cells are protected by "uacolite" doors which are hinged so as to allow the escape of any hot air in case of explosion. From the lower part of each oil-break switch a connection passes through an insulator to the ceiling of the floor below, across which it is carried to the isolating switches and 'bus bars already described. The two tables on the left-hand side of the room are entirely devoted to feeders, while those on the right side of the room contain five skeleton feeder panels, one skeleton generator panel, three generator panels and two transformer panels, all of the same size. Each main high-tension switch panel is of the same size and is arranged so that it is exactly opposite its own portion of the 'bus-bar and its own 'bus-bar isolating switch, an arrangement which reduces the risk of a mistake to a minimum. For each generator, feeder and transformer there are three identical 'bus-bar isolating switches and a three-pole motor-operated main oil-break switch in the switch gallery. Nine complete feeder panels are already installed, and provision is made on the 'bus bars for 11 further feeders, each of 500-amperes capacity, and for two feeders each of 1,200-amperes capacity. The switches already installed with the exception of the 'bus-bar dividing switch, are identical in size and design. The whole of the chamber is painted white and is lighted by side windows, the roof being solid concrete. There is ample space to pass round all the switches, and the room is well illuminated. It is, moreover, perfectly safe from accidental contact with any current-carrying parts.

On the ground floor there are three passage ways corresponding to the three tables in the upper room. The central passage has on each side brick-work cells corresponding in number and position to the different high-tension switches exactly below which they are placed.

The various three-core feeder and generator cables enter from outside the switch house and are brought up through the floor of these cells to a three-way dividing box from which the three single cables are led to three separate terminals fixed on insulators on the vertical brick-work wall at the back of the cell. These terminals and insulators extend through this wall to the isolating switches on the other side. The two side galleries also contain a series of brick-work cells, the top portion of which is closed in by expanded metal doors and the lower portion by sheet-iron doors. On the vertical wall at

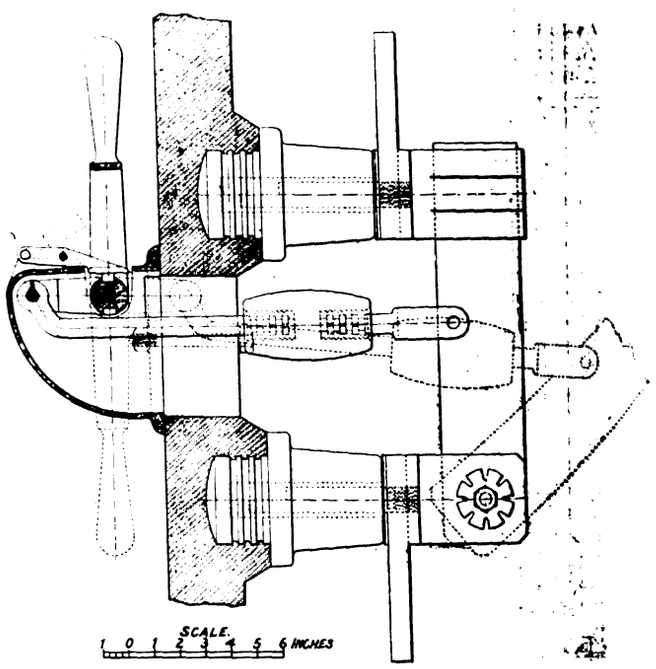

FIG. 16.—OPERATING GEAR OF ISOLATING SWITCH.

the back of these cells are fixed the three single-pole isolating switches already referred to, the lower terminals of which extend through the wall to the cables. The upper terminal is connected by an expansion joint to a vertical copper rod carried straight up to the lower terminal of the oil-break switch through a current transformer for operating the protective gear and another current transformer for the ammeters. From the lower side of the isolating switch connections is taken a smaller isolating switch to the potential transformer which itself is situated in the lower part of the cell under a brick-work cover but accessible from the front by the removal of the sheet iron door. The current, after passing through the outer terminal of the oil-break switch descends by the inner terminal through a moulded stone-work division between the two terminals and is carried by bare conductors across the roof to the central part of the chamber, where it is bent upwards and passed vertically through its own 'bus-bar isolating switch to the lower side of its own 'bus-bar terminal.

Digitized by Google

These arrangements are specially interesting as representing the latest designs for the protection from breakdown of switchgear and high-tension circuits. Solid earthing connections are carried throughout the upper and lower chambers to the metal work and cases of all switches, transformers, &c. A set of special test 'bus bars, which are laid in solid, are run the whole length of the lower chamber and out to the test pond; and arrangements have been made for temporarily connecting these leads to the various generators. Broadly speaking, all the panels are of the same kind, the feeders, generators, power and lighting transformers all having their main oil-break switches and single-pole isolating switches between the 'bus bars, and between the cables and their corresponding panels on the control board in the control room. The isolating switches, it will be noted (*see* Fig. 16), are designed to ensure that they shall not be thrown out by the magnetic forces exerted by heavy currents. The 'bus-bar isolating switches are operated as already stated by fixed and link-work handles from the upper gallery, while the lower isolating switches can be operated when required by long wooden handles. The main oil-break switches have their main contacts outside the oil as well as a renewable breaking contact under the oil. They are arranged so that the motors wind up a spring for each make or break, and they are therefore tripped immediately the control circuit is made. The switch can be locked when open. The potential transformers on the generators are of the three-phase type, while those on the feeders are single-phase. All the high-tension panels with the exception of the transformer panels are provided with the Merz-Price system of balanced protective gear.

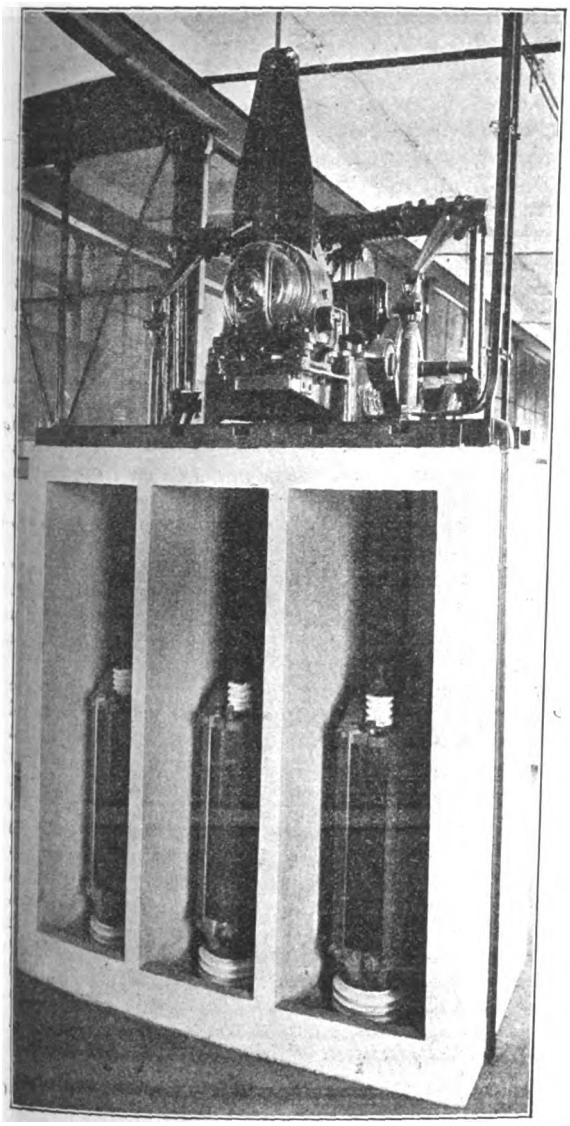

Fig. 17.—30,000 kw. 'Bus-Bar Sectionising Switch.

In the engine room, as mentioned above, there is, in addition to the switchgear already described, a 500-ampere neutral isolating switch and resistance equipment for each generator; and a set of emergency tripping gear for operating the main oil-break switch in the switch house in case of serious emergency. Interlocked with this there is also an extra field switch. On the wall of the engine room there is an indicating ammeter opposite to each generator. Each generator also has its own unit transforming set in the transformer annexe in the engine room. The leads for this transformer do not pass through the switch house but are taken direct from the generator terminals through ironclad switchgear of the Reyrolle type in chambers on the northern side of the engine room to the transformers.

Conclusion.

The above description shows sufficiently, we consider, that while no more money has been spent on architectural features than is absolutely necessary, every care has been taken with the engineering work at Dunston station to ensure that it shall carry out satisfactorily the work it has been designed to do. The design of the switchgear is a distinct advance on usual practice, as it will enable the operator to pay full attention to the work he has in hand, undisturbed by anything that may be going on in the engine room. We have to thank Messrs. Merz and McLellan, the consulting engineers, and the officers of the Newcastle-upon-Tyne Electric Supply Co., for giving us the opportunity of describing this interesting plant.

At the formal opening of the Dunston power station on Wednesday last week, visitors were given an opportunity also of inspecting the Carville power station of the Company. Subsequently the party proceeded to Tilley's Rooms, Newcastle, where luncheon had been provided, Dr. J. T. Merz presiding.

After the royal toast had been duly honoured, the chairman introduced Mr. S. Z. de Ferranti, who, he said, had devoted his life more than anyone else to the problems connected with power transmission.

Mr. Ferranti, in proposing the toast of "Electric Power Supply," remarked that in looking over the district of the Tyne and finding hardly a single smoky industrial chimney, they had seen the signs of what he believed was the greatest industrial development that had taken place in any country since the introduction of factories. The Newcastle Electric Supply Co.'s undertaking was a model to the rest of the country of the way in which they should proceed in their industrial and commercial development. Electricity was the greatest labour saver; the net result should be a higher standard of living and more spare time for the worker.

The Chairman acknowledged the toast and then proposed "The Mining Industry," coupling with it the name of Mr. A. Pease, J.P., who, in reply, said that the one redeeming feature in the mining industry was the prospect of getting cheaper electricity.

CONFERENCE ON EDUCATION AND TRAINING OF ENGINEERS, 1911.

SECTION III (Practical Training).

The following Paper by Mr. W. H. Allen was also read:—

THE REQUIREMENTS OF PRACTICAL TRAINING IN WORKS, WITH THE NECESSARY COMPLEMENT OF SCIENTIFIC STUDY.*

BY W. H. ALLEN.

During recent years we have seen a great change in ideas as to the value of engineering apprenticeship. The obvious cause of this change is the now generally-recognised principle that the period of apprenticeship must be combined with a period of college training, either before or after apprenticeship. The original idea of a seven

* Abstract.

Digitized by Google

years' apprenticeship in a workshop only lapsed in the 'sixties. Since that time a period of five years has been considered as usually desirable, but now that it has become necessary for a young man to devote a considerable period, in addition to his apprenticeship, to scientific study at college or the university, it has been found necessary to curtail the period of works' apprenticeship.

I think it is now fairly certain that no man can expect in future to take a good position in life as an engineer without having equipped himself for his work by taking advantage of the best that our age can offer in the way of scientific training and opportunities for scientific study, as well as by a period of apprenticeship in practical engineering under commercial conditions. If he has not done so he will find it exceedingly difficult to compete with the man who has thus availed himself, and who has gained a clearer insight into those principles which form part of his work, and also developed those faculties of clear thinking and accurate reasoning which are so invaluable to an engineer.

In spite of this very important development one must not disparage the value of the workshop apprenticeship, as it is so often the lot of the engineer to have to deal with quantities of which we have, as yet, very little accurate knowledge. Problems of this nature are of almost daily occurrence in practical work; hence experience of them at the present state of knowledge must be gained by personal contact with them. In this connection it should be remarked that much of the value of scientific training and study for the engineer is more of an indirect nature than the mere acquisition of certain mental tools and equipment, and consists very largely in the value of such studies as a means to mental development, so as to enable the engineer to face any difficulty with an open mind, whose power of insight has been sharpened, and which has been trained in methods of accurate reasoning and logical deduction.

One is often asked, in the case of a student determining to go both to college and to works, which he should enter first. My views on this point are that a schoolboy coming direct to the works does not succeed so well or stand the same chance as the one who has been to college first. The latter has been better broken in, as it were. He has been formed in character by association with others of the same age in like pursuits, has learnt the value of time, and to recognise the serious side of life, and those qualities which tend to manliness, and has also received training in mental development. Much economy in time is also effected by preserving the continuity of study. I should, therefore, say that the man who sets himself the task of obtaining his degree before entering the works stands a much better chance of securing a higher and more responsible position in life than the one who is trained in the reverse order. The former not only takes a greater and more complete interest in the works and workshop life, but makes the most of his time, and grasps ideas and their principles much more readily than the man who comes to the works with merely a public school training.

Another question frequently asked is, "How much study should a pupil undertake during the period of his practical training?" In my opinion, if a young man conscientiously does his duty from 6 o'clock in the morning until 6 in the evening, he will find that as much as his health can stand, without burdening it by further serious study at night. At the same time, unless some attention is paid to the work which has been done at college, this part of his studies is apt to lose its freshness and interest for him, his attention being concentrated purely on his daily task to the exclusion of everything else. My custom has been not to make this a compulsory part of the training, but to give lectures weekly explanatory of the actual work being carried on in the shops, thus greatly increasing interest in and adding to the knowledge of the work being done.

It must be remembered that the workshop to-day, involving as it does so many different classes of measurement, the use of instruments, and more elaborate styles of drawing—all necessitating a much higher educational standard throughout the works—requires a man of more thoughtful age and education to enter fully into his workshop apprenticeship than was formerly the case. A college training, moreover, must inculcate that habit of accuracy of thought which cannot be obtained in any other way.

As regards the requirements of workshop training, there seems little doubt that a period of three years—the actual time depending on the previous education of the subject—comprising a year in the drawing office, should be spent in the works in a not too specialised manner—that is to say, it should cover work in some or all of the branches of mechanical and electrical practice, which may be found in some of our better establishments. So long as this part of an engineer's training has to be carried out under commercial conditions, so long will it be more or less dependent on the state of trade and other local conditions. This is not altogether a disadvantage, for the alternating periods of exceptional activity in trade, and the reverse, will carry their own important lessons to the observant student.

It will always be difficult, if not impossible, to lay down a plan either for scientific study or works' apprenticeship which will suit all, and each individual case will require consideration on its merits: at any rate, whatever plan is arrived at will have to be very elastic as regards the arrangement of details. I think we are inclined at present to attach rather too much importance to the direct value of scientific study as being the means of providing the student with certain mental tools for use in after life, and too little to the indirect side to which I have already referred—*i.e.*, the development of the mental faculties generally, and the cultivation of a true scientific insight. Without a systematic training, sole reliance must be placed either on continued experiment or on a highly developed instinct of discernment, in order to diagnose what must then be invariably regarded as phenomena.

Papers by Mr. W. B. Worthington and Sir H. F. Donaldson, K.C.B., were next considered. An abstract of them is given below:—

PRACTICAL TRAINING IN WORKSHOPS OR ON WORKS OF CONSTRUCTION, WITH SPECIAL REFERENCE TO TRAINING IN THE ENGINEER'S OFFICE.

BY W. B. WORTHINGTON, B.SC.

Practical training for the man who is to become an engineer—a member of a profession—necessarily includes two distinct things. On the one hand, during that part of his training spent upon works, he must, by observation and by taking some part in the work, acquire a knowledge of engineering operations, of economical methods of carrying them out, and of the time required for the purpose, as well as of the qualities and disposition of materials most suitable to meet varied circumstances. While so engaged, although he cannot, of course, during the short period of his training acquire anything approaching a sufficient knowledge of this side of his professional work, he will, if he is afforded fair opportunities and makes full use of them, lay a sound foundation on which further experience may be built up. Upon works of construction it is not necessary for the young engineer to do actual manual work, as is required of him if he is to gain a proper knowledge of the making of machines, but by availing himself of his opportunities of observation he will acquire that practical knowledge of construction which is essential to him in projecting and designing works.

Engineering as an art and profession is based upon the matter of design. It is true that even large works may be carried out by rule-of-thumb or by blindly following tradition, but the engineer in carrying out such works will make them the realisation of a pre-conceived and carefully regulated design.

There is some danger, possibly arising out of the very practical attitude adopted in this country towards engineering works and our national preference for results as compared with projects, that the importance of training in designing works under practical conditions may be lost sight of. It is with a view to check any tendency in this direction that the Institution has recently drawn attention to the necessity for every young engineer spending a substantial part of his training period in the engineer's office as well as in or upon the works. However good a man's training and experience on constructional works or in the shops may be, it will not, without experience in the engineer's office, make him a civil engineer, although it may make him a good mechanic or contractor. Mr. Ellington—dealing with the mechanical branch of the profession—in his presidential address to the Institution of Mechanical Engineers, illustrated most excellently the need for the combination of the works training with office training in the education of the engineer. He says:—"The great difficulty is to distinguish between a mechanical engineer and a good artisan on the one hand and the commercial man on the other. A very large number of men are employed in various capacities as managers, draughtsmen, engineers-in-charge, foremen and others who have really no ground for being considered mechanical engineers, but who in considerable numbers seek admission into our Institution."

During his term of office training, whether he be there as a pupil or as an assistant under agreement to serve for a term of years, the man who is to become a civil engineer should have the opportunity of becoming familiar with as great a variety of work as possible. He must gain experience in draughtsmanship and design, specifying, costs and estimating. On the other hand, the mere fact of being a member of the staff in an engineer's office will not train a man to be an engineer. He must, while in the office, see and deal with as many aspects and varieties of the work as possible, and he must, above all, have his training in or upon works, otherwise he may become a draughtsman, surveyor, clerk or commercial man, but will not become a civil engineer; just as, on the other hand, he may spend his time of training on or in works, and may become a skilled mechanic or a resourceful contractor, but without varied office experience he will not become a civil engineer.

PRACTICAL TRAINING IN WORKSHOPS OR ON WORKS OF CONSTRUCTION, WITH SPECIAL REFERENCE TO TRAINING IN THE ENGINEER'S OFFICE.

BY SIR H. F. DONALDSON, K.C.B.

With regard to general education anterior to the definite commencement of theoretical and practical courses, the author desires to touch on one or two points such as the importance of knowledge of modern foreign languages, for which he is of opinion that Latin forms an excellent groundwork; geography, physical, geological and ethnological; history, both of the world and of our own country; and literature, the love of which will frequently be found to be not only very valuable from a professional point of view, but extremely so for purposes of relaxation. To these he would add the more or less scientific study of accounting and book-keeping and allied commercial subjects.

The time available for the acquisition by a young engineer of his theoretical and practical education must very largely determine the completeness of these studies. The author thinks it cannot be properly effected in less than six years, or perhaps it would be safer to say seven years—that is, three years for theoretical study and three or four years for practical training. There should be no specialisation in the study of the theory, as such education should be as wide as possible. The question of specialisation does, however, make itself apparent in regard to practical training, because shortness of time available is so large a factor in the case. This fact may help in arriving at a decision on a subject so often discussed as to the precedence to be given in point of time to theoretical study or practical training. From this point of view, manifestly the theoretical study should precede the more or less specialised practical work. There is much to be said in favour of the proposal put forward by the Committee presided over by Sir W. White, that there should be a preliminary year on practical work directly after leaving school, followed by theoretical study for three years, returning to practical work again for two or more years. On the other hand, it may involve a break in the continuity of mental activity during the preliminary year's practical work, which in some cases it takes time to recover before the student is fit to take his place in the university lecture room. Matriculation before leaving school and evening work during that year would largely correct the mental atrophy suggested, but it is not always easy to give effect to such an intention. Whatever the sequence of the acquisition of knowledge, the author is strongly of opinion that six years represents the absolute minimum period necessary adequately to equip a young engineer, in some, if not most, classes of engineering. This minimum must, in order to comply with the Institution by-laws, be extended to seven years, of which four should be practical and office work.

Assuming, then, that the theoretical work should be taken first, after a year in the workshops, and that it will last three years, there remains the apportionment of the three or four remaining years out of the six or seven years to be considered. To do this it will perhaps be advantageous to consider the divisions of the practical course for each of the leading branches of the engineering profession, taking mechanical engineering, constructional engineering, electrical engineering and shipbuilding and naval architecture, as typical. The author places mechanical engineering first because, in his opinion, workshop practice is essential for all branches of engineering, and he puts the minimum for this course at three years, either all after theoretical knowledge has been acquired, or one year before and two years after that period. For a mechanical engineer he suggests the following apportionment of time:—

Machining	9 months
Fitting	9 ,,
Boiler-shop, erecting, mill wrights, electrical appliances for workshops	9 ,,
Pattern-making	3 ,,
Foundry	3 ,,
Smithy	3 ,,

This, it will be seen, occupies the full three years and is none too long, but it allows no time for office work, either drawing-office or otherwise, and leaves that part of the education to be taken as an extension to the workshop course. In order partially to meet the requirements of the by-laws, the author has arranged the distribution of three years for the young men joining the establishment which he has the honour to direct, as follows:—

Machining	8 months
Fitting	7 ,,
Erecting, millwrights, electrical appliances	8 ,,
Pattern-making	3 ,,
Foundry	3 ,,
Smithy	4 ,,
Drawing-office	3 ,,
	3 ,,

The sequence in which the various shops are taken should, of course, be arranged to suit not only the young man himself, but the nature of the work which is done at particular times in particular shops, and it is to be noted that in the second distribution mentioned, the time in the foundry has been increased by one month, based upon the author's experience of young men serving with him.

A young man so trained is, however, according to the strict letter of the by-laws, ineligible for election as an associate member, because he is unable to show 12 months' employment in an office. The author cannot but feel that a young man trained in the college and through such a course as he has referred to, is likely to become at an earlier stage a more useful assistant than one who has not had so complete a period of workshop practice, and he is unable to see how, with any shorter time, the same result is to be attained in the interests of the individual, the profession and the Institution. The strict reading of the by-laws does not appear to allow the Council much discretion in favourably considering an application from a man so trained who has only reached this stage in his engineering training by the time he is 25. The author understands that the Council have, on occasion, treated such cases somewhat specially, but he hopes that they may be able, in future, to widen such treatment, even to the point of extending the period during which a young man may remain a student sufficiently to allow of his securing the transfer to associate membership without cessation of connection with the Institution.

In the case of constructional engineering, or as it is too frequently called, civil engineering, the author would, in addition to the theoretical education, allot at least 18 months to the shops, with an additional six months for the acquisition of practical electrical experience, and arrange that he should pass into the office for a period of 12 months, or into an office combined with work on construction, which it is assumed would be regarded by the Council as complying with the by-laws. This apportionment of time in the individual shops should, in the author's opinion, follow the same ratio as the period sketched for the mechanical engineer's training, so that some knowledge at least of the requirements of the different shops would be acquired. In this case the young man would comply with the by-laws, but he would be in no really stronger position as an assistant than the young man undergoing the first suggested course for mechanical engineering.

As regards the electrical engineer, the author considers that besides three years' theoretical study, four years' practical training is required—that is to say, two years in the ordinary mechanical workshops, one year in electrical workshops, followed by one year of office experience. Here again the division of time in the mechanical workshops should be made on the basis of the complete mechanical engineer's course. There is in this case the same disability with anything short of four years' practical course as to election to associate membership as in the case of the mechanical engineer.

The same would apply to the Naval architect, where, however, the author would suggest one year in the mechanical workshops, six months in electrical workshops and two years on shipbuilding design, moulding loft and construction. Here again the time in each shop should be proportionate to the total period allowed for this part of the education.

DISCUSSION.

Prof. A. BARR (Glasgow) said every engineer should have a thoroughly good general education.

Mr. A. T. WALMISLEY (London) said in regard to civil engineering it was distinctly advantageous for an apprentice to have some actual workshop experience which he would not get in constructional works.

Prof. G. FORBES, F.R.S. (London) agreed that civil engineers should have workshop experience. Much of the real work of civil engineers was taken out of their hands by mechanical engineers, because of the latter's knowledge of metals and materials. He did not think that a definite time for each branch of training could be arrived at. As to the care of apprentices in the works it required someone above the ordinary workman and he (Prof. Forbes) thought the works manager was the best man to undertake this work. He was strongly in favour of the sandwich system, and, whatever was done at the university, a practical training in a workshop was absolutely necessary.

Sir WM. WHITE, K.C.B. (London) said that in Germany they had started technical training with the idea of sending the lad direct from the secondary school to the university. Ultimately, however, they had come to the conclusion that it was most desirable to break the course of theoretical study and to interpose a minimum period of one year in mechanical engineering workshops. In France the theoretical training was continued up to the age of 21 or 22 and the workshop experience followed, so that the engineer really never caught up the practical side, and most of them now agreed that it would have been better to have taken some practical training earlier.

Prof. LAMBERT (Glasgow) said a mistake could be made in trying to teach the apprentice too much on the technical side.

Mr. E. B. ELLINGTON (London) said they were apparently agreed that a practical workshop course was requisite in the training of an engineer,

Digitized by Google

no matter to what branch of the profession he might ultimately attach himself; and even with civil engineering some workshop experience was necessary. The only point at issue was when the practical training should be taken. Taking all the circumstances into consideration it would appear preferable for a lad to go to college first and to the works afterwards. A point that had not been dealt with and which should not be overlooked was that the important point in engineering was economy, and all apprentices should have a practical insight into production cost.

Mr. C. P. Hogg (Glasgow) said from the civil engineering point of view he had for years been considering how best to give a young man a practical training, but had not come to any conclusion. As a matter of fact it depended principally upon the young man himself. It was undoubtedly a great advantage to take the practical training concurrently with the scientific side. Those who went entirely through their college course before going to the workshop did not take kindly to the drudgery of that work.

Mr. A. P. Trotter (London) said the sandwich system presented marked advantages. The profession was constantly changing, and what was advisable in the past might not be the ideal at the present time. The advantage of taking the works course after the college was that the young man was in touch with his work and stood a better chance of finding a job than would a man from college who had taken his practical training previously. As to the principles of prime cost that could, he thought, be taught in the colleges.

Mr. F. O. Everard (Birmingham) said the sandwich system so far as he had tried it had been particularly successful. Otherwise he had found that a college course first followed by a workshop training to be the best for students.

Mr. J. W. Wilson (London) said a great deal depended on the early training of the lad, and this should be followed by a combination of theoretical and practical training.

Thursday, June 29th.

The proceedings on the second day commenced by a joint meeting of Sections II. and III., over which Dr. W. C. Unwin, F.R.S., presided. The meeting opened by some remarks from the chairman, of which we give an abstract below :—

It has been thought desirable by the Council to impose on the chairman of a section the duty of saying some introductory words. I think it may be taken for granted that it is now agreed that engineering training should include scientific instruction and practical and commercial experience. But very divergent views are held as to the relative importance of the different components of such a training and as to the order and duration of each. We must recognise at once that the field of engineering employment is a very wide one, and that different capacities are required in different parts of that field. It is therefore in no way surprising that persons, whose opportunities of observation give them every right to express a definite opinion as to what is best for one special branch of engineering, have arrived at conclusions very different from those held by others, whose field of work has been in a different branch. No system of engineering training can be arranged to meet all special demands, and it is the object of such a Conference as this to find out what is most essential in all courses of training and what modifications are practically possible to meet different cases.

First of all, I think it must be assumed that the engineering education we are specially charged to consider is that of young men whose aim it is to arrive ultimately at a professional status, such a status as membership of this Institution implies. Their hope is to be employed ultimately in the design and control and direction of engineering work. Of course, some of them may fail in capacity or may lack opportunity, and may drift to one of the many commercial occupations allied to engineering, and even there the knowledge they have acquired will be a valuable asset. But at the outset a professional career is aimed at, and the system of engineering education must be arranged to meet that condition. It is probably only by educating many that the few can be found who have the capacity and character necessary to achieve considerable advances and to do work of national importance.

Now, very few young men at eighteen can foresee into what line of employment they may be driven, and consequently the first or undergraduate stage of education must be broad, so as to fit students for widely different spheres of work. Perhaps the greatest defect of engineering education at present is the want of more provision for the higher and more specialised education of the few students of real capacity, discovered in the sifting process of an undergraduate course. In spite of the general acceptance of the view that a study of scientific principles and their application is a necessary preliminary to a practical course in field or workshop, a certain jealousy of college education is still obvious in some practical engineers. While conceding in words that some scientific education is necessary to an engineer, they would, in fact, confine it to very elementary matters. They would greatly restrict the time given to it, and they are disposed to depreciate the value of any higher teaching and even to regard it as mischievous and likely to unfit a man for the strenuous life of the manufacturing workshop.

I believe the idea that a college course unfits a man for practical work is a wholly mistaken one. There may be students who prove unfit for practical work in spite of college education. They would equally fail if their education was purely practical. There may be college courses—I am afraid it must be said there have been college courses—badly arranged, and teachers in colleges less competent than is desirable. But such things are inevitable. Nothing is more certain than that there has been a great improvement of college teaching of applied science in the last 20 years.

An employer who takes into his works college students is, I think, often disposed to expect from them an immediate availability which is unreasonable. It is not the main object of a college course to make a student acquainted with the details of any particular business; that is the proper object of the first year or two of practical work. It is not the main object of a college course to fit students specially for such work as will fall to them while in the lowest rank of the profession. The college course must contemplate the fitting of a student for his whole career and provide him with an intellectual equipment which will only gradually become useful as he rises to higher rank in his profession. The view of the employer who looks only to the immediate usefulness of the student is a short-sighted one.

Nevertheless, a college course is an unpractical and badly designed one if, at the end of it, a student is not more capable and useful from the first, in any type of workshop, than a lad without such a training. The college discipline is bad if he has not much more character and energy than the raw lad. His training has been a failure if he does not pick up the specialised details of any business to which he may be put far more rapidly than an untrained lad. I should like to suggest to those practical engineers who are implicitly if not openly hostile to college training, who would, at any rate, greatly restrict it and who advocate lengthened periods of workshop apprenticeship that they exaggerate the value of such workshop experience as an ordinary apprentice gets. I am not, of course, considering artisan apprentices, but young men expecting to rise to positions of trust. Here and there are works where special trouble is taken with apprentices; but in general apprentices are left to pick up what knowledge they can with very little help, and in many cases, I think, a good deal of their time is absolutely wasted. Some skill of handicraft is no doubt acquired. But the engineer works with his head, not with his hands, and manual skill is of use to him only in very exceptional cases.

I hope I do not in any way underrate the value, to mechanical engineers especially, of that kind of knowledge of materials, of tools, of processes, and of cost, which can only be learned in the workshop. But I think practical engineers forget how little of this valuable knowledge really comes to the works apprentice. The engineer of higher rank who discusses matters with foremen and draughtsmen, who has responsibility for design and cost and who is in a position to know the reason of all decisions, is learning in the workshop all his life, and naturally sets a high value on the knowledge slowly acquired by years of constant and close observation. So high a value that perhaps he ignores the importance of the scientific knowledge which was, somewhere and by some one, applied in bringing his business to a state in which it can be carried on successfully as a mere manufacture. But the knowledge which comes to those in responsible positions is not open to the ordinary apprentice and he learns slowly, if at all, unless he brings to the works such knowledge of principles and methods that he can interpret for himself what he sees. No system of workshop apprenticeship can, I think, be considered satisfactory unless someone is specially charged with care of the apprentices, whose duty it should be to make sure that they have opportunity of seeing a great variety of work and helping them over their difficulties.

I believe employers will find—some of them have found already—that they owe a debt to the colleges, and that the college-trained student will prove, with a minimum of special experience, a valuable assistant, and in some cases the originator of a real advance in practice. I should like to plead that in return the employer might be a little more ready to give college students a year or two years' run of the works, either without remuneration or with a small remuneration just enough for disciplinary purposes. I do not think there would be any loss in the case of a properly trained student, and the employer would in many cases find an assistant worth keeping and promoting.

Next two short Papers were read by Mr. J. W. Horne and Prof. J. E. Petavel, F.R.S., in introducing the morning

Digitized by Google

subject for discussion. The following is an abstract of Mr. Horne's Paper:—

THE RELATION OF ENGINEERING EMPLOYERS AND COLLEGES FROM THE POINT OF VIEW OF THE PRACTICAL TRAINING OF COLLEGE STUDENTS.*

BY J. W. HORNE, B.SC.

The Report of the Committee on Engineering Education and Training of 1906, has exerted a very effective influence in improving the system of engineering education and training, and, as a result, the engineering training of the university and college type of to-day is a great improvement on apprenticeship practice existing some years ago. The university and college type of trained engineer is of recent creation, and in every field of engineering his influence is being felt. This type has undoubtedly come to stay, and will be produced by these institutions in ever-increasing numbers.

The consensus of opinion among engineers of experience and standing of the present day appears to be that the youth who wishes to become an up-to-date engineer and have a successful career in the profession, having reached matriculation standard at school, should preserve the continuity of theoretical study and proceed at once to university or college for two or more years. Many engineering employers, during the last few years, have recognised that systematic scientific education of the modern university and college type is very essential to the future progress of engineering science, and in consequence have extended sympathetic assistance to college students by granting them facilities to obtain practical experience in their workshops, in order that they might have the opportunity to build up that "engineering instinct" which is so necessary to become a successful engineer. The authorities of the universities and colleges, also recognising the necessity for this workshop period after the completion of the college course, endeavoured, and with very considerable success, to arrange with a number of engineering firms in the industrial centres in which they are situated to co-operate with them in granting college students the privilege of this workshop training. But what strikes one, after a careful study of the apprenticeship schemes as arranged by the college authorities, is that the co-operation between college and employer is not sufficiently definite, as will be seen from the following, taken from the scheme of one of our best organised colleges:—"Students who desire to serve their apprenticeship with one of the after-mentioned firms must communicate direct with the firm and make their own arrangements." By this system it is possible, and, as a matter of fact, in my own experience in many instances it has happened, that suitable students, possessing the necessary personality and "engineering instinct," will lose much time, after leaving college, through having been unable to make arrangements to proceed to their practical training at once, and that others will have promising engineering careers blighted by being unable, through lack of influence and means, to arrange for their practical training. It is an undoubted fact that only a certain proportion of engineering students who finish their college course successfully are suitable to proceed to the workshop for practical training, and the purpose of this note is to suggest an arrangement to ensure that engineering employers shall be asked to give facilities for the practical training of only the most suitable students.

The professors of engineering subjects in the universities and colleges are, as a rule, qualified engineers, who have had considerable experience of works' practice, and, in consequence, they are in a unique position, after three years' close contact with the students, to select the most suitable, from the point of view of ability, personality and grit, to take full advantage of their years of workshop practice, and this method of selection would ensure that want of influence, poverty, or social circumstances, would be no bar to a suitable student completing his engineering training. The selection could be made before the completion of their course and arrangements made so that no time should be lost.

In the provincial industrial centres it would seem to be a not very difficult problem to arrange for a close and definite co-operation between the engineering employers and the heads of the engineering departments of the colleges on the above lines, in view of the fact that the "civic" universities, such as Manchester, Birmingham, &c., and the technical colleges, such as Glasgow, have been built and richly equipped by contributions from the local captains of industry, who in this way have shown a living interest in the advancement of scientific training. The governors of these provincial colleges, in order to have the education thoroughly in keeping with the advance in industrial methods, have adopted a liberal policy in their methods of management, and in order always to be in close contact with the various industries in their district, they have adopted the wise policy of co-opting leading representatives of the various firms to act on the committees of each department. It would appear, therefore, to be a simple matter for each centre to form a strong committee, in connection with the college, composed of these influential representatives and the heads of the engineering departments. The duties of this committee would be:—To consider the selection of students made by the professors; to make arrangements with the firms who are willing to grant facilities for practical training to start these immediately on the conclusion of the college course; to arrange that recommendation 9 of the Report is carried out as far as possible; and to induce a still greater number of firms to grant such facilities.

The question of an arrangement on the same lines between the colleges and polytechnics in London and engineering employers is much more complicated and more difficult to solve. In London a number of unconnected colleges and polytechnics came into existence during the latter part of the nineteenth century, due in a great measure to the subsidising of engineering training by the wealthy and generous City companies, with the result that there is not as yet any central governing body who could act in unison with the various colleges and with engineering employers in London and the provinces to arrange for the practical training of all the most suitable students educated in the London colleges. In consequence of this condition of affairs, each college has had to make its own arrangements, with the result that many capable students have been unable to arrange for their practical training. The Imperial College of Science and Technology has now been in existence for some years, and has nearly completed its equipment in all departments of science, an equipment which, I believe, is second to none, and will soon be in a position to produce students of the very highest standard of college training, for whom the very best facilities for workshop training must be found. Why should united action not be possible between the Imperial College of Science and the polytechnics? Why should not a central committee be formed with its headquarters at the College of Science, composed of the heads of engineering departments of these unconnected colleges, and representatives from the London managers of engineering employers and manufacturers to work on lines already suggested in the case of the provinces? This committee would be in a position to ensure that all the most suitable students in London would obtain their practical experience.

There is still another important problem which is worthy of mention in this note, a problem which has arisen in England during the last few years owing to the advance made in general education, and which is now pressing for solution. I am personally most deeply interested in it, and I consider this conference a most favourable opportunity to bring it to the notice of college authorities and the representatives of county education committees in England. During the last few years, engineering firms in this country have developed a very keen interest in the better education of the engineer's apprentice who starts his apprenticeship at 16 years of age. Every encouragement is given to him to attend evening continuation classes, and several firms allow the best of them to attend classes one or two afternoons a week. The result of this interest is that a certain proportion of these have, by means of such facilities, been able to reach a standard of education which qualifies them to proceed to a fully-equipped college for two or three years of specialised study in the day time. Want of means and lack of an adequate system of scholarships with maintenance allowances, however, prevent them from proceeding further in their ambition. These apprentices, trained in this manner, are a very valuable asset to the nation, and I would suggest to the education authorities that they should adopt a scheme whereby the best of them would derive the benefit of systematic scientific education in the day time at one of the fully-equipped colleges. The organisation of such a scheme must ensure that poverty or social circumstances shall not prevent access to the highest forms of training that the community can provide.

(To be continued.)

* Abstract.

Competitive Illuminants.—In a report on this subject presented at the recent Convention of the National Electric Light Association it is mentioned that not more than from 60 to 70 per cent. of the laboratory rating of candle-power can be obtained from gas lamps under service conditions, this statement being borne out by tests by gas engineers. In general, a tungsten lamp having two-thirds the mean spherical candle-power shown by an incandescent gas lamp in a photometric test, will, under service conditions, produce an equivalent or greater illumination than the gas lamp, provided that the distribution of light from the two units is equally favourable.

The Rates for Subscription to "THE ELECTRICIAN" are as under:—

	Year.	Half-Year.	Quarter.	
United Kingdom	26s. 0d.	13s. 6d.	7s. 0d.	Post free, payable in advance.
Canada	28s. 3d.	14s. 6d.	7s. 6d.	
Postal Union ...	30s. 0d.	16s. 0d.	8s. 0d.	

New volumes of "THE ELECTRICIAN" *commence in April and October.*

(This charge includes all the numerous Supplements.)

Vols. I to LXVI. can now be supplied. Price on application.

"THE ELECTRICIAN" SERIES OF STANDARD ELECTRICAL BOOKS

can be obtained of all Booksellers at Home, in the Colonies, and Abroad.

"THE ELECTRICIAN" ELECTRICAL TRADES' DIRECTORY AND HANDBOOK. Published annually in February, corrected to mid-February. Established 1892. A very valuable advertising medium, covering the entire Industry. SUBSCRIPTION Price (which is received *in advance* up to Jan. 31st in each year for the next following edition) 8s. 6d. nett, postage 9d. extra. Published price 15s. nett, postage 9d. extra. Postage to British Colonies, 2s.; Europe, 2s.; U.S.A., 3s. 6d.; other countries, 2s. 6d. *Digest of Contents of the 1911 Edition sent free on application.*

THE PRACTICAL WIRELESS SLIDE RULE. By Dr. H. R. Belcher-Hickman. Price 2s. 6d. nett.

LIVINGSTONE'S DIAGRAM FOR THE EASY CALCULATION OF SHAFT AND BEAM DEFLECTIONS. By R. Livingstone. 2s. 6d. nett. By post in tube, 2s. 10d.

"THE ELECTRICIAN" PRIMERS (81 Primers in all, and a GLOSSARY). Single Primers 3d. each post free. *New and Enlarged Edition in One Complete Vol. or Three Separate Vols.* FULL PROSPECTUS FREE.

ELECTRIC TRACTION ON RAILWAYS. By Philip Dawson. Price 25s. nett. *Prospectus free.*

ALTERNATING-CURRENT MOTORS. By Dr. Rudolf Goldschmidt. Price 6s. 6d.

THE SHOT-FIRER'S GUIDE: A Practical Manual on Blasting and the Prevention of Blasting Accidents in Mines, Quarries, &c. By W. Maurice. Price 3s. 6d. nett.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. Wilkinson, M.I.E.E. *New Edition.* Now ready. Price 15s. nett.

ELECTRIC BLASTING APPARATUS AND EXPLOSIVES: With Special Reference to Colliery Practice. By W. Maurice. Price 8s. 6d. nett.

THE ELECTRIC FURNACE IN IRON AND STEEL PRODUCTION. By John B. C. Kershaw, F.I.C. Price 3s. 6d. nett.

BRAKES FOR TRAMWAY CARS. By H. M. Sayers. Price 3s. 6d. nett.

THE MECHANICAL DESIGN AND CONSTRUCTION OF COMMUTATORS. By R. Livingstone. Price 6s. nett.

THE ALTERNATE-CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Prof. J. A. Fleming, M.A., D.Sc., F.R.S. [abroad 13s.

VOL. I.—Price 12s. 6d. post free, abroad 13s. VOL. II.—Price 12s. 6d. post free, abroad 13s.

HANDBOOK OF THE ELECTRICAL LABORATORY AND TESTING ROOM. Very fully illustrated. By Dr. J. A Fleming. Vol. I., 12s. 6d. nett. Vol. II., 14s. nett.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. Fleming. 6s. nett.

ELECTRICAL LABORATORY NOTES AND FORMS. Arranged by Dr. J. A. Fleming, M.A., F.R.S. Single copies 4d. nett, or in dozens at 2s. 6d. nett. *Complete Sets of 50* Notes and Forms, 12s. 6d. nett, or in strong portfolio, 14s. nett; or bound in strong cloth, 15s. nett. Spare Copies of Tabular Sheets, 1s. per dozen. Portfolios, 1s. 6d. each. Sectional paper, 1s. per dozen sheets. *Complete Prospectus post free on request.*

ELECTRICITY METERS: THEIR CONSTRUCTION AND MANAGEMENT. By C. H. W. Gerhardi. Profusely illustrated. Price 9s. nett.

ELECTRICITY IN HORTICULTURE. By Prof. S. Lemstrom. Illustrated. 3s. 6d nett.

RADIO-ACTIVITY. AN ELEMENTARY TREATISE, FROM THE STANDPOINT OF THE DISINTEGRATION THEORY. By Fredk. Soddy, M.A. Fully illustrated. Price 6s. 6d. nett.

ELECTROMAGNETIC THEORY. By Oliver Heaviside. Vol. I. Price 12s. 6d. Vol. II. Price 12s. 6d. *Vol. III. in the press.*

MOTIVE POWER AND GEARING FOR ELECTRICAL MACHINERY. By E. Tremlett Carter, C.E., M.I.E.E. Revised by G. Thomas-Davies, A.M.I.E.E., F.C.S. Price 12s. 6d. nett.

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. Ewing, B.Sc., F.R.S., F.R.S.E. Price 10s. 6d.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. Kennelly and H. D. Wilkinson, M.I.E.E. Price 6s. 6d.

ELECTRIC MOTIVE POWER. By Albion T. Snell. Price 10s. 6d. nett.

A POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. Gelpel and H. M. Kilgour. Price 7s. 6d. nett.

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. Elton Young. Price 10s. 6d.

STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By H. K. C. Fisher and J. C. H. Darby. Price 7s. 6d. nett.

SIGNALLING ACROSS SPACE WITHOUT WIRES: THE WORK OF HERTZ AND HIS SUCCESSORS. With new Chapter on Tuning. By Dr. Sir Oliver J. Lodge. Price 5s. nett.

THE ART OF ELECTROLYTIC SEPARATION OF METALS. By Dr. G. Gore, LL.D., F.R.S.

ELECTRO-CHEMISTRY. By Dr. George Gore. Price 2s. [Price 10s. 6d.

BEGINNER'S MANUAL OF SUBMARINE CABLE TESTING AND WORKING. By G. M. Baines. Price 7s. 6d. nett.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By Francis Jehl. Price 10s. 6d.

"THE ELECTRICIAN" WIREMAN'S POCKET BOOK. Price 5s. nett.

"THE ELECTRICIAN" HANDY WIRE TABLES FOR THE POCKET. By P. B. Down, Wh.Ex., A.M.I.Mech.E. Price 2s. 6d. nett.

THE RATING OF ELECTRIC LIGHTING, ELECTRIC TRAMWAY, AND SIMILAR UNDERTAKINGS. By W. G. Bond, M.I.E.E. Price 2s. 6d. nett.

DRUM ARMATURE WINDING AND COMMUTATORS. By F. M. Weymouth. 7s. 6d.

PRIMARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By W. R. Cooper. Price 10s. 6d. nett.

SECONDARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By E. J. Wade. [Price 10s. 6d. nett.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. Price 1s. 6d.

THE LOCALISATION OF FAULTS IN ELECTRIC LIGHT CABLES. By F. C. Raphael. 7s. 6d.

THE STEAM-ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. Beaumont, M.I.C.E., M.I.M.E., &c. Price 6s. nett.

THE ELECTRIC ARC. By Mrs. Ayrton. M.I.E.E. Price 12s. 6d.

TRAMWAY TRACTIVE EFFORT AND POWER DIAGRAM. By Arnold G. Hansard, B.A., A.M.I.E.E. Price 4s. 6d. nett; in Tube, 5s.

THE BRITISH POST OFFICE TELEPHONE SERVICE. Fully illustrated. Price 3s. 6d. nett.

INTERNATIONAL TELEGRAPH CONVENTION AND SERVICE REGULATIONS. Price 6s. nett. (LISBON REVISION, 1908.)

BOILER FEED WATER. By F. W. Anderson. Price 6s. nett.

(PRELIMINARY) WIRELESS TELEGRAPH CONFERENCE (BERLIN, 1903), PROCEEDINGS AT. Price 8s. 6d. nett.

INTERNATIONAL WIRELESS TELEGRAPH CONVENTION AND SERVICE REGULATIONS (BERLIN, 1906). With complete report of Proceedings. Price 21s. nett.

THE TWO-TONE VIBRATING TRANSMITTER AND CABLE INDUCTIVE SIGNALLING. By Edward Raymond-Barker. Price 1s. nett and post free. [Price 3s. nett.

THE CLASSIFICATION OF ALTERNATE-CURRENT MOTORS. By V. A. A. Fynn, M.I.E.E.

ELECTRIC CRANES: THEIR DESIGN, CONSTRUCTION AND APPLICATION. By H. H. Broughton. Being Vol. I. of a Complete Manual of Lifting and Hauling Machinery. *Ready shortly*, price 25s. nett.

MANUAL OF THE TELEPHONE. By W. Aitken, M.I.E.E. *Nearly ready.*

ELECTRIC MAINS AND DISTRIBUTING SYSTEMS. By J. R. Dick, B.Sc., and F. Fernie, A.M.Inst.C.E. *Nearly ready.*

ELECTRICAL MANUAL FOR MINING ENGINEERS. By H. J. S. Heather; M.I.E.E. *Ready shortly.*

THE MECHANICAL DESIGN AND CONSTRUCTION OF GENERATORS. By R. Livingstone. *In Preparation.*

STUDIES IN LIGHT PRODUCTION. By R. A. Houston, M.A., Ph.D., D.Sc. *In Preparation.*

LIGHT, RADIATION AND ILLUMINATION. From the German of Paul Hogner, by Justus Eck. *In Preparation.*

WIREMAN'S POCKET BOOK AND ELECTRICAL CONTRACTOR'S HANDBOOK. Compiled by A. W. Robinson and W. E. Warrilow. *Nearly ready.*

"THE ELECTRICIAN" INDUSTRIAL SUPPLEMENT.

With "THE ELECTRICIAN" for Sept. 14, 1906, was issued the first of a series of "Industrial Supplements," to be published from time to time with "THE ELECTRICIAN." The fifty-third issue of the Supplement published (Gratis) with the number of "THE ELECTRICIAN" for September 23, 1910, was the last of the monthly issues. "THE COMMERCIAL AND INDUSTRIAL SUPPLEMENT" to "THE ELECTRICIAN" is now issued weekly (Gratis). It will be found towards the end of the present issue.

NOW READY.

Vol. LXVI. of "THE ELECTRICIAN." Bound in Publisher's covers. Price 17s. 6d. Postage U.K. 1s. extra, abroad 2s. 6d.

Cases for binding Vol. LXVI. are now ready, price 2s.; post free, 2s. 3d.

THE EDUCATION CONFERENCE.

The Education Conference recently held by the Institution of Civil Engineers resulted in a representative gathering and the presentation of numerous Papers. In fact, the number of Papers (although they were short) was so large, and the discussion so considerable, that we have found it necessary to continue the account of the Conference in several issues, and thus a further instalment of the proceedings will be found in the current number. In a sense it may be said that very little that was new was brought forward, but it is almost inevitable that this should be the case. There was the same conflict of opinions as there has been for many years; but, nevertheless, we think it may be said that a more definite policy is beginning to shape itself.

In regard to elementary education, there is no longer any question as to the value of science, but it will perhaps be admitted that those who have the cause of science at heart have not made out a thoroughly good case for the abolition of classics. In fact, most all-round men will probably agree that a classical education is desirable up to a certain age; and it seems to be the case, which is somewhat remarkable, as mentioned by Dr. JAMES GOW, that boys who have been given a classical education take more readily to science when they are given the opportunity than do boys who have merely been on the modern side. Perhaps this is due to the instructional methods being better in classical education than in other branches, and that consequently the boys are taught to learn classics in a better way than modern languages or science. To teach a boy how to learn should certainly be one of the primary objects of education. After a certain

Digitized by Google

age, however, we think there is no question that science and modern languages should take precedence of classics. Modern languages are increasingly important, and it is not sufficient to have a mere school-boy knowledge by which sentences in a foreign language can be translated with a dictionary, or to have an accent which no foreigner can possibly understand. A serviceable conversational knowledge is most important.

As to science in elementary education, we do not think there is any question of the correctness of Prof. S. P. THOMPSON's view that the aim of the teacher should be to awaken interest. A broad knowledge is what is required, and no boy can get much knowledge worth having if his interest in the subject is not evoked. The much-talked-of heuristic method may be all very well in moderation, but it is liable to be deadly dull, and, in our opinion, the teacher should make use of this method with extreme caution. Apart from this dullness, the time available is often insufficient. When speaking of methods, however, it is rather necessary to bear in mind that teachers cannot teach to the best of their ability if they are hampered by inspections and an examination syllabus.

Passing from the school to the college, there is the question whether any specialisation should take place, and whether the matriculation should be a test of general education or of specialised knowledge. We agree with Prof. SCHWARTZ and Prof. A. BARR that there should be no specialisation in the school, nor should there be specialisation in the college, for the simple reason that men seldom follow the initial line on which they start their profession. Many men have suffered from over-specialisation which has made it impossible for them to turn from one branch of the profession to another. Opportunities sometimes arise which render it very desirable to change from one line of work to another; this, however, cannot be done without breadth of training, but if the breadth of view has been sufficient a change from one branch to another is often extremely advantageous.

There was, of course, a good deal of discussion as to the position that should be taken by shop training. Sir H. F. DONALDSON gave what he considered a suitable syllabus for this part of the training with the length of time in each of the shops, the programme depending on the line desired by the student. The syllabus laid down necessitates spending three years in the shops, but we very much doubt whether this is in any degree necessary or desirable. Take, for example, fitting. It is certainly advantageous that the engineer should have a general knowledge of the work comprised under this term, but whether he can use his file as a trained fitter or whether he fails to file a reasonably true surface to the end of his days, it will make little difference to his professional career. The fact is that it is not necessary for the engineer to be a trained turner, or fitter or pattern maker, but it is very desirable that he should have a general knowledge of the methods followed in fitting, turning and pattern making, and in the other shops comprised in an engineering works.

Another subject which caused a good deal of discussion was the "sandwich" system. Mr. YARROW pointed out the disadvantages that surrounded pupils living in the Midlands away from home influence during the time they spent in the shops, and he suggested that if the summer six months could be spent in the shops and the winter could be passed at college the social conditions would be very much better. We do not doubt that this would be so, and it would be a great advantage if such an arrangement could be made, but it is difficult to see how this could be done, both from the point of view of the works and from that of the college.

There certainly seems to be a consensus of opinion in favour of the sandwich system. The fact must be faced, however, that no workshop can be expected to take pupils in for short intervals, such as three months at a time, and we doubt even if six months would be acceptable. It appears to us that by far the best arrangement is for the student to spend, say, a year at college, then a year at the works, followed by another year or two at college, with a further year in the shops, if desirable, sandwiched between those two years at college. A system of this kind has been in vogue for years at Faraday House, and we believe the result has been satisfactory. The subject is one of great importance, because there is no question that workshop training is a distinct advantage; but most students after they pass through college often feel the temptation to accept a salaried post, if such is to be found, too great for them to go into the shops in receipt of nothing. We hope that our colleges may be induced to look into this question further with a view to seeing if a satisfactory solution cannot be found.

REVIEWS.

(Copies of the undermentioned works can be had from THE ELECTRICIAN Office, post free, on receipt of published price, adding 3d. for books published under 2s. Add 10 per cent. for abroad or for foreign books.)

Encyclopédie Electrotechnique. By L. BARTILLON. Parts 38 and 39: Regulation des Groupes Electrogènes. (Paris: L. Geisler) Pp. 165 and 127. 25 fr. per part.

The subject of the regulation of electrical generating sets is one which, in a general sense, is of interest to a large number of engineers; in fact, it should be of interest to all station engineers. The mathematical treatment of the subject will, however, only appeal to a few—probably to engine and dynamo designers. In the two parts of the "Encyclopædia of Electrotechnics" devoted to this subject the treatment is entirely of a theoretical and mathematical nature, so that the treatise under review will appeal rather to the specialist and designer than to the average station engineer.

Dealing first with the treatise as a whole, the work is a fairly complete treatment of the problems relating to the speed and voltage regulation of generating sets. The text is well illustrated by a large number of clearly-drawn diagrams. There are relatively very few typographical errors; a few such errors are to be expected in the first edition of a work containing a large number of mathematical proofs. The treatment throughout is clear, but mathematical.

The subject-matter is divided into 11 chapters, of which six are included in the first part. The early chapters are of a general nature, being devoted to a study of the voltage regulation of dynamos, the speed regulation of prime movers, in particular the reciprocating steam engine. The function and action of flywheels and governors are clearly set forth. Typical turning moment diagrams for various engines are given, and the harmonic analyses of the various curves set out in tabular form. The isochronism, stability and sensibility of governors are all discussed at some length.

Two chapters are given up to an analytical and graphical treatment of direct-acting centrifugal governors under various conditions of generator load. The first part of the work is

Digitized by Google

concluded by a chapter on speed control by means of relay governors.

Of the five chapters included in the second part of the book, the first is devoted to the study of various forms of governors. The second chapter deals with the calculation of flywheels for troubled conditions of working. The next chapter is a full analytical treatment of the action of governors, and includes the method of obtaining the various curves connected therewith. This is, of necessity, a chapter containing many mathematical proofs. The section which follows is of quite a different nature, and deals more particularly with the purely electrical branch of the subject; it is devoted to voltage regulation at constant speed. The concluding chapter relates to the variations in speed of a generating set in which the speed and voltage are both regulated. There is also an appendix dealing with the theory and operation of Routin's automatic regulator.

The subject-matter is confined to problems connected with reciprocating steam engines and water turbines. In view of the present use of steam turbines, gas engines and oil engines as prime movers for generating sets, we think some space might well have been devoted to problems affecting the speed and voltage control of generators driven by such engines.

For so cheap a book, however, the work is quite a good one, and can be recommended to those who wish to understand fully the theory of the subject. The book will not appeal, however, to those who have no taste for mathematics.

Exercises in Electrical Engineering. By T. MATHER, F.R.S., and G. W. O. HOWE. (London: Edward Arnold.) Pp. 71. 1s. 6d. net.

Technical exercises may be roughly divided into two classes. Those which produce facility in the application of certain principles or formulæ, and those which "give furiously to think." Old students of the Central Technical College will remember that the latter were great favourites with the late Prof. Ayrton, and his "take it as an exercise" sounds familiarly in our ears when we read this little book, in which Profs. Mather and Howe have thoroughly kept up the traditions of the College. The subjects dealt with cover a very wide field of both theory and practical application, and a student who has thoroughly worked through it should have few terrors in store for him in practical problems. Especially good are the questions dealing with electromagnetism and induction, which are too often slurred over in ordinary books, and in which subjects so many pitfalls are found.

The subjects dealt with commence with units, Ohm's law and energy calculations, and thence pass to magnetism and electromagnetism, forces on conductors, inductance, instruments, and dynamo and motor problems, including starters. This takes up the first 36 pages, and we then have 14 pages of alternate-current exercises in which some searching questions concerning capacity are found, as well as fundamental questions on alternators, transformers and motors. Here one might have liked to see a little amplification, notably as regards the bringing-out of the distinction between total and leakage inductance, which gives rise to so much confusion. Electric traction, secondary cells and lamp problems complete the series.

There can be no doubt that in this little book Profs. Mather and Howe have produced a set of exercises many of which will be of considerable assistance to other teachers, and which will help towards that clear thinking and appreciation of fundamental principles which is so frequently and painfully lacking at the present time.

SOME RECENT DEVELOPMENTS IN RAILWAY TELEPHONY.*

BY G. BROWN.

The requirements which have to be met by the telephone to render it suitable for train-despatching as carried on in the United States are the following: Ability to signal any one of 50 or more stations on a 250-mile line, and ability to signal the despatcher from any of the stations. Arrangements whereby any number of stations can simultaneously listen in. Means for quickly testing and patching any portion of the circuit which gets into trouble.

In addition to the above requirements, the telephone owing to its greater flexibility can be arranged to permit of other operating advantages not possible with the use of the telegraph. Among these are the following: Provision whereby officials who are not telegraph operators, but who are directly interested in the movement of traffic, as, for instance, train masters, yard masters, division superintendents, &c., can listen on the wire and keep in touch with traffic conditions. Arrangements permitting the signalling of stations without interrupting conversation. This feature results in saving a considerable amount of time. Automatic notification to the dispatcher that the station he is calling is receiving the signal. As regards signalling to any one of 50 or more stations, this is a condition which is not met with in ordinary practice. The instrument used is known as a selector, and is so designed that the despatcher can at will cause any selector to operate, and ring the bell at any particular station. This is at present done in three ways. A certain number and sequence of long and short impulses may be sent to which only the instrument at a particular station will respond; a number of instruments may be set to work in synchronism, the despatcher's sending device being so arranged that at a pre-determined instant one impulse is sent out on the line which at this instant is provided with a path through one selector only; step-by-step instruments which operate together by a succession of impulses from the despatcher's office may be used.

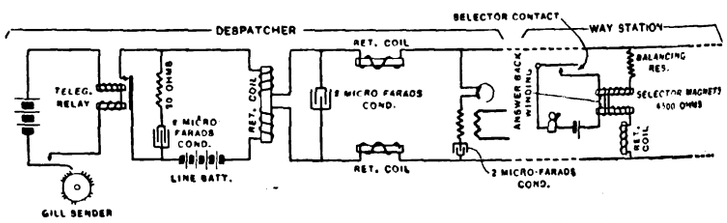

FIG. 1.—NEW ARRANGEMENT OF LINE CIRCUIT. GILL SYSTEM.

A typical instrument in the first class is the Gill, which consists essentially of a ratchet wheel, an electromagnet whose armature is arranged to step the wheel forward, a retaining pawl to retain the teeth stepped, and a mechanical time element whose function is to permit the retaining pawl to assume either one of two positions according to the length of the impulse of current. The time element consists of a metal wheel fastened to a small diameter shaft so arranged that it can roll down an inclined rod. This shaft will reach a lower hunting position if the impulse last long enough. The teeth are cut away, and in order that the retaining pawl may hold each tooth stepped of a given selector, its position with relation to the face of the teeth must be such that at no time does it rest against a position of a tooth face that has been diagonally cut away. This condition is brought about only in the case of a selector which is being operated by its proper sequence of long and short impulses, and this is the only selector that will close its contact and signal its station.

The latest type of circuit used with this arrangement is shown in Fig. 1. In this arrangement there are no earths on the line and no line relays used. The selectors are wound to 4,500 ohms, and are placed directly across the line. In series with the selectors is placed the proper amount of tapering resistance, so that the amount of signalling current through each bridge will be the same. The answer back is obtained by including, in series with the selector contact bell and battery, a secondary winding on the spools of the selector. As the bell vibrates it induces current in the selector windings which produces a tone in the despatcher's receiver. With this circuit arrangement the normal current for the operation of the selectors is 10 m.a. The current, however, can fall considerably below this without affecting the operation of the selectors. The retardation coils and condensers at the despatcher's end of the line are used to cut down the peak of the current wave to such a point that the noise in the receivers while the signal is being sent is not enough to interfere with conversation. In this circuit it is necessary

* Abstract of a Paper read before the American Institute of Electrical Engineers.

Digitized by Google

to introduce a condenser in series with the receivers across the line in order that the signalling current may not be shunted through the talking bridges.

In the second arrangement the master selector consists of a standard clock-work mechanism, to the second hand of which is attached a contact arm. In the path of this contact there are 30 insulated segments which are arranged so that any one of them can close battery current through a relay when the contact arm engages with this particular segment. The despatcher depresses locking push buttons, and then operates the key mechanism. This mechanism is merely a retardation device arranged so that when operated a contact is made for a length of time sufficient to operate the relays which start the master and all the station clocks. The sub-station selector is similar to the despatcher's clock mechanism except that each station is equipped with but one contact arranged to engage with the revolving arm. These contacts at the various stations are adjusted at different angular displacements from the normal position of the contact arm. When the despatcher has started all the clocks simultaneously, it is evident that the contact arm on the master selector will have reached, say, its tenth point at the same instant that the tenth selector has reached its point. At this instant there are no other selectors which are on their contact point, and due to the fact that the tenth point on the despatcher's clock is connected by means of a locked push button to cause current to flow on the line, the signalling mechanism at the desired station will be operated. Fig. 2 shows the circuit arrangement at the despatcher's office and at the way-station. When properly adjusted this selector has given satisfactory service. It, however, requires one minute to call the thirtieth station.

The third class, or step-by-step selector, is probably the simplest and quickest. It consists of two electromagnets connected in series and mounted in a brass frame. Each magnet is equipped with two

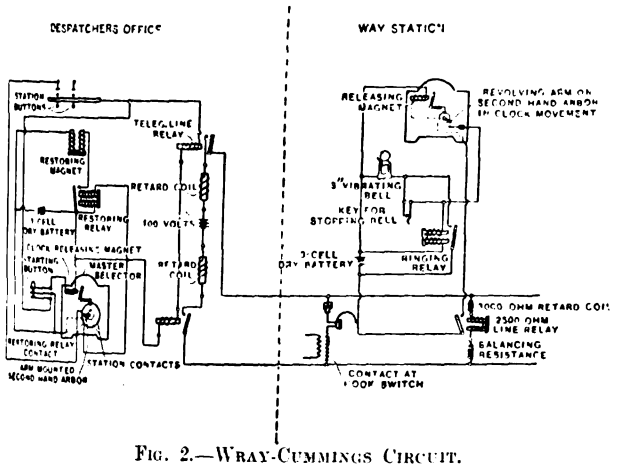

FIG. 2.—WRAY-CUMMINGS CIRCUIT.

spools, the cores of one of the magnets being covered with copper sleeves to produce slow action. Upon the fast-acting lever is mounted a stepping pawl, A, designed to engage with a ratchet wheel to which is fastened a platinum pointed arm (Fig. 3). Mounted on the framework is a retaining pawl, B, designed to retain the teeth as they are stepped. Attached to the slow-acting armature are two fingers designed to engage with the two pawls in such a way that when in the normal position of the slow-acting armature, the two pawls will be held out of engagement with the wheel, while in the operated position the fingers will permit the pawls to engage with the wheel. This selector is operated by first placing on the line an impulse of current which operates both magnets. There is then placed on the line a succession of short impulses, which cause the stepping magnet to oscillate back and forth and step the wheel around the desired number of steps. The speed with which these impulses are placed upon the line, however, does not permit of the slow-acting magnet releasing. When the desired number of steps are taken, the contact is made and current is held on the line, thus ringing the bell. As soon as current is removed from the line the slow-acting magnet releases, which raises the pawls and permits the wheel to fall back to normal position under the influence of its retractile spring.

The foregoing description covers in general the means used by the despatcher for signalling the various stations. The tower operator, when he wants to communicate with the despatcher, listens in to learn whether the line is busy, and if it is not, he merely says "despatcher" in the transmitter. The despatcher wears a head receiver and central office type of chest transmitter, and is on the line all the time.

At first, with the instruments used, the joint impedance of the parallel paths was very low and the transmission correspondingly difficult between widely separated stations. The first step towards overcoming this difficulty was to raise the impedance of the talking bridge by the use of a different induction coil, wound with a low primary and a high impedance secondary. This bettered matters somewhat as the higher resistance bridges produced a more even distribution of the talking current from the despatcher's office, and would give better outgoing transmission from the sub-stations. Although the despatcher's voice currents were undoubtedly better distributed among the bridges with this arrangement, still, due to the fact that the bulk of the impedance in the bridges was in the secondary of the coil, the transmission gain was very slight.

The next obvious step was to maintain the high impedance in the talking bridge, but put as much of this impedance as possible in the receiver. If this were done, however, the high impedance receiver in series with the secondary of the induction coil would reduce the outgoing transmission from the sub-station to an objectionable extent. It was then determined that the best results, both for receiving and transmitting, would be obtained by installing a switching arrangement at the sub-station so that when the switch was in one position the circuit was in the best possible condition for receiving, and when in the other position was in the best possible condition for transmitting. The circuit developed is shown in Fig. 4, the circuit to the left representing the despatcher's station and to the right the way station.

It will be noted that a non-locking push button is located at the way station and in its normal position the bridge across the line consists merely of a 700-ohm receiver and a 1 mfd. condenser. The impedance of this receiver is about 2,500 ohms, and as the total impedance of the bridge is all in the receiver it is all effective for receiving purposes.

When the operator wishes to talk he depresses the push button or in some cases a foot switch which closes his local transmitter

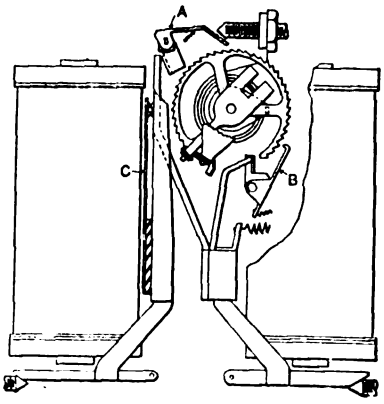

FIG. 3.—LEVER MOVEMENTS OF W. E. SELECTOR.

battery circuit and also connects the secondary of his induction coil to the line. The voice currents generated in the secondary have a path directly across the line in series with the condenser and also a shunt path through the retardation coil and receiver in series. This retardation coil is of about 6,000 ohms impedance, and is placed in series with the receiver in the manner shown, in order that the despatcher may break in if it is necessary for him to interrupt an operator while talking. The impedance values are such that the amount of side tone is just sufficient for the operator to distinguish the despatcher's voice if he interrupts, and he will release his button in order to understand clearly what the despatcher is saying. The outgoing transmission of this circuit is, therefore, the best possible consistent with the fact that we must arrange to permit the despatcher to interrupt the operator's conversation when necessary. The induction coil used in the way-station and also the transmitter are especially designed for railway work. The transmitter button is of medium resistance, and while not taking excessive battery current still varies the current through a large range and gives good volume and articulation with a battery of three cells.

When the receiver is off the hook, this circuit reduces the transmission by about one mile of cable for stations beyond that are receiving from the despatcher. 130 miles (209 km.) No. 9 copper being the average length of despatcher's line, the line transmission loss at 16 miles of wire to one mile of cable will be eight miles of cable, leaving an equivalent in transmission of 22 miles of cable that can be used in the bridges before we reach 30-mile transmission for the last station. Thus it will be seen that on a line of this kind 22 operators can be listening in and good transmission can be maintained. It is practically never necessary that this number be on the line, 15 being a liberal estimate of the number of receivers that will be off the hook at one time. If, however, emergencies should arise

Digitized by Google

making it necessary for 25 or 30 operators to listen in, transmission will be sufficiently good for the transaction of business, even though it is beyond the 30-mile limit.

The requirements of the despatcher's circuit are somewhat different from those at the towers. He must be on the line all the time, and the transmission and receiving of his set must be as good as possible, without resorting to the use of a push-button for talking and listening, as his time is too fully occupied to permit him to use this device.

The circuit is shown at the left of Fig. 4. A 70-ohm receiver is used in series with the secondary of the same type of induction coil, as is used at the sub-stations, and a 1 mfd. condenser in series. The

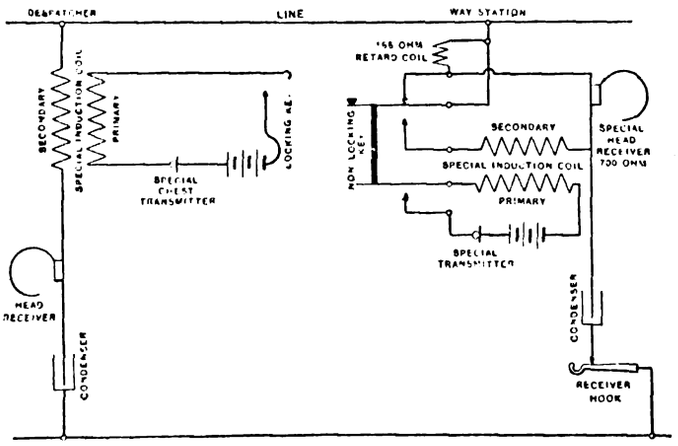

Fig. 4.—W. E. Train Despatching Wayside Station Circuit.

impedance of this bridge is about 650 ohms, and it being the lowest on the line, the receiving will be good. This value also permits good transmitting. The switch shown in the figure is of the locking type and opens the battery circuit when the set is not in use.

CORRESPONDENCE.

THE NOMENCLATURE OF PRIMARY AND SECONDARY SOURCES OF LIGHT.

TO THE EDITOR OF THE ELECTRICIAN.

Sir: I may have made a slip, as Mr. Murphy suggests, in my letter on page 384, where I stated that "one candle-power is therefore the luminous flux per steradian"; but I do not propose to plead guilty unconditionally. I was endeavouring to contrast the simple vector magnitudes which I prefer, with the flux magnitudes which I consider, in general, to contain redundant dimensions. For definitions of the flux magnitudes I turned to American writers, for not only in photometric work but in magnetic work it is common in America to use flux quantities, the magnetic line being seldom used.

I endeavoured to boil down the definitions of the Progress Report* of the Sub-Committee of the Illuminating Engineering Society of New York, submitted at the Baltimore Convention on Oct. 24, 1910, signed by A. Blondel, A. E. Kennelly, E. L. Nichols, E. B. Rosa, and C. H. Sharp, and if I have misrepresented it in the expression "one candle-power is therefore the luminous flux per steradian," I acknowledge my error, but I share my guilt with, at all events, one member of that Committee, and him I propose to incriminate. In a Paper by Dr. E. B. Rosa on Photometric Units and Nomenclature, "Bulletin" of the Bureau of Standards, Washington, Vol. VI., No. 4, I find these words: "I is called the *intensity of the source*, and is equal to the flux per unit of solid angle." I borrowed the unfamiliar term "steradian" from another American source.

Some people might argue that the coulomb is the essential and fundamental magnitude, and that current is a derived one. A certain lamp may be said to take 1,800 coulombs per hour. Other people would say, you have a redundant dimension, why not say that the lamp takes a current of half an ampere? I will not say that that would suit English ideas, nor, seeing with whom I am in controversy, British ideas, but it would, I think, suit most English-speaking people. On the other hand, an accurate Frenchman would object. To a Frenchman "current" is a phenomenon; an ampere is not the unit of current, but it is a physical quantity and is the unit of intensity of current. The genius of the French language is a serious matter, which must be respected. Prof. Blondel abhors "candle-power." If it will conduce to simplicity and accuracy, I will try to abandon the use of the expression candle-power, and follow the American committee in using "candle" as the unit; but it will be difficult.

I disagree with Mr. Murphy's proposed nomenclature.—I am, &c.,

London, July 8. A. P. Trotter.

CHEAPENING SERVICES FOR ELECTRICITY SUPPLY.

TO THE EDITOR OF THE ELECTRICIAN.

Sir: The article by Mr. W. A. Vignoles in your issue of the 23rd is an interesting contribution to a branch of the mains engineer's work which is of growing importance in view of the enormous number of small connections which are likely to be made to existing networks in the near future. I hope that the following observations may induce others interested in the subject to contribute some items of experience or expressions of opinion.

The writer points out the difficulty of charging for service cable on private property in view of the fact that the gas suppliers seldom make any charge, and in many instances will completely pipe new buildings free if there is risk of electricity being introduced. I would suggest that the usual limit of 40 ft. to 60 ft. of free service cable might be increased now that the cost of service cable is being reduced by a natural fall in prices, and by the fact that the average service cable need not be so heavy as formerly.

It would appear preferable to increase the limit of free distance rather than reduce the charges which are made for cables beyond that distance, so reducing the number of cases where a few feet have to be paid for. Consumers who have not absolutely decided to use electricity are sometimes discouraged in this way, failing to realise how small is the importance of the charge made in comparison with the value of the supply to them.

It is also bad policy to insist upon meters being placed in the nearest position to the mains, which may be, and often is, an inconvenient one to the consumer, who feels that he is entitled to the free 20 yds., or whatever the limit may be, and is annoyed to find that, whilst he is nearer to the service cable than some of his neighbours, the suppliers begrudge the expenditure upon a few yards of cable in order to meet his convenience, whilst in other cases they are obliged to give it by reason of their own bye-laws.

With regard to fuse boxes for lighting and heating, the practice of using two fuses and one solid link, or one heavier fuse in place of two-way double-pole boxes, is increasing, and appears to be entirely satisfactory, whilst reducing cost.

The connection fittings in boxes and cut-outs for tailing the outer conductors of concentric cables have always been a source of some trouble, and many ingenious mechanical devices have been produced. It is doubtful, however, whether any mechanical connection is advisable when buried in insulating compound.

On large cables the concentric cone connectors can be made so massive that when properly tightened up the outer conductors are more or less crushed into the metal of the connector, and thus a permanent connection results; but where small fittings are used, or where the position makes it difficult to screw them up, trouble is likely to arise owing to the compound slowly insinuating itself between the conductor and the connector. This may take a considerable time, but in the end bad connection and heating will often result, so that, speaking generally, it appears doubtful if soldering soundly carried out can be improved upon for buried work.

Digitized by Google

The use of twin and multi-core cable greatly simplifies mains work and tends to reduce faults.

The writer's statement that the extra cost of service cable, twin over concentric, is 1d. per yard, I venture to suggest may be intended for 1d. per *foot*, that amount more nearly representing 10 per cent. on the cost of the average service cable, unless reference is intended to a cheap and possibly unarmoured type.

Lamp-post services when made upon large existing distributors do appear costly in comparison with their importance, but there can be no doubt that it is a grave mistake to spare expense in making them thoroughly, owing to the importance of the other connections on the distributor, the strongest link of which may easily be the least of the lamp-post services attached to it.

Where the posts served are very close to the distributing cable a simple connection may be made by running twin rubber-insulated lead-covered cable out of the tee-box and in troughing of the "Howard" type directly up the post to the lamp switch, without further joints, the troughing being made to enter the tee gland of the joint box at the one end and to enter the base of the lamp-post at the other, the whole being made solid with compound and covered with bricks, or asphalted over in the manner directed by the makers of the troughing.

The looping of services is a very useful method of lowering the average cost of connection. Precautions are necessary to prevent the spread of fire through any holes or tubes put into party walls for cables, and this should be seen to, as fire insurance policies frequently contain a clause with reference to cutting party walls.

The chief objections to the device appear to be that in some cases service cable which is directly connected to the mains network without fuses may run for some distance under floors of private premises, and also that a fault occurring at the loop-in-point at one house would interfere with the supply of the next or further houses connected to it, and might, if the first house were closed, be somewhat difficult to deal with.

It is not usually difficult, as the writer states, to obtain permission to make these subsidiary connections on private property, but one is always apt to have trouble subsequently if the property is divided and falls into different hands, and where it can be arranged it is more satisfactory and safe to run separate cables to each consumer beyond the nearest point in the road over which the public authority has control.—I am, &c.,

Tunbridge Wells, July 8. J. W. BEAUCHAMP.

EXPERIMENTS IN IMPACT EXCITATION.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: I have read with great interest Mr. G. W. Nasmyth's article which appeared in your issues of June 16th and 30th, and perhaps I may be allowed, as an engineer under the late Lepel Syndicate, to make a few comments in your columns.

One cannot read Mr. Nasmyth's article without highly appreciating the care and patience with which he has carried out his tests, under conditions familiar to the writer as being far from the ideal for quantitative measurements. It is, therefore, a matter for regret that the experimenter, like others, seems to have been uninformed as to the conditions which obtain in the everyday working of a Lepel station. Nevertheless, the information compiled has great scientific interest, and in many cases bears directly upon station conditions. But it is disappointing that these experiments were not carried out wholly under these latter conditions, when perhaps some light might have been thrown upon other problems which still await definite solution.

It is by no means an uncommon error to assume that the gap is, in itself, the one primary factor in the production of highly damped impulses, and that the constants of the shunt circuit are of almost secondary importance. This is by no means the case. Efficient spark quenching is greatly dependent upon these values, in addition to which the radiating properties of the antenna play an important part. And in this latter connection it must be mentioned that Mr. Nasmyth's account shows no evidence of radiation being represented, either by the introduction of an antenna or the substitution of adequate secondary resistance.

Now it is perfectly feasible that a Lepel generator circuit fed by such currents, and including the inductance and capacity values employed by Mr. Nasmyth, should have produced forced undamped oscillations as distinct from the free oscillations produced in actual practice by Lepel stations; provided, of course, that the proper relation existed between the oscillation constants, and especially when relieved from its normal load, a radiating antenna. But, in order to show the wide variance between Mr. Nasmyth's arrangements and those most favourable to "impact excitation," may I be allowed briefly to discuss the latter?

Prof. Wien advocated the employment of a highly damped spark whose period of activity should last only until the associated antenna might have built up its maximum intensity. At that instant the primary spark was to be completely quenched and the antenna left to oscillate free from the reaction of the primary. Now all conditions in the transmitter must contribute in order to achieve this object.

With regard to the spark-gap, the rapid cooling of the electrode surfaces and the short distance between them, the hermetical sealing of this space containing the hydrogenous atmosphere produced by the paper, and multiplication of the gaps, all serve rapidly to de-ionise the gap after disruption.

In the second place the antenna must rapidly and completely absorb the energy of the primary circuit and efficiently radiate this into the surrounding medium. A tight coupling and good radiation properties are, therefore, essential.

And, perhaps most important of all, in order to give the necessary "dead beat" characteristics to the primary oscillations, the ratio of primary capacity to primary inductance must be as great as is practicable. Primary inductance must be reduced to as low a value as is consistent with tight coupling, and capacity increased to the utmost limit, defined only by the value when the act of closing the feed circuit fails to "start" the generator.

Moreover, reverting to the gap, the spark group frequency must be kept low in order to give the cooling arrangements there a fair opportunity of performing their work.

An estimate of the capacity range which would have enabled Mr. Nasmyth to cover the same ground with his circuit arranged for the best quenching effects may be taken as 0·02 mfd. to 0·25 mfd., and the primary inductance of 14,300 cm. was many times too large.

A probable reason for the non-employment of capacities of the above order is obviously that large high frequency condensers do not form part of an ordinary laboratory's equipment; and it is possible that this may alone account for many existing misconceptions as to the functions of these generators.

Turning to the article itself, I should like to draw attention to Fig. 6. If the two curves, "Lepel arc with oscillations" and "Lepel arc without oscillations," are compared, the influence of a secondary load upon the primary characteristics is clearly indicated, and this will bear out my plea for an antenna or representative resistance.

And it must be admitted, after study of Fig. 7, that increasing oscillation intensity as the feed current is reduced is clearly shown by the rising tendency of the whole family of curves. Is not this ample demonstration that, with the capacities employed, maximum intensities (*i.e.*, "working conditions") lie in the unexplored region of smaller current values, or, conversely, that larger capacities were required for the current values used?

The marked affinity, disclosed by Mr. Nasmyth, between the characteristics of an uncoupled Lepel gap, shunted by large inductance and small capacity and fed by a large current, and those of the Poulsen arc, have much interest; and the exhaustive examination of the change of frequency with feed current should prove of great value. Moreover, in conclusion, I, for one, should welcome a later account of the same experimenter's further researches on the Lepel generator under "station conditions."—I am, &c.,

London, July 10. F. J. CHAMBERS.

UNDERLOADED THREE-PHASE INDUCTION MOTORS.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: In an article in your Mining Issue of May 12th a contributor refers to the fact that, after a mine has been equipped with electric drives, it is often found that many of the motors are very considerably underloaded, and that, as a result of the bad power factor following upon this, trouble is encountered in dealing with the wattless current the generator is called upon to supply. The article attributes this mainly to a desire to limit the number of different ratings in the motors employed.

In my own experience the choice of a much too large size has been generally due to the estimate of the necessary output having passed through the hands of several different persons, none of whom has had the pluck to back his real opinion. The consequence is that each successive estimator has taken his predecessor's figures and multiplied them by a factor which he calls a factor of safety, but which I think might be better termed a "*factor of timidity*." If many nervous people have a hand in the matter it is very easy to get a 50 H.P. motor where one of 15 would do the work.

At the same time, it must not be overlooked that cases often arise where, though the immediate demand is 15 H.P., an expected increase in the future output may make it advisable to put in at once a 50 H.P. motor.

Whatever may be the reason, it often happens, as your contributor says, that motors are found to be very considerably underloaded, and a bad power factor results.

To deal with the difficulty he suggests the purchase of smaller motors or of over-excited synchronous machinery, where this can be supplied.

It seems possible to me, therefore, that it is not generally known in England that there sometimes exists another way, which has the advantage of not adding to the capital expenditure. If the underloaded motors happen to be mesh-connected and very considerably underloaded, as in some of the cases he quotes, the alteration of the terminal connections to star will generally have the effect of greatly improving the power factor of the existing motors, usually to the benefit also of their efficiency.

This alteration really amounts to converting the motors into others which can only give, as maxima, torques equal to about one-third of the maximum torques of the original motors. The construction of the Heyland diagram for each case will at once make this plain.—I am, &c.,

Johannesburg, June 17. H. J. S. HEATHER.

FARADAY SOCIETY.

At the meeting held on June 13 at the Institution of Electrical Engineers, Victoria Embankment, Mr. G. T. BEILBY, F.R.S., in the chair, Prof. ERNST COHEN, of the University of Utrecht, delivered a lecture on—

"Allotropic Forms of Metals."

The property of a chemical element to occur in different modifications is called allotropy, a word introduced into chemistry by Berzelius in 1841. Only a few elements were presumed to show allotropy, but the researches of the last few years make it probable that all elements show it. We have to seek for the conditions which enable them to take different forms. The lecturer pointed out that the conceptions which the physical chemistry of the last quarter of a century has brought us enable us to bring allotropy under the head of equilibrium phenomena.

He discussed enantiotropy, monotropy, and dynamical allotropy, and outlined the results of some of the investigations carried out in these directions by himself and his collaborators, Prof. Katsuji Inouye and Drs. Collins, van Eyk, Goldschmidt, Kröner, Olie and Strengers, during the last twelve years.

As a striking illustration of enantiotropy, he referred to the transformation of tin into a grey form (*tinpest*), a phenomenon that has great importance for the technical use of this metal, seeing that the transition point between the white and grey forms is at 18°C., and that below that temperature all ordinary tin is in a metastable condition. Some striking examples of the gradual transformation that had taken place in old tin vessels were exhibited, and the phenomenon of "infection" was likewise discussed.

Monotropy was illustrated by the consideration of "explosive antimony," a mysterious form of antimony discovered in 1854 by Dr. Gore, of Birmingham, and prepared by electro-deposition from the haloid solutions of the metal. Unlike in the case of tin, there is here no transition equilibrium temperature; at every temperature the metastable form of antimony changes to the stable form, becoming therefore less and less explosive as time goes on.

As typical cases of dynamic allotropy, white and violet phosphorus, as well as tellurium, were cited, although the researches on the latter element are still going on in the lecturer's laboratory.

Prof. J. A. EWING asked whether there was any connection between the slow process of recrystallisation that went on in metals after strain and the phenomena described in the lecture.

Dr. W. ROSENHAIN referred to the allotropic forms of iron known as α, β, and γ iron. It might be that the β form was a case of dynamic allotropy, and there was a possibility of mutual solution of the two forms within certain limits of temperature. The "infectious" nature of "tinpest" was of great interest and importance; analogous phenomena were to be found in the case of severely-strained steel and in other instances. The volume-changes accompanied by disintegration that took place in some of the aluminium alloys were probably to be ascribed to allotropy.

Prof. T. TURNER likewise drew attention to the possibility of allotropic forms existing in other metals, such as lead and zinc.

Mr. J. W. HINCHLEY said it would be of great interest to know whether there were any retarding agents that would prevent the metastable from passing to the stable states. He thought that lead acted in this way towards tin.

Mr. G. T. HOLLOWAY asked whether tin could be prepared so pure that "infection" would not take place in it.

Mr. W. R. BOUSFIELD remarked that spongy platinum deposited from a chloride solution containing only $\frac{1}{40}$ per cent. of lead was black and velvety. This might possibly be an allotropic form. He thought that in the case of antimony one did not have allotropy but a solid solution of minute quantities of chloride in the body of the metal.

Dr. H. BORNS believed that foreign substances had been found in the explosive form of antimony.

Dr. E. FEILMANN referred to the mysterious giving way of lead sheet in acid chambers, which might be due to allotropy.

Prof. E. COHEN replied briefly to the discussion. He did not think the recrystallisation referred to by Prof. Ewing had anything to do with allotropy. Replying to Mr. Holloway, he had experimented with tin containing only $\frac{1}{100}$ per cent. impurities. He could not answer Mr. Bousfield's question. The two forms might merely be different states of division, but he would look into the matter. Replying to Dr. Borns, there were always traces of the acid of the solution from which it was deposited in explosive antimony. It was often overlooked that electro-deposited substances almost always contained traces of the solution mechanically enclosed.

METROPOLITAN ASSOCIATION OF ELECTRIC TRAMWAY MANAGERS.

A meeting of the members of this Association was held on the 5th inst., at the offices of the London United Tramways (Ltd.), High-road, Chiswick, W., when there were present:—Messrs. A. H. Stanley (managing director, London Electric Railways and London United Tramways), chairman of the Association, A. Coveney (Erith), C. Mittelhausen (Bexley Heath), F. Schofield (Leyton), W. C. Ullmann (East Ham), W. Murray (Walthamstow), A. Balfour (Dartford), W. E. Hammond and A. H. Pott (Metropolitan Electric Tramways), A. V. Mason (South Metropolitan Tramways), and T. B. Goodyer (Croydon), hon. secretary. Apologies for absence were received from Messrs. H. E. Blain (West Ham), H. Howard (Barking), and A. De Turckheim (secretary, Tramways and Light Railways Association).

The party travelled in the company's parlour car to Isleworth, where they inspected, and were much interested in, the Falk system of rail welding, which is now being extensively carried on. On returning to the Chiswick depot, and after tea was partaken of, a business meeting was held, and various matters discussed, the hon. secretary being requested to give effect to the same on the lines expressed. Following an inspection of the repair shops and car sheds, and in respect of which information on many points of interest was kindly given by Messrs. Knapp and Rozier, the party journeyed to Hammersmith, and entrained for Earl's Court station, where they were afforded the opportunity of inspecting the work in progress in connection with the movable staircase which is being constructed for the London Electric Railways. After an amount of careful stepping and ladder climbing, and *terra firma* being safely reached by all, the party proceeded to the Welcome Club at the Earl's Court Exhibition, where they were kindly entertained to dinner by Mr. Stanley, and where also, they were joined by M. James Devonshire, managing director of the Metropolitan Electric Tramways.

In expressing his regret at not being able to join the party earlier, and proposing a hearty vote of thanks to Mr. Stanley for his hospitality in entertaining the members to dinner, and whose great kindness to the Association is so much appreciated, Mr. Devonshire stated, that the visits of inspection which had been so kindly afforded that afternoon, could

Digitized by Google

only result in much good to the members, and the respective tramway systems they managed. Thanks, also, were due to Messrs. Knapp and Rozier, for the ready assistance and information they afforded.

General regret was expressed at the absence of Mr. Blain, it being the first occasion, since the formation of the Association some years ago, that he had been absent.

Mr. STANLEY, in replying, stated he was always glad to meet the members of the Association, and hoped they might profit from the inspection that had been made. He understood that that was the last meeting at which they would have the pleasure of having Mr. Balfour (Dartford) with them, he having accepted another appointment, and he desired to convey, on behalf of the members, their hearty good wishes for his future success.

Under the guidance of Messrs. Knapp and Rozier, the party subsequently made a tour of the Exhibition.

A NEW CURRENT GAUGE.

Although the portable ammeter is a handy form of instrument it is apt to be expensive. On networks and large installations it is often useful to be able to ascertain the current in a particular feeder or cable under certain conditions of load. In such cases a portable

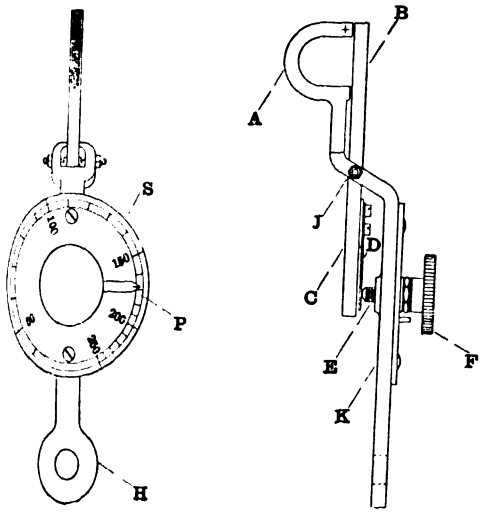

FIG. 1.—DRAKE & GORHAM CURRENT GAUGE (FRISBY'S PATENT).

instrument can only be connected in circuit with some loss of time and difficulty. Messrs. Drake & Gorham are putting on the market a portable current gauge (Frisby's patent) which need only be

FIG. 2.—DRAKE & GORHAM CURRENT GAUGE IN USE AT FEEDER PILLAR.

clipped on to a cable and a small adjusting screw turned to obtain a fairly accurate register of the amount of current passing. Details of the device are shown in Fig. 1, which illustrates plan and side views. It will be seen that it comprises a U-shaped magnet A at the end of a long arm K, and an arrangement whereby a centrally pivotted armature B can be adjusted in respect to the poles of the magnet. This consists of an adjustment screw E, which is turned by a large milled head F, there being a pointer P under the head which moves over a disc S graduated to read in amperes. An eyelet H is provided for hanging up the gauge. In actual use the U-shaped magnet is passed round the cable, and the armature pressed against the poles to which it will adhere by reason of the attraction set up by the current passing through the cable. D is a stiff spring on the armature against which the adjustment screw rests, and this screw is turned round until the armature is forced away from the poles. When this has been done, the reading on the scale under the pointer shows the approximate current. Fig. 2 shows how the device can be used over the fuses in a feeder pillar to obtain a reading of the current passing. The instrument is made at present to read up to 250 amperes, but larger sizes are in preparation.

OLYMPIA ELECTRICAL EXHIBITION.

The following revised preliminary list of exhibitors at this exhibition, which will be held at Olympia (London, W.) between Sept. 23 and Oct. 21 next, has been issued by the organisers:—

	STAND NO.
Abbey Electric Co.	5
Adams Manufacturing Co.	107, 108
Aerators, Ltd.	77
Alexander, Geo. H.	295
Allen & Simmonds	229
Armorduct Manufacturing Co.	120, 121, 138, 139
Aster Engineering Co.	243
Auto Recorder Co.	228
Barker (John) & Co. (Kennedy Bending Machine)	280
Bastian Electric Heating Synd.	173, 190
Bastian Meter Co.	173, 190
Bat Meter Co.	83
Bell, Heslop	276
Benjamin Electric (Ltd.)	151
Bennis (E.) & Co.	200, 215
Berry Construction Co.	30, 31
Berry, Skinner & Co.	129, 130
Bonella (D. H.) & Son	198, 217
Boosey (W. E.) & Co. (Trident Co.)	281
Braun & Co.	259
Bristol Co.	3
British Aluminium Co.	266
British Electric Transformer Co.	30, 31
British Metal Engraving Co.	261
British Prometheus Co.	197, 218
British Thomson-Houston Co.	124, 135
British Vacuum Cleaner Co.	174, 189
Brook, E.	245
Brook, Hirst & Co.	153
Bruce Peebles & Co.	119, 140
Brunner, Mond & Co.	260
Brush Electrical Engineering Co.	84, 89
Buckton (Joshua) & Co.	122, 137
Bullers Ltd.	118, 141
Burton (C. W.), Griffiths & Co.	205, 210
Callender's Cable & Construction Co.	196, 219
Cassier (Louis) Co.	282
Cateaux (J. L.) & Co.	23, 38
Chamberlain & Hookham	156, 157
Churchill (Chas.) & Co.	85, 88
Concordia Electric Wire Co.	270
Consolidated Pneumatic Tool Co.	50, 73
Corona Lamp Works Co.	244
Coventry Chain Co.	251
Credenda Conduit Co.	156, 157
Crypto Electrical Co.	57
Dorman & Smith	59, 64
Dowsing Radiant Heat Co.	161
Drake & Gorham	61, 62
Duerdill (J.) & Co.	238
Dussek Bitumen Co.	242
Eastman & Son	236
Eastman & Warne	236
Ebonestos Manufacturing Co.	226
Edison & Swan United Electric Light Co.	15, 16, 45, 46, 98, 117
Efandem Co.	4
Electric Ordnance & Accessories Co.	80, 92
Electrical Apparatus	24, 37
THE ELECTRICIAN	180

The managers direct special attention to Rule 5, as follows :—

"Exhibitors, the nature of whose displays necessitates their showing goods of other manufacturers, agree not to advertise such makers' names either upon the article shown or upon their stands, unless such goods are manufactured by a fellow-exhibiting firm or are specified on the space contract. Any contravention of this rule will render the offending exhibitor liable for any damage that the Committee or the management may incur."

LEGAL INTELLIGENCE.

National Telephone Co. v. Postmaster-General.

The Railway and Canal Commission (Mr. Justice A. T. Lawrence, the Hon. A. E. Gathorne-Hardy, and Sir James Woodhouse) on Friday continued the hearing of this case.

Mr. F. Gill was re-examined by Mr. Danckwerts. Referring to the fire at the Bank exchange some years ago, caused by the switching on of the current on the District Railway, he said that there was no fuse at the time; the work had not been finished, and the men had not completed the work of moving the telephone cables. The railway company turned the current on as a result of a misunderstanding, and he thought he was right in saying that they accepted the liability and paid the damage caused. The telephone company especially protected circuits in close proximity to power wires and rails. It was effected by an adequate system of fuses. In the case of overhead wire there were two ways of protecting the telephones. The first to make it so that the telephone wires could not come down on the bare tram or electric power wire, and in the second place to prevent such an occurrence by means of fuses, so that if they did come in contact there would be no danger. There was really no danger in the face of these precautions in erecting telephone or telegraph wire near overhead power systems; in fact, the P.O. had taken compulsory powers to attach their telephone and telegraph wires to the trolley poles of the tramway and electric railway systems. There are advantages in overhead wires for telephone work, chiefly on account of clearness in transmission. He was referring to open cables. The audibility was not affected by reason of the cable being underground.

Mr. Wm. Cook, assistant engineer-in-chief of the National Telephone Co., said he recollected no case of trouble arising owing to an electric power cable coming into contact with a telephone wire except the instance of the Bank exchange. A number of the company's lines were laid in proximity to electric railways, but no trouble ever arose. In the notices of rejection given by the P.O. against lines laid along electric railways, there was no mention of tramways or light railways. As a matter of fact, he said, there were numerous lines or cables near electric tramways. Where the wires were bare wires carried on the trolley poles of a tramway or light railway it was not only protected in itself but there was a Board of Trade regulation that the tramway or light railway company should guard its wires from any contact with the telephone wires. He could only remember one case of fire originating from telephone wires falling on trolley wires and that was at Liverpool. The dangers of accident from plant laid along an electric railway was no greater than from that laid along an electric tramway or light railway. His company had 7,235 miles of circuit along the City & South London Electric Railway; between Westminster Station and the L.C.C. subway 2,667; and between the Borough and London Bridge 3,138. The crossing over or lying along an electric railway, he thought, was possibly less dangerous than crossing or passing along tramways or light railways. The lines laid along or near railway lines were suitable for the Post Office telephone service. He said that every call was responded to in an average of 5·5 seconds, and he should be greatly surprised if the Post Office could equal that. He thought it was possible that the carriage of cables and wires along underground tunnels could be carried to excess, and the P.O., he thought, was doing so. They were giving notice to "scrap" much material which would be useful to the P.O., some of it immediately, and other parts that merely wanted a little adaptation. There seemed no doubt to witness that the laying of lines along electric railways was quite safe if every possible precaution was taken to prevent the contact of the telephone wire with cables carrying current of higher tension.

Mr. H. F. Parshall, D.Sc., gave evidence in support of the company's contention that any part of their works and plant adaptable to the service of the P.O. should be taken over and compensated for. He thought it would be quite wrong to scrap things which could by any means be made useful.

Mr. S. Z. de Ferranti, President of the Institution of Electrical Engineers, expressed the opinion that the most economical way and the most efficient way of taking over the work of the company would be on a purely engineering basis, and, he thought, that should be done by a process of gradual absorption of the exchanges and works of the company. He admitted that much of the plant objected to could not be profitably taken over by the P.O., but contended, from his examination of several rejected and other exchanges, that much of the material in those exchanges could be profitably taken over by the P.O. He confirmed the view that there was a certain percentage of the plant in all the condemned exchanges which might be made useful by the P.O. and should not be rejected.

Sir Alex. B. W. Kennedy, consulting engineer, said he had listened to all the evidence in the case. There was some part of the condemned plant with which the P.O. could not dispense. From his experience he gave illustrations of the difficulty of effecting even comparatively small changes in electrical distribution, although the change was effected very gradually, and from that deduced that a great disturbance would be effected if the P.O. suddenly took over all the company's business in one day.

In answer to the Attorney-General, Witness said there was no difficulty in connecting the wires to one exchange and disconnecting them from another.

Mr. Justice Lawrence asked Mr. Danckwerts what was the position of the Company in the matter?

Mr. Danckwerts said the Company would ask the Court to say that the whole of the notices of the P.M.G. covered suitable plant and none of the exchanges of the Company should be condemned.

Mr. Justice Lawrence: We are in a difficulty. It seems to me that until we know what the Post Office scheme is, it is impossible for us to come to a conclusion upon the matter. You are rather putting the cart before the horse.

The Attorney-General said, unfortunately, they had decided to put the cart before the horse when the case started.

His Lordship said he did not think the Attorney-General should delay in bringing the case for the Post Office before the Court at the earliest possible moment.

Sir Jas. Woodhouse said, in his opinion, private wires must be taken over as a whole on the terms of the agreement—that was so far as they were suitable for the actual requirements of the Post Office service.

The Attorney-General said he had objected to the contention that if a cable contained one private wire and 599 other wires the Post Office must take over the whole cable whether the 599 other wires were good or bad. If he would meet the difficulty the P.M.G. was prepared to pay for the private wire or its value or such wires in a cable as were good. But the only thing the Court had to deal with, he submitted, was whether the plant objected to was suitable for the P.O. service or not. The Court could not say that a cable with one good wire and 99 bad ones was a cable suitable for the Post Office service.

Witness said it was not possible to separate good cables from bad ones. There was no question of unsuitability.

Mr. Hammond V. Hayes, of Cambridge and Boston, Mass., U.S.A., said he was employed by the Bell Telephone Co. in 1895, and until 1907 carried out their experimental work and scientific investigation. In 1902 witness was appointed assistant chief engineer to the American Telegraph & Telephone Co., and he held that position until July, 1907. He was responsible largely for the types and styles of equipment to be employed by the telephone companies in America using the Bell system. Since 1907 he had been in private practice, but he still retained connection with the American company as general expert. With regard to the system adopted in America, witness said they began with an overhead system, but telephony had developed to such an extent in the United States that in the centres of the large cities they had had to put their cables underground. From the centres the cables extended outwards in main arteries laid underground, and then emerged for distribution purposes to aerial cables, running along the sides of houses, the fencings of buildings, &c. In this manner, while some of the system was underground a very large proportion of it was overhead. There was no difficulty in working that combination of underground cables with overhead wires. They considered it a standard system and there were very few places in America where it did not prevail. They preferred it on account of its cheapness. Their overhead system was very similar to the method of construction here. His company had about £6,000,000 invested in overhead lead-covered cables. That figure did not include the cost of poles, &c., supporting those cables. A completely underground distributing system was a rarity in the United States of America. In regard to the common battery and magneto systems, witness said that in America the number of switchboards with local battery installations were diminishing in the large and crowded areas; in fact in such areas the local battery exchange had practically ceased to exist. That was due to the large increase in the number of subscribers, and the economy of time which might be effected in operation under the central battery system. It was really brought about by the necessity of putting in large switchboards in the place of old

Digitized by Google

ones in the big exchanges. When that was done they, of course, installed the common battery switchboard. They had never scrapped any serviceable apparatus. He might say that within the last five years there had been more local battery apparatus manufactured and installed in the telephone service than ever before, even in the days when the local battery was the only system in use. The reason of that was that the business of telephony had developed in the outlying small towns and areas to such an extent that they not only needed all the local battery apparatus which they set free from the large exchanges to supply those small towns, but they also had need to manufacture a great deal more of it. In the small offices they used the local battery system practically exclusively. Of course, apparatus out of date or not serviceable through wear was scrapped but they had regulated their changes from the local battery to the common battery system in the large exchanges, so as to set free the local apparatus as it was wanted in the country districts. The switchboards had been in service for years. The majority of the local battery switchboards had had to be replaced because they had become too small to meet the demands of business pressure, and they had had to be replaced before they were worn out. In such cases they were used at small stations.

Mr. MORTON: Do you think it economical to effect a substitution from the local battery system to the common battery system in the London exchanges at one time rather than to do it gradually?

The ATTORNEY-GENERAL submitted that that was not relevant to the point which the Court had to consider. It was not a question of what was the most economical system.

His LORDSHIP: But is that not one of the elements which we have to take into consideration when deciding a question of suitability? Surely commercial suitability is a thing which comes into the matter?

The ATTORNEY-GENERAL submitted that it was not relative to the consideration of the Court. The question was not what commercial men would do under the circumstances of the amalgamation of two companies. That was an entirely fallacious way of approaching the case before the Court. The only question really was whether the P.M.G. was justified in the opinion he had formed that the plant in question was not suitable for the actual requirements of his service on a certain date.

His LORDSHIP thought that surely the question of economy was one which the P.M.G. must properly take into consideration before making up his mind.

Witness, continuing, said in his opinion, it could be an extremely wasteful and almost wicked thing to scrap apparatus which was useful and could be used in connection with the service simply because it did not happen to be wanted at a particular time.

Counsel was proceeding to question witness with regard to the suitability of telephone lines in the close proximity of high power cables when

The ATTORNEY-GENERAL said he did not propose to contend that that particular objection was one which could be maintained. Subject to the condition that proper precautions for protection were taken, he agreed he did not think the objection could be insisted upon. He would suggest that if any difficulty arose between the parties afterwards as to whether or not any particular cable was properly protected, some engineer agreed upon between both sides should view it and decide the matter. The P.M.G.'s attitude was that he was bound to take precautions to ensure that any plant which he took over was properly and sufficiently safeguarded. If that were done he would not raise any further point about cables or wires laid along, over, &c., electric railway lines and other electric power systems.

Some discussion ensued, and on the suggestion of Sir RUFUS ISAACS the Court decided to make a declaration that all telegraph lines in the proximity of high power cables were suitable, leaving it to the P.M.G. to point out any specific cases which might arise in which he was not satisfied with the precautions taken.

Mr. HAYES, further examined, said that in America they had overhead tramway systems throughout the country, and in connection with their telephone system they had to make frequent crosses over the bare traction wires in order to get their telephone wires from one side of the street to the other, &c. To avoid the risk of contact with the high-voltage traction wires they covered their telephone wires with rubber and their cables where they crossed the traction line were supported in such a way that the possibility of contact was reduced to a minimum. They also had protecting apparatus identical to that used in this country installed in the exchanges and that afforded complete protection against an outside current causing injury to the switchboard or telephone apparatus. He knew of no case where the protective apparatus had failed in its function.

Cross-examined by the ATTORNEY-GENERAL, Witness said that in America they avoided the use of the overhead system for the main arteries in the large cities. He had seen the Avenue exchange, and its system of overhead wires. They had nothing like that in America now, but they had when he began business 22 years ago. There was a city ordinance against the use of overhead cables in the crowded centres of America. For their overhead distributing service they used lead-covered cables for the most part. They also used indiarubber cables, which were quite satisfactory as lead-covered cables for short lengths. He did not agree that the lead casing was for giving greater protection. Their overhead lead-covered cables were identical with the cables used for their underground system and it was interchangeable, the object being to carry the system on practically as a unit as far as it was possible. He did not agree that indiarubber casing for cables deteriorated rapidly in the air from evaporation and chemical action because the indiarubber covering was wrapped round two or three times with another material. (Two papers were here put in by the Attorney-General which had appeared in an English electrical journal. The witness described as "Very highly interesting indeed." He had not himself seen anything quite like them.) He did not agree that rubber-cased cables were more dangerous owing to fire than lead-cased cables. His experience of fires was that in the case of a rubber-covered cable the fire might run a few inches and then go out. There had never been any question raised by the insurance companies with regard to the inflammability of these cables. In the American cities, generally speaking, his company obtained wayleaves and ducts free of charge. The people were only too glad to get the telephone system laid on. All the telephone exchanges in New York were on the common battery principle. They used to be on the local battery system, but they began to be changed about 14 or 15 years ago. He thought the last one was converted about four or five years ago, but the change had been a gradual one. All the telephones in New York were under one company, and there was no competition in the city. So far as he knew the power of the telephone company in New York to carry on its business was unlimited. He could not tell whether they had to apply to the Legislature of New York State for a licence, but he should say that probably throughout all the States of America it was necessary for the telephone company to get a licence from the ruling authority in each State. Taking the affiliated systems of his company, he should say they had about 10,000,000 subscribers' stations.

In answer to his LORDSHIP, Witness said that with regard to spare wires the practice of his company was to put down a cable containing as many wires as they thought there would be subscribers for at a given point. Then canvassers went round to endeavour to get the number of subscribers estimated. Frequently, so energetic were these canvassers, the company had to supplement the cables.

Mr. JAMES SWINBURNE said he did not think it was possible to make a sudden change-over from the Telephone Company's system to that of the P.M.G. It was difficult enough to do it in the case of a large exchange, but when it was proposed to do it in the case of all the exchanges the difficulties were increased enormously. To carry out such a change properly some time must be taken over the process.

The hearing was here adjourned.

On Tuesday there was a consultation which lasted three hours, after which,

The ATTORNEY-GENERAL stated in Court that the parties had agreed upon the form of the declaration to be made. It would not be necessary to trouble the Commissioners with the details, but the Court would be asked to make a declaration in the form agreed by the parties. That would dispose of everything before the Court—everything that had to be dealt with—preparatory to valuation being made at the end of the year. As to the degree of suitability under clause 4 of the purchase agreement, that point was still open to be taken before the Court.

Sir ALFRED CRIPPS said he understood the arrangement was that they should leave clause 4 as it was. It did not affect the agreement.

Mr. Justice A. T. LAWRENCE said he was extremely pleased that they had been able to come to terms. The Court trusted the terms would enable the matter to be worked out upon the valuation without further difficulty. There will be an order in the terms drawn up.

London Electric Supply Corpn. v. Westminster Electric Supply Corpn.

The Court of Appeal on Monday commenced the hearing of this appeal by plaintiffs from a judgment of Mr. Justice Joyce (reported in THE ELECTRICIAN for March 10 and April 14).

The action arose out of a dispute between the two companies as to the construction and effect of an agreement entered into by them relating to the management and working of the Westminster portion of plaintiff's undertaking. Both companies were competing companies, plaintiff company supplying alternating and defendants continuous current. Under the agreement (dated May 4, 1910) which was sanctioned by the Board of Trade, defendant company, for the consideration mentioned, took over the working of plaintiff company's undertaking in the Westminster area until it was purchased by the local authority. Plaintiffs wished to restrain defendants from attempting to induce any consumer in the Westminster area who took alternating current to cease to take same and in lieu thereof to take defendant company's continuous current, and secondly for a declaration that according to the true construction of the agreement, defendants were bound to supply electric energy by means of plaintiff company's alternating current to any consumer in the Westminster area who might apply to plaintiff company for a supply by alternating current. Mr. Justice Joyce held that defendants, by the agreement, purchased the right to work and take the profits of plaintiff's undertaking in the Westminster area, and that there had been no breach by defendants of any of their obligations under the agreement. Hence the present appeal of plaintiffs.

Sir A. Cripps, K.C., Mr. Gore Brown, K.C., and Mr. Austen Cartmell appeared for appellants; and Mr. C. A. Russell, K.C., Mr. Younger, K.C. and Mr. S. Kennedy for respondents.

Sir A. CRIPPS said the sole question in the case was the construction of the agreement. There were formerly stringent conditions against companies in the same area assisting one another, as it was thought they might by doing it be acting to the detriment of the public. In 1908 an act was passed by which powers were given to electricity undertakers in London to come to terms as to stand-by supply and also to make arrangements as to management and working in districts where two companies had powers. It was in virtue of that act that the two companies came to terms as to the Westminster area. The question in the case was whether defendant company were entitled to refuse to supply alternating current through their mains when it was demanded by con-

Digitized by Google

sumers. Mr. Justice Joyce had held, in effect, that upon the construction of the agreement there had been a sale by plaintiff company of their undertaking in the Westminster area and that plaintiffs had really no interest in the Westminster area. Whereas, the fact was that plaintiff company still had large powers and rights in that area. The plaintiff company, by the agreement, had to be paid by defendants in proportion to the amount earned by defendant company by the supply of alternating current in the Westminster area and plaintiff's case was that defendants were not entitled, under their powers under the agreement, to destroy the plaintiff's chance of earning profits by the supply of alternating current. He contended that the learned judge had put a wrong construction on the agreement and that plaintiffs were entitled to the relief claimed.

Mr. CARTMELL having followed on the same side,

Mr. C. A. RUSSELL on behalf of defendants supported the judgment in the Court below.

At the conclusion of the arguments of counsel, the MASTER OF THE ROLLS gave judgment, and having referred to the material clauses of the agreement and sections of the Act of 1908, said that the agreement having been approved by the Board of Trade it was not open to either party to say that it was ultra vires. Speaking generally, what the agreement provided was that the entire management and control of plaintiff company's undertaking, so far as the Westminster area was concerned, should be vested in defendants, who should take all sums payable by customers of plaintiff company within the area, and that defendants should pay plaintiffs a fixed sum calculated on the takings of a prior year, which he would call in round figures £21,000 a year, and also guaranteeing that at the expiration of plaintiff's Parliamentary powers, and the public authority acquired the undertaking of plaintiffs, that there should be at least £100,000 for the plaintiff company. There were also provisions as to the prices to be charged by plaintiffs for electrical energy supplied by plaintiffs to defendant company, but there was nothing to be done in the Westminster area by plaintiff company. Before Mr. Justice Joyce plaintiffs contended that defendants ought not to solicit or attempt to induce any consumer in Westminster who took alternating current to cease so to do, and the defendant company had no right to compete with them. That contention seemed untenable, and his lordship considered that it was not a case were defendants were to be deprived of right of competing with plaintiffs. There was nothing from beginning to end in the agreement which said it was not to be open to defendants to say to any customer "you had better take the continuous current." He was quite satisfied that the judgment of the learned judge upon that point was right. Upon the second point raised he felt that Mr. Justice Joyce was also right, and that the appeal should be dismissed.

Lord Justice FARWELL delivered judgment to same effect.

Lord Justice KENNEDY, while feeling more difficulty upon the second point raised as to the declaration, did not see his way to differ from the conclusion arrived at by the other members of the court.

The appeal was, therefore, dismissed, with costs.

Smith v. Clothier.

At Liverpool Assizes on Tuesday, before Mr. Justice Horridge and a special jury, Wm. Smith, electrician, formerly employed by Bootle Corporation, sued Mr. T. D. Clothier, the borough electrical engineer, for damages for libel.

The alleged libel was contained in a report made by Mr. Clothier to his Electric Lighting Committee, and attributed to plaintiff's neglect a breakdown which occurred in the Bootle electric supply on Nov. 9 last year. Plaintiff's case was that the report led up to his being ultimately dismissed from the post of switchboard attendant, which he had held for nine yars. Defendant pleaded that the report was not defamatory, that it was true and that it was written without malice and on a privileged occasion.

Mr. MILLER, for plaintiff, said that the breakdown occurred in the afternoon of Nov. 9, at a time when defendant and his assistant engineer (Mr. Hudson) were present at a mayoral luncheon at the town hall. The breakdown lasted for half an hour. Plaintiff spent some time, without effect, in trying to ascertain the cause of the trouble, and the defect was ultimately located in the "balancer switch" by Mr. Hudson. Plaintiff's contention was that he was in no way responsible for the mishap.

PLAINTIFF said that when he was reprimanded he addressed a letter to the Electric Lighting Committee defending himself, but this letter was not read.

In cross-examination he said he had told Mr. Clothier he would make some revelations about the electricity station, but he did not intend that as a threat. Mr. Clothier secured him an opportunity of making the revelations he had spoken of, but on his solicitor's advice plaintiff did not go before the Committee when he was summoned.

JAMES B. HUDSON, assistant electrical engineer at Bootle, said that the switchboard was in a defective condition at the time of the breakdown. About 12 months previously it had given trouble. It ought then to have been effectively repaired, but he could not say whether that had been done. In witness's opinion plaintiff had done the best he could with the materials at his command to deal with the breakdown.

Replying to a question from his LORDSHIP, Witness said that in normal circumstances plaintiff was a competent man for his work, but owing to his excitable and erratic nature he was not resourceful in an emergency.

Mr. B. WOLFENDEN, a member of the Electric Lighting Committee, said that when plaintiff's letter was received by the Committee Mr. Clothier objected to its being read.

In cross-examination, he said that plaintiff had been dismissed because he failed to attend the special committee called to consider the complaints he had made against Mr. Clothier.

On Wednesday, the jury intimated that, having heard all the witnesses for plaintiff, they did not require to hear evidence for the defence, and were agreed that a verdict for the defendant should be returned.

His Lordship said that there was nothing against Mr. Clothier. It was simply an action against the Corporation. Judgment was then entered for defendant with costs.

Hartlepool Electric Tramways (Ltd.) and Others v. West Hartlpool Corporation.

The Court of Appeal on Wednesday decided on the application of defendants to expedite this appeal and the 17th inst. has been fixed for the hearing of the appeal of the defendants from the decision of Mr. Justice Bray, reported in THE ELECTRICIAN of June 30 (p. 477).

Jones v. Reorganisation & Control Syndicate and Another.

In the City of London Court on Wednesday Mr. S. A. Jones sued the Reorganisation & Control Synd. (Ltd.) and Mr. Demetrius J. Delyannis (otherwise De Lyann), editor of the "Cosmopolitan Financier," for the return of £45. Delyannis did not appear.

Mr. S. GOODMAN, for plaintiff, said his client had paid defendant company £45 for 40 shares (at 22s. 6d. each). It appeared that the London Electrobus Co. (Ltd.) was taken over by defendant company. Plaintiff had a considerable holding both in shares and debentures in the Electrobus Co., which ran seven or eight omnibuses in the London streets between 1906 and 1909, and in the latter year got into difficulties. In July, 1909, defendant syndicate was registered with a capital of £10,000 in £1 shares, without any articles of association. The chief promoter was Mr. Delyannis or De Lyann, who sent out a circular inviting the old shareholders of the Electrobus Co. to subscribe to defendant syndicate. Delyannis, who was managing director of the defendant company, spoke of the "splendid results" of the three months' working of the omnibuses.

Mr. OSBORN, for defendant company, said plaintiff might have a case against Delyannis, but there was not the shadow of a case against the company. Defendant company bought the omnibuses from the trustee for the debenture holders, and they ran them until the High Court stopped them. If plaintiff won all the other shareholders could bring similar actions.

Judge RENTOUL, K.C., said he could not help that. He had no doubt whatever there were material misrepresentations, and he found for plaintiff with costs. Whether the judgment would be worth anything or not he did not know.

PARLIAMENTARY INTELLIGENCE.

COAL MINES BILL.

The Grand Committee of the House of Commons, presided over by Mr. E. Wason, has continued the consideration of this Bill.

On Tuesday, clause 41, which deals with the means of signalling in shafts, was amended by the substitution of 25 yds. for 50 yds., so as to provide that every working shaft, and every shaft in the course of being sunk should, if exceeding 25 yds. in depth and not exempted in writing by the inspector of the division, be provided with some proper means for communicating distinct and definite signals from and to the bottom of the shaft, and from and to every entrance for the time being in use between the surface and the bottom of the shaft to and from the surface.

Clauses 42 to 46 were postponed and clause 47, relating to apparatus on haulage roads was, with some amendments, agreed to, clauses 48, 49 and 50 were also passed.

On Wednesday the Committee disposed of clauses 51, 52, 53, 54, and 56. These clauses relate to signalling, telephonic communication, fencing of machinery, &c., and were agreed to after some amendment.

Corporation of London (Bridges) Bill.—On Tuesday the House of Commons Committee to which this Bill has been re-committed commenced the reconsideration of the Bill, which seeks authority to construct the St. Paul's Bridge over the Thames and a thoroughfare north and south of the bridge, with tramways, and engineering and architectural evidence was given on behalf of the Dean and Chapter of St. Paul's.

On Wednesday Mr. M. Fitzmaurice, chief engineer to the London County Council, said he considered the width proposed for the new bridge and its approaches was adequate, and that the centre of the roadway was the best position for the tramway.

The Chairman subsequently announced that the Committee were of opinion that the scheme for the construction of the bridge, including the approaches, was, both in respect of architectural design and convenience of traffic, the best adapted to public needs and the best suited to the character of the site, and the Committee would report to the House accordingly.

Telegraph Construction Bill.—The Select Committee on this Bill will include Mr. Harwood-Banner, Sir Henry Norman and Mr. Herbert Samuel.

Winchester Corporation (Electric Supply) Bill.—This Bill has been read a third time in the House of Lords. The measure has to go through the House of Commons.

Sidmouth Gas & Electricity Bill.—This Bill was read a third time in the House of Commons on Wednesday.

COMMERCIAL AND INDUSTRIAL SECTION.

MUNICIPAL, FOREIGN & GENERAL NOTES.

BRITISH NOTES.

Ashburton.—Messrs. Ferguson & Co. have intimated to the Council that they will apply for a provisional electric lighting order for supplying electricity in the district.

Barnet.—The agreement between the Council and the North Metropolitan Electric Power Supply Co. has been revised as follows: This agreement to be for eight years, an annual sum of £685 to be paid in respect of the lamps mentioned in the schedule, and the clause as to the lighting without extra charge during Barnet Fair to be excised. In the event of a reduction taking place in the charge to ordinary consumers, a proportionate reduction is to be made in the charge to the Council who will consent to the erection of feeder pillars; all matters in dispute to be disposed of by arbitration, the clause as to free wiring contained in the existing agreements to be abrogated. The Council will apply for a provisional order for Arkley, and will then transfer it to the Company, which will pay all expenses incidental to the application.

Barrow.—The electric supply mains are to be extended to the Bigger Bank district, at a cost of £407.

Beckenham.—The salary of the resident electrical engineer (Mr. J. E. Tapper) has been increased from £300 to £350 per annum.

Birmingham.—In consequence of the passing of the Greater Birmingham Bill the Tramways Committee are considering a comprehensive scheme of tramway extensions and improvements.

Bradford.—On Tuesday the Corporation decided, on the recommendation of the Tramways Committee, to apply to the Board of Trade for a provisional order authorising the Corporation to use rail-less trolley vehicles on two routes within the city.

The general manager of the tramways is to consider and report as to what districts of the city might be profitably served by the rail-less trolley system, dealing particularly with certain suggested routes.

The Chairman of the committee (Mr. R. Priestley) said that all suggestions for trackless routes would be carefully considered. It was the hope of some members of the Committee that a circular route might be established, opening out more of the general system. The rail-less system was only in its infancy, but the Committee were satisfied that the vehicle in use was running satisfactorily, and that there was a good future for the system.

The Electricity Committee propose to extend the supply mains from Eccleshill to Amberley Bridge at a cost of £4,145.

Brighton.—The Council have adopted a recommendation of the Tramways Committee to appoint a deputation to visit Bradford and Leeds to inspect the rail-less trolley system of traction.

Carnarvon Castle.—In connection with the Investiture of the Prince of Wales yesterday (Thursday), Carnarvon Castle had undergone various improvements and repairs, including the installation of the electric light. Current is taken from the mains of the local electricity works. The total candle-power provided throughout the castle is 10,000, and nearly all the lighting arrangements are intended to be permanent. There is also a complete telephone and bell installation. The whole of the work was entrusted by the Office of Works to the National Electric Construction Co., and was carried out by Mr. D. O. Evans, the company's manager and engineer for North Wales.

Cheltenham.—The Corporation will apply for a provisional electric lighting order for the parishes of Bishop's Cleeve, Southam and Brockhampton and Woodmancote.

Doncaster.—An inquiry was held on Wednesday into the application of the Corporation for sanction to borrow £12,000 for extensions of the electricity works.

The Town Clerk (Mr. Tovey) said that the outstanding loans on the electricity works amounted to £47,400.

The inspector (Mr. T. C. Ekin) remarked that some of the works for which the additional loan was asked had been commenced. He asked if any of the work was outside the area under the order.

The Town Clerk said that some of the work had been commenced, and some had been done outside the area of the order. £337 had been spent on lighting Bentley-road, the reason being that there was a large colliery work a mile and a half from the borough boundary on the Bentley side. Pressure was brought to bear on the Corporation by Doncaster Rural Council, and they had in view that some time Bentley would be part of the borough. Of the £12,000 a sum of £1,899 was for excess of expenditure, and the balance was for generating plant, mains, meters, &c. £8,210 was required for a new turbo-generator, alterations to coal bunkers, &c.

The inspector said he did not think the Board would sanction borrowing powers for meters. They strongly objected to the excess expenditure, and he had no doubt the Corporation would receive a strong letter from the Board about it.

Dover.—The salary of the borough electrical engineer (Mr. L. W. Woodman) has been increased from £425 to £475 per annum. Mr. Harpur, mains superintendent, and Mr. Smith, works superintendent, have been granted increases of £25 per annum.

Electrical Trades' Benevolent Institution.—The following subscriptions and donations were received from 31st May to 30th June 1911:—

	Subscriptions.	Donations.
J. Y. Fletcher	£1 1 0	—
Eckstein, Heap & Co.	—	£5 5 0
Brook, Hurst & Co.	1 1 0	—
J. & H. Grevener	—	3 3 0
J. W. Mumby	—	0 6 0
H. Lotery & Co.	—	2 2 0
Gillespie & Beales	—	1 1 0
Frederick Smith & Co.	2 2 0	—
T. W. Lench, Ltd.	—	2 2 0
Morgan Crucible Co.	—	1 1 0
Brown Bayley's Steel Works	—	1 1 0
Robert Kearsley & Co	—	1 1 0
J. Yates & Co., Ltd.	—	1 1 0
Vacuum Oil Co.	—	1 1 0
Joseph Breeden & Co.	2 2 0	—
Martin, Earle & Co.	—	3 3 0
Walter Scott, Ltd.	—	2 2 0
Brecknell, Munro & Rogers	—	1 1 0
R. Lynen	1 1 0	—
Pritchetts & Gold	1 1 0	—
	£8 8 0	£25 10 0

Folkestone.—The Council is to enter into an agreement with Folkestone Electricity Supply Co. as to the electric lighting of the roads on the West Cliff estate, at £3. 15s. per lamp per annum when the total does not exceed 20, and £3. 10s. when the total exceeds 20.

Hendon.—The agreement between the Council and the North Metropolitan Electric Power Supply Co. for the electric lighting of High-street, Edgware, has been sealed by the Council. The surveyor has been instructed to report as to the total cost of lighting the hospital by gas and by electricity.

Hornsey.—The Council have adopted a recommendation of the Electric Supply Committee to appoint an electrical engineer to advise the Council as to the type of plant to be adopted for the proposed extension of the electricity works.

Inquest.—An inquest was opened at Swalwell on Tuesday into the death of Robert Cragg, an electrician, who was killed at Swalwell Colliery, near Newcastle, on Saturday last.

William Oloman, joiner, said that he and deceased were preparing to start the motor which worked a pump in the Brockwell seam. Deceased had not put the switch on, but he touched the switch casing, and received a shock which proved fatal. Witness tried artificial respiration without success. Deceased had india-rubber gloves with him. He had the left-hand glove on. At the time of the occurence witness thought deceased would be opening the door of the switch to find what was the matter. Deceased should have had both gloves on.

Arthur G. Booker, electrician, stated that the voltage of the current was 440 alternating. He noticed that the back of the switchboard was off and no earth wire was conneced to the pillar, and one of the contacts was askew.

The Coroner said that as it was possible that H.M. electrical inspector of factories might desire to attend the inquiry he would adjourn the inquest for a week.

Islington (London).—London County Council have agreed to sanction £5,500 of the £6,500 loan recently applied for by the Borough Council.

Leyburn.—The Rural Council have authorised Mr. Sykes of Middleham, to erect poles and wires for the supply of electricity for public and private lighting in Middleham.

Linlithgow.—Mr. Geo. Balfour has given notice of intention to apply for a provisional order.

Llanelly.—The Llanelly and District Electric Light & Traction Co. will apply for an electric lighting order to extend their area of supply to Burry Port and Pembrey, and to Loughor and Dafen.

London County Council.—On Tuesday the Parliamentary Committee reported that, presuming Part II. of the National Insurance Bill was applicable to the Council's staff who came within the definition of workmen, there were 10,694 drivers, conductors, motor men, &c., who would come Tithin Part I. of the bill and 3,094 who would come within Part II., and as an employer the contributions would cost the Council £7,000 a year.

East India Dock-road Tramways.—The Highways Committee recommended a capital expenditure of £21,300 for the extension of the tram-

Digitized by Google

ways in East India Dock-road to the county boundary at Barking-road, bridge. It is proposed to instal the conduit system.—*Postponed.*

Seven Sisters-road Tramways.—The same Committee also recommended the expenditure on capital account of £18,150 for the adaptation of the underground conduit system of electric traction of the tramways between Stroud Green-road and Green-lanes, and the construction of a junction line.—*Adjourned.*

Marylebone (London).—The whole of the public lamps in the borough have now been converted to electric light.

The Electric Supply Committee report that, subject to notice, the period of the Council's agreement with Mr. Arthur Wright, consulting engineer to the Council, would terminate at the end of March next, and they had decided (subject to the usual sanction) to give notice to Mr. Wright accordingly. The Council would still be able to have the benefit of Mr. Wright's advice in a consultative capacity if desired.

Oulton Broads.—Some time ago the Council decided to enter into an agreement to take a supply of electricity in bulk from the East Anglian Ice Co., but this resolution has been rescinded in favour of a scheme for the purchase of the undertaking of the Oulton Broad Electricity Co., which is supplying current in the district. The purchase price of the plant (without the generating station) is £1,300, and the company undertake to supply the Council with electrical energy at 230 volts at the following rates: Up to 20,000 units per annum at 2¼d.; 50,000, 2¼d.; 100,000, 2d.; 200,000, 1¾d.; above 200,000, 1¾d., the contract to be for 25 years, with an option to the Council to take over the generating plant at 15 years at a valuation. The company would accept payment of the £1,300 in instalments to be spread over 5¾ years.

Poplar.—The electrical engineer (Mr. J. H. Bowden) reports that an expenditure on feeders is necessary for next winter's heavy load, at a cost of £1,280. There will also be extensions of the distribution network, making the total cost of extensions for the year £6,635.

Rotherham.—The Board of Trade has issued an order giving the Council power to supply electricity in Greasborough.

Scarborough.—The Streets and Buildings Committee have approved the estimate (about £6,000) of the borough engineer (Mr. W. H. Smith) for taking up the rails and reinstating the highways now occupied by the electric tramway tracks, and the engineer was instructed to forward the estimate to the Trackless Tramways Co., who are negotiating with the local tramways company as to taking over the tramway service.

Sheffield.—The Tramways Committee recommend the City Council to obtain powers in their next Parliamentary bill to extend the tramways in eight directions, and also to run rail-less electric cars on roads connecting some of the outlying suburbs. The recommendations were accepted.

Owing to the increasing demand for electrical energy for power and lighting, the manager of the electric lighting department (Mr. S. E. Fedden) recommends the Council to sanction the expenditure of £61,000 on extensions of plant, &c.

Mr. Fedden states that the regular demand upon the works is from 8,500 to 9,000 kw. and there is an increase of 2,000 kw. each year. Next winter he anticipates that even with the new plant now under construction he will have no margin, and no time should be lost in placing the order for plant, which includes £16,800 for three new boilers and accessories, £2,500 for three economisers, 83,800 for pipework, £20,000 for one 4,000 to 6,000 kw. turbo-alternator, £4,600 for switchboard, £980 for machine cables, and £9,275 for buildings. The matter has been referred to the Finance Consultative Committee for report.

A proposal to employ overhead wiring in connection with the extension of street lighting to Attercliffe has been referred back.

Turton.—The Council have applied for sanction to a loan of £4,500 for distributing cables, house services, &c.

Wholesale Hardware Club.—We have received a copy of a booklet issued by this Club, which contains a short history of the Club, list of members and other information.

The President for 1911 is Mr. Chas. Churchill, and the honorary council for the current year include Messrs. K. Allwood (General Electric Co.), J. Scott Balfour (J. P. Craggon & Co.), F. A. B. Lord (W. F. Dennis & Co.), S. Ewart (Ewart & Son) and other gentlemen prominent in the hardware industries. The hon. secretary is Mr. Jas. Keeves and the secretary Mr. R. Cooper, and the offices are at Royal London House, 14, Finsbury-sq., E.C. The annual subscription is two guineas and the Club has departments to deal with insurance, debt recovery, legal work and other matters of considerable importance to the trades comprised in the hardware and allied industries. The social side does not appear to have been neglected, and meetings of the various sections are frequently held at the offices to discuss trade matters. No doubt the Club will serve a very useful purpose, and when properly organised should be of considerable advantage to its members.

Will.—Mr. E. Boulnois, chairman of the Central Electric Supply Co., and a director of the Westminster Electric Supply Corpn., and of the Calcutta Electric Supply Corpn., &c., left estate of the gross value of £55,157, of which the net personalty has been sworn at £43,941.

Wireless Patents Litigation.—With regard to statements that have appeared as to proceedings commenced against the Marconi International Marine Communication Co. (Ltd.) by the Lodge-Muirhead Wireless & General Telegraph Synd. (Ltd.), Messrs. Coward, Hawskley, Sons & Chance, solicitors to the Marconi Companies, notify that proceedings had been instituted by the Marconi Co. against the Lodge-Muirhead Synd. prior to the action taken by the Lodge-Muirhead Synd.

Wireless Telegraph Notes.—A wireless station has been erected at Swakopmund by the military authorities. Steamers of the German East African line have all been fitted with wireless apparatus and messages are frequently interchanged between these vessels and Swakopmund.

It is reported that negotiations are proceeding between the Australian Wireless (Ltd.) and the Federal Government for a licence to allow the syndicate to establish and operate for commercial purposes a temporary wireless station in Melbourne. The rates to be charged for wireless messages received in or to be sent to Australia are (it is further stated) under consideration. A fixed minimum fee for each message is suggested, probably a minimum of about 5s. for a message of four or five words, with an extra charge of 1s. or 1s. 3d. for each additional word.

At the Investiture of H.R.H. Prince Edward as Prince of Wales at Carnarvon yesterday two wireless telegraph stations were established, equipped with Marconi sets. One was situated within the precincts of Carnarvon Castle and the second in the neighbourhood of the Yeomanry camp. These stations were also in communication with the Royal yacht and the vessels of the Fleet stationed at Holyhead, and with the camp of the Western Division. The sets of apparatus are the property of the Westmoreland and Cumberland Yeomanry, and are similar to the sets which are now in general use in military operations in this country.

The Postmaster-General has issued a notice that radiotelegrams can now be handed in at any telegraph office in the United Kingdom for transmission to ships equipped with wireless telegraph apparatus, at a charge of 10½d. per word without a minimum, or 2½d. with a minimum of 2—1, or 5d. with a minimum of 2—6, in each case, for messages to ships making Atlantic voyages. When ships have passed out of range of the Post Office stations they are accepted for transmission through the Marconi Co.'s long-distance station at Poldhu at 3s. a word without a minimum. Radiotelegrams are also accepted for transmission to ships through wireless stations abroad. Information on the subject can be obtained at any telegraph office.

York.—The Council in committee have adopted recommendations to construct tramways to the Bishopsthorpe-road district at £16,440, and to Heworth at £25,263.

Electro-Harmonic Society.—The W. E. Lane Testimonial Fund.—The presentation to be made to Mr. Lane in recognition of his long and excellent services to this Society will be made on the occasion of the first concert of the ensuing season. The action of the executive committee in proposing this testimonial to Mr. Lane has received the cordial approval of the members when making their donations.

Outing.—The employés of Messrs. Bruce Peebles & Co. selected Crieff this year for their annual outing. The party numbered over 400 and was favoured by the best of weather. Sports and prizes, drives, walks, golf, &c., were enjoyed, the outing proving most successful.

COLONIAL AND FOREIGN NOTES.

Argentina.—The "Review of the River Plate" says the Cia Electrica del Norte has applied to the Municipality of Santiago de Estero for an electric tramway concession.

Mendoza Government has approved plans for electric tramways in the city of Mendoza, under the concession held by the Electric Light & Power Co., and the concession for water power has been increased to 1,600 h.p.

The Government have accepted the proposal of the Lacroze Tramway Co. (Buenos Ayres) to extend their lines to Campo de Mayo.

The Cia Franco-Argentina de Electricidad has applied to Government for authority to increase the capital from $3,000,000 to $10,000,000 (paper), and to issue debentures (in gold or paper) in Argentina or abroad. The company was formed a few months ago to purchase the electricity supply works at Salta, and has since purchased the Lemoussin concession for a station at La Plata, the construction of which will shortly commence. It is stated that it has also acquired a controlling interest in the Anglo-Argentine Electricity Co., which owns stations at Concordia, Gualeguay, Uruguay, Gualeguaychu (gas and electric), Chascomus and Tandil

Digitized by Google

Philipp, Holzmann & Co. have obtained a contract from the Anglo-Argentine Tramway Co. for the construction of the underground railway between Plazas Once and Mayo (Buenos Ayres).

Australasia.—Continuing its sittings at Melbourne, the Metropolitan Traffic Commission took evidence from Mr. W. J. C. Riddell, chairman of the Melbourne and Metropolitan Board of Works.

Mr. RIDDELL said he was in favour of municipal, as against State control of tramways. Surpluses from the tramways should be retained for tramway uses, and should not be divided amongst the municipalities. After a sufficient sinking fund had been built up the remainder of the surpluses should be devoted to reducing fares. He thought the supply of electric power for all public services in Melbourne should be carried out by one authority.

Mr. J. TURNBULL (superintending engineer of the Melbourne Tramway & Omnibus Co.) said electrical machinery could be used to drive the company's cable cars, but he could not see what economy there would be. With steam power the speed could be increased, but the machinery would have to be altered. The company's lease expired in 1916.

Mr. W. CALDER (civil engineer to Prahran Council) said there were three street miles of cable trams and two of electric trams in Prahran. He was opposed to centre poles, and to overhead wires in the principal streets, and he favoured municipal as opposed to State control.

The Commission subsequently visited Sydney, where Mr. JOHN KNEESHAW (tramway traffic superintendent and member of the Tramway Advisory Board) said, in evidence, that the Board dealt with tramway proposals involving a less expenditure than £20,000. All the purely tramway lines in N.S.W. were controlled by the State, except two miles from Rockdale to Brighton-le-Sands. The tramways in Sydney and suburbs were equal to 184¾ miles single track, mostly electric, and the question of converting the 17 miles of steam tramways on the outskirts of Sydney was under consideration. The revenue was £1,000,000 last year and the debt outstanding was £4,335,000. There was 5 per cent. return on the capital. The electrical system overcame a rush of traffic more readily than the cable system, being more flexible.

Austria-Hungary.—The "Oesterreishischer Zentral-Anzeiger" states that Budapest municipal authorities intend to establish an electric power plant with a capacity of 10,000 kw., at a cost of about £416,000, and the owners of the Budapest Electric Railway have applied to the local authorities for permission to extend their generating station on the bank of the Danube.

A syndicate has been formed at Göiz to erect electric power works. Herren Ignaz Rüsch and Leopold Rhomberg, of Dornbirn, have submitted to the Water Rights Commission a project for the use of the falls of the Leiser between Gmund and Seebach for the generation of electrical energy at Spittal (Carinthia).

Chili.—Señores Juan Bersano and Natalio Farinelli have secured a 10 years' concession for the construction and working of an electric tramway in Valdivia.

Customs Duties.—A recent supplement to the Australian Customs Tariff Guide states that the following duties are leviable on imports into the Commonwealth:—

Electric bells (brass or gunmetal) 30 per cent. (British goods 25 per cent.) ad val.; brush holders for dynamos, 20 per cent. (British or other).

According to a recent decision, paper tape (in rolls) for use with telegraph machines is subject, on importation into British South Africa, to import duty of 3 per cent. ad val., under the General Tariff. British goods are subject to 3 per cent. rebate.

France.—Consular reports state that work in completion of the Bassin Loubet at Boulogne has slackened. The quays (900 metres in length) are to be supplied with 20 electric cranes.

In the Lyons district the factory system has, in great measure, superseded family looms, but at St. Etienne and adjacent districts the family workshop holds its own. Here electric power can be adapted to the ribbon looms with little disturbance or reconstruction of the machinery, while in the case of piece goods the rebuilding of the entire loom mechanism is said to be necessary. A trimming (passementerie) hand loom can be converted into a power loom for £12, the conversion of a piece-goods loom being from £56 to £60. This accounts for the modest success that has attended the efforts in Lyons of a society formed for the purpose. The number of small power looms at Lyons has only increased from 343 in 1906 to 381 in 1909, whereas at St. Etienne the conversion has been successfully carried on. In the Loire and Haute Loire there are about 35,000 looms, of which 5,000 are in large works, while the remainder are in small private workshops. Of these 28,000 looms about 12,000 are driven by electricity. The operation of the law of March 30, 1900, relating to hours of labour is said to inflict some hardship on the silk industry dependent for their motive power on electricity generated by water, as storms, low water or frosts sometimes interfere with the flow of the water and cause a stoppage of work for several hours. The law, however, not only restricts the working day to 10 hours, but makes it obligatory on the factory owner to fix beforehand and post up on his premises the hours during which his works are open and the various intervals for rest, with the time at which they begin and end. These irregular stoppages affect adversely those who depend on the hydro-electric works for their power. Many factory owners have agreements with the electric power companies for a term of years, and some ingenuity has been expended in devising expedients by means of which they may make up time lost by these stoppages of current while keeping within the law. It is hoped that the regulations may be amended by increasing the number of overtime days per year, or by allowing such hours as have been lost owing to the interruption in power supply to be made up on a certain number of subsequent days without being reckoned as overtime.

The building of steam engines for industry purposes has been declining for some years, owing to the growing competition of electricity generated by water power in the Alps and transmitted to Lyons by overhead cables. The manufacture of electric cables and wire is in a flourishing condition.

Electricity has been substituted for steam as the motive power of the Lyons waterworks.

There has been considerable opposition to the scheme for the construction of a barrage across the Rhône at Genissiat, below Bellegarde, a lake covering 900 acres and extending to the Swiss frontier, and a waterfall with a fall of some 220 ft., to generate 170,000 H.P. of electrical energy, which it is intended to transmit to Paris. Two rival schemes have been formulated, and are receiving considerable support locally. One was presented by the French company who are actually using the natural fall of the Rhone at Bellegrade (50 ft.) for generating electrical energy which they distribute to consumers in the Departments of the Ain and Savoie. This scheme involves the construction of a large barrage on the site of the existing dam, above the Perte du Rhone, which would not be destroyed as in the Genissiat scheme. Power houses would be constructed at Coupy, close to the barrage, and at Elvise, and these, with the existing station at Bellegarde, would be capable of generating nearly 200,000 H.P. in summer and 100,000 H.P. at low water in winter. The second scheme, formulated by another French company, is more in the nature of a complement to the first, and contemplates the construction of another barrage creating a second smaller lake 3 miles in length, below the larger one, and forming a fall some 65 ft., capable of generating a minimum of 30,000 H.P. The energy thus produced would, it is thought, lead to the erection of electro-metallurgical and electro-chemical works in the area served. These alternative projects are regarded with more favour locally than the Genissiat scheme.

The Government will shortly erect, at an estimated cost of £40,000, a large power house on the River Drac (Isre) for generating electricity required for working a new railway to be constructed by the State from La Mure, the coal mining centre, to Gap (Hautes Alps) on the Paris, Lyons and Mediterranean Railway from Briançon to Marseilles, connecting up the coalfields directly with the chief French shipping port.

The experimental installation at Lyons of the Lorimer automatic telephone system, originally designed to last 12 months, was prolonged for another year, and only came to an end towards the close of 1910. It is stated that "the unqualified success of the experiment after so thorough a trial was signally proved by the reluctance displayed by the 200 persons who had been provided with the automatic apparatus to return to the ordinary service. There does not, however, appear (according to the report mentioned) to be any immediate prospect that the State will adopt the Lorimer system, though the question is still under consideration.

Experiments are being made by one or two of the colliery companies in the district in the generation of electrical energy by low grade coal.

There is a tendency towards the creation of small home workshops in the country districts round Roanne, with electricity as their motive power.

German South-West Africa.—A consular report states that land-line telegraphic communication (at 3d. per word) has been opened from the Union of South Africa to German South-West Africa. In the other direction the charge is about 3.d. per word. There is a good telephone system in the Protectorate, embracing about 50 towns and villages.

India.—"Indian Engineering" states that the Jamalpore locomotive workshops of the East Indian Railway are now manufacturing a three-phase auto-transformer in three units, and an e.h.t. single-phase tranformers for use in the testing and calibration of electricity meters, &c.

The South Indian Railway Co. have purchased a 25 H.P. motor for driving machinery in the boiler shop at the Negapatam workshops.

Telephone communication is being provided between stations on the East Indian Railway from Lillooah and Khana Junction.

Italy.—The Soc. Varesina per Impress Elettriche have obtained a concession for the construction of an electric tramway from Varese to Bizzozgero.

The Municipality of Rome decided on Tuesday to consider a scheme for the construction of an underground electric railway in the city, which would embody certain features of the London and Paris lines.

Spain.—H.M. Legation at Madrid reports that under the law for the suppression of the "consumos" or octroi duties, the duties are suppressed from July 1, 1911, in such towns as are not bound by contract to farm out the duties after that date. In other towns the duties will be abolished at various times before Jan., 1921. The chief sources of municipal revenue will in future include a surcharge on the State tax on the consumption of gas and electricity.

Switzerland.—A concession has been granted to Messrs. Masson (Veytaux), Gilliéron (Vevey) and Chenaux (Villeneuve) for the construction of an electric railway, on the rack and pinion principle, from Glion to Sonchaux, with a branch to Caux. The line will be nearly 3 miles in length, and the cost is estimated at £64,000.

Digitized by Google

ELECTRICITY SUPPLY AND TRAMWAY ACCOUNTS.

Burnley.—The capital expended on the electricity undertaking at March 31 was £117,450, an increase of £5,208 over 1910.

The net income from the sale of current was £24,613, and meter and motor rental, &c., brought the total to £25,127. The total costs were £11,034, leaving a gross profit of £14,092. Interest absorbed £2,723. 10s., sinking fund £4,384, depreciation £1,468, and after paying interest on consumers' deposits (£17) the balance (£5,500) was devoted to relief of rates. The works costs were 0·535d. (against 0·621d.) and total costs (including capital charges) 1·228d. (against 1·392d.) per unit sold. There are 1,157 consumers (998), and the total connections in 32-watt lamps are equal to 82,605 (72,908), and the motors connected are equal to 841¾ (710¾) B.H.P. The maximum load was 2,100 kw. (1,772 kw.) and the load-factor 19·28 (20·93) per cent. 3,547,985 (3,249,387) units were sold, including 1,099,965 (972,549) for private lighting, power, &c., 7,522 (7,522) public lighting, and 2,440,498 (2,269,325) for traction.

Darwen.—The total income of the tramways department for the year ended March 31 was £13,790, including £13,548 from traffic receipts.

The total expenses (including £1,050 for depreciation) were £9,721. Interest required £2,069 and sinking fund instalments £2,186, leaving a deficit of £390. The total capital expended is £85,725. 2,601,007 passengers were carried and 250,064 car-miles run.

Glasgow.—The accounts of the electricity supply department for the year ended May 31 show gross revenue £260,526, against £245,960 in 1909-10.

The working expenses were £109,547, against £105,138, and after paying interest (£58,605), sinking fund (£41,142) and allowing for depreciation (£44,552) there was a net surplus of £6,680 (against £191) which has been transferred to reserve. The ratio of increase in working expenses to increase in revenue is regarded as particularly gratifying as 5,826,409 units more were generated. The average cost per unit has been reduced 0·1005d. The other expenses are much the same as last year, but an increase of £1,007 is shown in rates, taxes and assessments. The capital expenditure for the year was £80,833, making the total capital expenditure £1,889,715. During the year domestic consumers obtained energy for cooking, heating and other domestic uses at 1d. per unit compared with 3d. per unit for lighting, without separate wiring. The number of consumers already benefiting by this scheme, which was only started in Oct. last, is 300. With the above modification the committee recommend that the rates be the same as last year. The number of consumers at May 31, 1911, was 21,166, compared with 19,489, an increase of 1,677.

Gloucester.—The capital expenditure on the electricity undertaking for the year ended March 31 was £867, making the total £91,906.

The total revenue was £13,609, including £10,316 net from sale of current and £2,508 from Light Railways Committee. The total expenditure was £6,876, leaving a balance of £6,734 to meet interest (£2,776), sinking fund, &c. (£2,881), and out of the surplus from the working of the last two years a sum has been applied in paying for meters and other items, leaving £941 to be carried forward; 832,313 units were sold to private consumers for light and power, and 199,527 supplied for public lighting and 601,832 for traction. The total maximum supply demanded was 770 kw. for light and power and 476 kw. for traction.

In the report of the electrical engineer (Mr. F. H. Corson) it is stated that the output for lighting and power increased by about 177,000 units and the current sold for industrial power was more than double in amount that of 1909-10. There are 745 consumers an increase of 55, and the equivalent of 71,538 30-watt lamps is connected, an increase of 6,971.

Hull.—The accounts of the tramways department for the year ended March last show capital expenditure (including £2,485 on motor 'buses) £491,418 (increase £7,000). The total amount contributed to sinking fund is £89,109 and to reserve fund £51,558.

On the tramways the revenue was £143,340, working expenses were £95,509, gross profit was £47,830. After paying interest on capital, loan instalments, contribution of £2,528 for street widening, and £1,844 income-tax, and taking into account £5,121 deficit on the motor omnibuses, there was a surplus of £13,251. Car miles run (on the tramways) were 3,695,281, passengers carried were 37,415,152 and units used 4,444,335. Traffic revenue was 9·22d. per car mile and working expenses (with power) were 6·39d.

The accounts of the electricity supply department (which made a profit of £8,347 on the year's working) were abstracted in THE ELECTRICIAN for June 30 (page 480).

Newcastle-under-Lyme.—The capital expenditure on the electric light department for the year ended March 31 was £9,793, an increase of £82 over 1910.

The income from sale of current was £1,882, and with meter rental, &c., the total was £1,945. The working expenses were £769, and after allowing £12 for bad debts the gross profit was £1,164. Interest required £315 and repayment of principal and sinking fund £407, leaving a net profit of £441, against £83. The units sold were 83,262 (72,221 for lighting and 11,041 for power). The maximum load was 107 kw.

West Ham.—The total income of the tramways department for the year ended March 31 was £128,408, including £129,659 (10·138d. per car-mile) traffic revenue.

The working expenses were £91,209, leaving a gross profit of £37,199. Interest and stock dividends absorbed £14,199, interest on mortgage loans £3,958, hire of tramcars £31, contributions to loans and sinking funds £11,030, and of the unappropriated balance £8,513) a sum of £1,590 has been devoted for top covers to cars and to adapting cars for through running on conduit system, and £6,923 placed to reserve. The capital expenditure is £533,245, an increase of £619. During the year £8,718 was spent on track maintenance, against £3,429; 12 additional tramcars were delivered, bringing the total to 118, and another 20 of the old cars are being fitted with top covers by direct labour. The consumption of electrical energy for traction amounted to 5,182,257 units (1·69 unit per car-mile) and the cost was £20,513. Meters have been fixed on some cars and the average consumption per car-mile by these cars was 1·26. It is, therefore, proposed to extend the use of meters. Experiments with metal filament lamps for car lighting have been made with encouraging results. 37,297,992 passengers were carried against 36,846,649, and 3,069,324 car-miles run, against 2,907,805.

TRADE NOTES AND NOTICES.

TENDERS INVITED

BRADFORD Corporation invite tenders for the supply and erection of two water-tube boilers, stokers and superheaters, and one 12-ton electrically-operated overhead travelling crane. Copies of specification, conditions of contract and forms of tender from the city electrical engineer and manager, Mr. Thos. Roles, Electricity Offices, Town Hall, Bradford. Tenders to the Town Clerk, Mr. Frederick Stevens, by 10 a.m. Tuesday, July 25. See also an advertisement.

WOLVERHAMPTON Electricity Committee invite tenders for the supply, delivery and erection of a 264-cell, 6,000 ampere-hour storage battery together with a motor-driven regulating switch; two motor-driven boosters (approximately 150 kw. output each) and switchgear and instruments. Specifications from the borough electrical and tramways engineer, Mr. C. E. C. Shawfield, M.I.E.E. Tenders, addressed to the Chairman of the Electricity Committee, Town Hall, Wolverhampton, must be in by 10 a.m. July 31. See advertisement.

Tenders are invited for supplying plant and materials and the erection of electric supply station buildings for lighting the DUNDALK Urban District area, under its Electric Lighting Order, 1897. The plant includes generating station buildings, gas producing and generating plant, balancer and booster, switchboard, storage battery, mains (overhead and underground) electricity meters and travelling cranes. Copies of specifications, general conditions, &c., may be seen at the offices of the clerk, Mr. Mathew Comerford, Town Hall, Dundalk, or at the offices of the consulting engineers, Messrs. T. L. Miller, Wilson & Pegg, Donegall-square, Belfast, 709, Tower-buildings, Liverpool, or 19, Brazenose-street, Manchester. Tenders to the town clerk, Dundalk, by 10 a.m. July 24. See also an advertisement.

Tenders are invited up to Aug. 23 for the supply of telegraph and telephone material to the Postmaster-General's Department in SOUTH AUSTRALIA. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W. See also an advertisement.

Tenders are invited up to Aug. 16 for cable, conduits, c.i. pipes, iron poles, insulators, wires, &c., for the Postmaster-General's Department in QUEENSLAND. Specifications from the Commonwealth Offices, 72, Victoria-street, London, S.W. See an advertisement.

Tenders are invited (up to Aug. 15) for the supply of (*a*) 80,000 insulators and (*b*) indiarubber covered wire to the Postmaster General's Department in VICTORIA, and (up to Aug. 23) for the supply of letter box fronts to the Postmaster-General's Department in QUEENSLAND. Tender forms and specifications from the Commonwealth Office, 72, Victoria-street, London, S.W. See also advertisements.

LONDON County Council require tenders by 11 a.m. July 18 for supply of steel tyres for tramcars—6,000 for driving wheels and 4,000 for pony wheels. Specifications, &c., from the Chief Officer.

LONDON County Council also require tenders, by 11 a.m. July 1 for supply of tramway track insulators until April 30, 1912. Specifications from the Chief Officer.

LONDON County Council also require tenders by 11 a.m. July for roadwork and platelaying of conduit system tramways in Gree lanes, Mildmay Park and Southgate-road and Seven Sister's-roa and for the construction of a tramway from Brixton to Herne H on the overhead system and for paving works and street widenin Specifications from the Chief Engineer.

The Urban District Council of ESHER and the DITTONS inv tenders for the installation of a system of wireless alarms in Than Ditton and Long Ditton wards of the district. A plan of the distr may be seen at the Surveyor's offices, where particulars may obtained. Tenders to the clerk, Mr. E. A. Everett, Council Offic Thames Ditton, by July 24.

YORK Corporation want tenders by noon July 17 for about 2,000 of h.t. 3-ph. underground mains laid solid, and for erection of a batte

Digitized by Google

room at Foss Islands electricity works. Specifications for cables from the City Electrical Engineer and for battery room from the City Engineer.

WALTHAMSTOW Council require tenders by noon July 21 for feeder cables and stoneware conduits. Specifications, &c., from Mr. G. R. Spurr, Electricity works, Walthamstow.

ILFORD Education Committee want tenders by noon July 15 for wiring and supply of fittings at Cleveland-road School, Ilford. Specifications from Mr. A. H. Shaw.

ERDINGTON Tramways Committee require tenders for construction of permanent way (copper bonding, wood paving, &c.) of about 1¼ miles of double track tramways, and for laying about 10,000 yds. super. of Jarrah wood paving between the permanent way and the kerb. Particulars from the Engineer.

Committees of BACUP Council invite tenders for wiring and fitting premises (General Works Committee), court house, police buildings and fire station (Watching and Fire Brigade Committee), and wiring and fitting the baths.

WEDNESBURY Corporation require tenders by mid-day July 24 for supply of 150-cell battery (470 amperes at 1½ hour rate of discharge), about 2,400 yd. 0.25 sq. in. concentric lead-covered paper-insulated cable, and joint boxes. Specifications, &c., rom the Engineer and Manager of the Electricity Department.

SOUTHAMPTON Corporation require tenders by 11 a.m. July 19 for supply of a motor generator and a condenser. Specifications, &c., from the Borough Electrical Engineer.

PONTYPRIDD Council require tenders by July 18 for supply of an additional unit at their Treforest refuse destructor. Specifications from Mr. J. E. Teasdel, Treforest.

Tenders are required by 10 a.m. July 24 for wiring work, &c., at the County Hall, The Castle, WINCHESTER, where forms can be obtained.

Tenders are invited up to July 18 for the supply of 4 tons 6 cwt. bare hard-drawn copper cables to the City of MELBOURNE, Australia. Copies of specification, tender forms, &c., from the agents for the City Council (McIlwraith, McEacharn & Co. Ppty., Ltd.), Billiter-square-buildings, London, E.C.

Tenders are invited up to Aug. 9 for the supply of letter-box fronts to the Postmaster-General's Department in NEW SOUTH WALES and for four motor cars (petrol) complete and for the supply of letter box fronts to the Postmaster-General's Department in SOUTH AUSTRALIA. Tender forms and specifications from 72, Victoria-street, London, S.W.

Tenders are invited up to July 23 for 12 sections of a branching multiple magneto lamp signalling switchboard, &c., or one automatic or semi-automatic switchboard, &c., to the Postmaster-General's Department in VICTORIA; up to July 31 for telegraph and telephone material for the Postmaster-General's Department, HOBART (Tasmania); up to Aug. 8 for measuring instruments, telephone instruments and parts, trembling bells and gong to the Postmaster-General's Department in VICTORIA; and up to Aug. 23 for telegraph, telephone and electric lighting material to the Deputy Postmaster-General in NEW SOUTH WALES. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W.

Tenders are invited up to Aug. 30 for the supply of porcelain insulators, copper wire, sleeves, &c., to the Postmaster-General's department in SOUTH AUSTRALIA. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W.

Tenders will be received at the Post and Telegraph Office, Paris, until July 18 for supply of rubber insulated electric cables, &c.

CALCUTTA ELECTRIC SUPPLY CORPN. (LTD.) are prepared to receive tenders for the supply, delivery and erection at the site of their Cossipore station, Calcutta, of auxiliary plant, and pipework. Copies of specification, drawings, &c., from the Secretary of the company, Mr. Francis R. Reeves, Salisbury House, London Wall, London, E.C., to whom tenders by 10 a.m. July 24.

The time for the receipt of tenders by the Ministry of Public Works, Constantinople, for an electric power and tramway concession for JERUSALEM, is extended to Sept. 13. Specifications (in French) may be seen at 73, Basinghall-street, London, E.C.

The Metropolitan Water and Sewerage Board, Albert-street, BRISBANE, Queensland, want tenders by noon Jan. 30 next for supply and erection, of one, two or three complete units, each consisting of power generating plant and pump or pumps to lift not less than 6,000,000 gallons per day. Particulars from the Secretary.

MORTLAKE (Victoria) Butter & Cheese Factory Co. require tenders by noon Aug. 14 for supply of dynamo and booster, storage batteries and accessories, switchboard, cables, &c. Specifications from Messrs. F. A. McCarty & Co., 31, Queen-street, Melbourne.

WELLINGTON (N.Z.) Corporation require tenders by 4 p.m. Aug. 24 for supply of a motor power waggon and accessories for the electric tramways department. Gonville and Castlecliff Tramway Board, Ridgway-street, WANGANUI (N.Z.) require tenders by 4 p.m. Aug. 14 for supply of overhead tramway material, feeders, &c. Conditions, &c., can be seen at 73, Basinghall-street, London, E.C. Representation in New Zealand is necessary.

STAVROPAL (Caucasus) Municipal Council invite tenders until Aug. 14 (O.S. Aug. 1) for the construction and working of an electric tramway.

Tenders will be received at the Town Hall, SYZRAN, Russia, on Oct. 14, for the construction of an electric tramway and the supply of electrical energy for lighting.

PHILIPPOLIS (Bulgaria) Municipality require tenders by Aug. 4 for a 50 years' concession for electric or gas lighting and for the provision of electric tramways. A deposit of £6,800 is required.

TENDERS RECEIVED AND ACCEPTED.

London County Council have received the following tenders for the supply, &c., of four car-traversers for the Cressy-road, Streatham (extension), Camberwell (extension) and Hammersmith (third section) car sheds :—

Brush Electrical Engineering Co. (*accepted*)	£2,297
Dick, Kerr & Co.	2,452
Hurst, Nelson & Co.	2,525
Cowans, Sheldon & Co.	2,592
S. S. Whiteley & Co.	2,768
S. H. Heywood & Co.	2,780
Heenan & Froude	2,962
Stothert & Pitt	3,822

Chief officer's estimate, £2,900.

The Brush Co. are to be allowed to sub-let to A. Hickman (Ltd.), the Shelton Iron, Steel and Coal Co., the Lilleshall Co., or Stewarts and Lloyds, the rolled steel sections and plates; to F. H. Lloyd & Co., or Rennies Steel Castings Co., the general steel castings; to Hadfield's Steel Foundry Co., the steel castings (wheel centres); to Cammell, Laird & Co., the tyre forgings; to J. Baker & Co., the axle forgings; to F. W. Rowlands, the case-hardened pinions and gear wheels; to Samuel Buckley & Sons, Hall and Pickles, or William Robertson, the bright rolled or drawn shafting; to T. A. Ashton, or R. Hunt & Co., the turned shafting; J. Crowleys & Sons, or Jonas Wells, the malleable iron castings; and the Anti-Attrition Metal Co., the pedestal bearings.

London County Council have also received the following tenders for (*a*) weighbridges for the Greenwich-road permanent-way depot for weighing permanent way materials, sand for cars, &c.; and (*b*) (in place of an existing weighbridge) for Old Kent-road central stores depot, in connection with the electric transport vehicles :—

	(*a*)		(*b*)
Ashworth, Son & Co., (*acc.* for (*a*))	£133	.....	£130
W. & T. Avery (*acc.* for (*b*))	142	.....	122
Day & Millward	140	.....	145
H. Pooley & Son	154	.....	140
Bartlett & Son	155	.....	139

Chief officer's estimates, £145 and £130.

Ashworth, Son & Co. are to be allowed to sub-let to Walter Scott (Ltd.) the steel girders for the weighbridge for the Old Kent-road depot.

London County Council have also accepted the tender of Hadfield's Steel Foundry Co. for cross-over for Victoria Embankment tramways, £563. 13s. 6d.

West Ham Corporation recently obtained competitive schemes and prices from four firms for the extension of the e.h.t. switchgear. Of the schemes, the best in the opinion of the electrical engineer (Mr. H. H. Couzens) were those submitted by the British Thomson-Houston Co. and the British Westinghouse Co. The two firms were subsequently asked to quote for an extended scheme, which would allow of the re-arrangement of all the Council's switchgear as follows :—(1) converting the old British Thomson-Houston 6,000-volt board for 2,000-volt working, and transfer the existing feeders to the new board, replacing them by those on the Ferranti board, the last mentioned to be used for works supply and pioneer work where required. (2) The feeders at present connected to what is known as the "stop" switchgear, viz., that situated on the elevated platform to be replaced by the step-up transformers, which are to be re-arranged. The quotations received were :—British Westinghouse Co., £1,885; British Thomson-Houston Co., £2,031. In Mr. Couzen's opinion the tender of the British Thomson-Houston Co. should be accepted because of the better general design, greater immunity from breakdown, and the apparatus more accessible. He also suggested that a provisional sum of £150 be included in the contract to cover cost of adding "arresters," &c., subject to the settlement of detail. These recommendations were agreed to by the Council.

The tender of F. Smith & Co., has also been accepted for supply of trolley wire, &c., at £3. 11s. 2d. per cwt., less 2½ per cent.

Woolwich Electricity Committee have received tenders for supply of "Association" grade small wires :—

W. T. Glover & Co., £1,452. 5s.; Baxendale & Co., £1,452. 6s.; Siemens Bros. & Co., £1,415. 19s. 6d.; New Gutta Percha Co.,

Digitized by Google

£1,221. 2s. 6d.; Sun Electrical Co., £1,182. 16s. 3d.; C. A. Macintosh & Co., £1,097. 10s. 2d.; Liverpool Electric Co., £1,074. 9s.; General Electric Co., £907. 15s. 7d.; W. Geipel & Co., £892. 2s.; Aubert, Grenier & Co., £836. 8s.; Pirelli (Ltd.), £826. 17s.; Adnil Electric Co., £739. 5s.

The Committee reported that the tenders related to 13 sizes of cable, to be ordered in quantities as required, the prices being for lengths of one mile. Having regard to the tenders as a whole, they were of opinion that the General Electric Co.'s was the most advantageous, and recommended that this tender be accepted to a value of £1,000.—Agreed.

Hull Tramways Committee have accepted the following tenders:—Brush Co., 18 or 24 car bodies, £347 each, and trucks, £37. 10s. each; Siemens Bros. Dynamo Works, 18 or 24 pairs 33 h.p. motors, £180 per tram, and controllers, £49. 10s. per tram; John Baker & Co., wheels and axles, £10. 10s. per pair; Bricknell, Munro & Rodgers, trolleys, £6. 5s. each; W. Boydell & Son, resistances, £9. 5s. per pair.

The City of London Guardians have accepted the tender of Pinching & Walton for six dozen "Z" lamps, 50 c.p. 240 volts, at 36s. per dozen, also six dozen lamps, 16 c.p. 240 volts, at 39s. per dozen.

Keyasham Council have accepted the tender of the local electric light company for continuing the lighting of the present number of lamps, and new lights are to be considered where a recommendation is brought forward by the Lighting Committee.

Walsall Council have accepted the tender of the Rees Roturbo Mfg. Co. (at £1,295. 3s.) for supplying and erecting pumps, motor and electrical equipment required at the sewage disposal works. Nine other tenders were received.

St. Helens Council have accepted the tender of Ferranti Limited for switchgear for 2,000 kw. turbo-alternator and that of Babcock & Wilcox for a steel chimneystack.

Stockport Council have accepted the tender of McClure & Whitfield for alterations of the electric light installation at Hollywood Park Schools.

Hornsey Council have accepted the tender of E. Lawrence & Sons (£3,513) for work in connection with the extension of the electricity station buildings.

Stepney (London) Council have accepted the tender of G. Weston & Sons for wiring the St. George's Town Hall at £272.

Richmond Council have placed an order with Jas. Simpson & Co. for a duplicate electric pumping plant at Petersham Well for £124.

Doncaster Electricity Committee have placed an order with Willans & Robinson for a steam generating set.

Blackburn Council have placed orders with the British Westinghouse Co. for a 2,000 kw. turbo-generator and two rotary converters, and with John Stirk & Sons for a lathe.

"Indian Engineering" hears that the D.P. Battery Co. have an order for supply of 504 13-plate and 1,320 17-plate accumulators for the North-Western (India) State Railway.

BUSINESS NOTICES.

The Benjamin Electric (Ltd.) announce that Mr. Guy Campbell, formerly sales manager of Holophone (Ltd.) has joined their company. New offices and show rooms have been opened at 117, Victoria-street, Westminster, S.W., but the works and warehouse remain at 1A, Rosebery-avenue, E.C., as before. The Benjamin Co. have purchased the stock and goodwill of Mr. C. F. Trippe, of 36, Brooke-street, Holborn, and all communications should be sent to the new offices, at 117, Victoria-street, S.W. The Benjamin Co. intend to manufacture (among other products) specialities necessary for efficient industrial lighting.

Messrs. Baxendale & Co., Miller-street, Manchester, inform us that their business has been registered as a private limited company, and will in future be carried on under the style of Baxendale & Co. (Ltd.) This step has been taken for purely family reasons, and the limited company will consist solely of the partners in the firm, who will devote to the management and the interests of the concern the same attention as hitherto.

The Newcastle-on-Tyne offices and stores of Messrs. Gent & Co. have been removed to 52, Blackett-street.

The Prescot works of the British Insulated & Helsby Cables (Ltd.) will be closed from noon Saturday, Aug. 5, to 8 a.m. Monday, Aug. 14, for the annual overhaul, and the Prescot offices will be closed from noon Saturday, Aug. 5 to Wednesday, Aug. 9.

Patents Development.—The owner of patent No. 16,183/1908, for "Improvements in or relating to telephony and telegraphy," desires to negotiate for the granting of licences thereunder. Particulars from Messrs. Lloyd Wise & Co., chartered patent agents and consulting engineers, 46, Lincoln's Inn Fields, London, W.C.

The proprietor of patent No. 13,163/1905 for "Improvements in dynamo electric machines," desires to dispose of the patent rights or to negotiate for the granting of licences. Particulars from Messrs. G. F. Redfern & Co., patent agents, 15, South-street, Finsbury, London, E.C.

The proprietors of patents No. 18,408/1906, for "Improvements in electric insulators for high-tension conductors," and No. 23,878/1900, for "Improvements in process of and mechanism for separation of conductors from non-conductors" desire to enter into arrangements for exploiting same in this country. Applications to Messrs. Haseltine, Lake & Co., Patent Agents and Consulting Engineers, 7 and 8, Southampton-buildings, Chancery-lane, London, W.C.

The proprietor of patent No. 10,577 (1908), relating to "Alternating current regulators, more particularly for incandescent lamps," desires to license British manufacturers to work same in Great Britain. Applications to Messrs. Boult, Wade & Tennant, patent agents, 111-112, Hatton-garden, London, E.C.

Reduction in Prices of Wires and Cables.—The India Rubber, Gutta Percha & Telegraph Works Co. have issued a circular notifying that the prices quoted in their price list No. 40 (of Oct., 1910) for Association grade 2,500 megohms, 600 megohms, 300 megohms, 600-volt, C.M.A. and Association pure india rubber flexibles are subject to 27½ per cent. discount as from July 10.

W. T. Henley's Telegraph Works Co. announce that they have made substantial reductions of the prices in their trade list.

We are informed that all the firms belonging to the Cable Makers' Association are making similar reductions.

Imports.—The following are official values of electrical machinery, material and apparatus imported into this country (*a*) during June, 1911, and (*b*) during the current year from Jan. 1 to June 30, with the increases or decreases compared with the corresponding periods of 1910:—

Electrical machinery (*a*) £83,724 (increase £37,374), (*b*) £545,302 (increase £265,870); telegraph and telephone cables (*a*) £26,241 (increase £15,073), (*b*) £188,666 (increase £116,219); telegraph and telephone apparatus (*a*) £15,599 (increase £1,175, (*b*) £79,827 (decrease £9,275); other electrical wires and cables, rubber insulated (*a*) £7,545 (decrease £22,778), £43,403 (decrease £55,912); with other insulations, (*a*) £2,401 (increase £663), (*b*) £18,430 (increase £3,855); carbons (*a*) £7,835 (decrease £2,338), (*b*) £63,941 (decrease £4,092); glow lamps (*a*) £15,247 (decrease £26,508), (*b*) £153,755 (decrease £115,810); arc lamps and electric searchlights (*a*) £156 (decrease £96), (*b*) £753 (decrease £1,048); parts of arc lamps and searchlights (other than carbons), (*a*) £9,273 (increase £3,878), (*b*) £55,613 (increase £19,970); primary and secondary batteries (*a*) £2,560 (decrease £763), (*b*) £22,453 (increase £1,882). Total of electrical goods and apparatus, other than machinery and telegraph and telephone wire (*a*) £98,990 (decrease £29,305), (*b*) £688,520 (decrease £32,307).

Exports.—The exports of electrical machinery, material, &c. (*a*) during June, 1911, and (*b*) during the current year from Jan. 1 to June 30, and the increases and decreases compared with the corresponding periods of 1910, are as follows:—

Electrical machinery (*a*) £133,308 (decrease £17,402), (*b*) £831,615 (increase £112,192); telegraph and telephone cables (*a*) £71,921 (increase £42,148), (*b*) £367,880 (decrease £532,214); telegraph and telephone apparatus (*a*) £22,860 (increase £6,756), (*b*) £132,397 (increase £50,430); other electrical wires and cables, rubber insulated (*a*) £37,139 (increase £10,156), (*b*) £204,005) increase £4,642); with other insulations (*a*) £26,947 (decrease £4,040), (*b*) £193,400 (increase £48,409); carbons, (*a*) £1,024 (decrease £225), (*b*) £9,422 (increase £760); glow lamps (*a*) £12,366 (increase £1,044), (*b*) £77,756) (increase £14,939), arc lamps and searchlights, (*a*) £2,395 increase £741), (*b*) £10,131 (increase £711); parts of arc lamps and searchlights (other than carbons) (*a*) £1,780 (increase £752), (*b*) £8,056 (increase £1,317); primary and secondary batteries (*a*) £9,410 (decrease £2,439), (*b*) £69,489 (inecease £16,323). Total of electrical goods and apparatus, other than machinery and telegraph and telephone wire, (*a*) £236,287) increase £68,121), (*b*) £1,354,433 (decrease £338,361).

BANKRUPTCIES, LIQUIDATIONS, &c.

The first meeting of creditors of Cuthbert Fenton Lindop, electrician, lately trading at 62, Dale-street, Liverpool, will take place on July 19 at 35, Victoria-street, Liverpool, and the public examination on July 24 at the Court House, Victoria-street, Liverpool.

A meeting of the creditors of Wm. Tully, mica merchant, 16, Water-lane, Gt. Tower-street, E.C., was held on 5th inst. The statement of affairs showed unsecured liabilities £466, assets £44. O.R. continues to act.

A meeting will be held at 11, Ironmonger-lane, London, E.C., on Aug. 9 to receive an account of the winding-up of the Electro-Peat Coal Co. (Ltd.)

A meeting will be held on Aug. 14 at 2, Coleman-street, London, E.C., to receive an account of the winding up of the Buchholtz Reversible Turbine Synd (Ltd.) (In liq.)

Digitized by Google

COMPANIES' MEETINGS AND REPORTS.

BOMBAY ELECTRIC SUPPLY & TRAMWAYS CO. (LTD.)—The report for 1910 states that the total revenue for the year (including amount represented by sale of current to the tramways) was £219,317, an increase of £21,469. The total expenditure amounted to £192,139, an increase of £7,007. The net receipts from the year's working (£97,177) showed an increase of £14,482, or 17·5 per cent. After deducting £32,383, proportion of debenture interest chargeable to revenue, and £629, appropriated to sinking fund in lieu of interest on debenture stock cancelled in 1909 and 1910, there remains £64,164, which with £4,567 brought forward makes £68,731. The directors recommend that £15,000 be placed to depreciation and £6,000 to sinking fund for capital redemption, carrying forward £11,748. The traffic receipts from the tramways amounted to £144,182, against £134,153. The working expenses in Bombay amounted to £73,488, compared with £70,596, leaving a balance of £73,222, compared with £65,918. Of the 10 new single truck cars which it was decided to construct last year, six were brought into operation before the close of the year, the remaining four being completed early this year. The directors have decided to add 12 more single truck cars during the present year. The gross receipts from electricity supply (including sale of current to tramways) amounted to £66,921, compared with £57,552. The working expenses were £43,897, against £40,934. The balance of £23,024 compares with £16,618 for 1909. The Bombay Municipal Council has agreed to a tariff of flat-rate charges for the supply of electrical energy to all consumers, except for power purposes, in substitution for the maximum demand system. The work of erection and equipment of the generating station at Kussara has been proceeded with, and it is expected that the new power house will shortly be completed. The capital expended during the year in connection with the new Kussara power station, on new mains and the further equipment and improvement of the tramways amounted to £129,882.

CORDOBA LIGHT, POWER & TRACTION CO. (LTD.)—At an extraordinary meeting on Wednesday it was decided to increase the capital of the company to £1,000,000 by the creation of 200,000 new shares of £1 each. The chairman (Sir Irving Courtenay) said it was not the board's intention to issue shares, but they proposed to make use of the further borrowing powers which the increase of the share capital would automatically give them to raise the money required in the course of the next few months or so by means of short-dated notes. The business gave promise of such results after the new hydraulic installation of the Light and Power Company was in full working and the tramways were now completed that they were not disposed to load the company with further long-dated debenture debt. They considered it more advantageous to be able to review the situation in the course of a few years' time. The new tramway concession accounted for the greater part of the increase in the money required, as they wanted further plant and rolling stock for the larger service. They had provided all the reserve steam plant which the concession definitely called for up to April 1, 1914, but the Government were entitled to insist upon the installation of certain further steam plant when they thought it was required. In view of the rapid expansion of the business and the fact that in time of severe drought they would not be able to supply all their customers with their present steam plant, they had decided to anticipate the requisition of the executive and install further plant now. The combined results of the subsidiary companies for the year to March 31 compared with those of the previous year gave an increase of £6,000 in the surplus over working expenses, in spite of an additional expenditure of some £15,000 on the working of the steam plant.

ELECTRIC CONSTRUCTION CO. (LTD.)—The net profit for the year ended May 31, after payment of £7,612, 18s. 6d. for debenture interest and crediting £5,000 as formerly to depreciation account, is £15,041, 17s. The sum brought forward is £6,416, 9s. 8d., and the amount available for distribution is therefore £21,458, 6s. 8d. The directors recommend payment of the dividend of 7 per cent. on the preference shares (£4,294, 12s.), a dividend of 2½ per cent. on the ordinary shares (£5,625), transfer to general reserve (which will then amount to £25,000) of £5,327, 8s., leaving £6,131, 6s. 8d. to be carried forward. The directors are pleased to report a better demand for electrical machinery, and a marked increase in net profit during the past year. Little improvement has taken place in prices, but, in consequence of the increased volume of business, the costs of production have been reduced, and if the present demand be maintained the directors view the future with confidence. During the year a portion of the company's holding in the Madras Electric Tramways (1904) (Ltd.) was disposed of and part of the proceeds applied in redeeming the balance of £10,000 of the second mortgage debenture stock and £17,300 of the first mortgage debenture stock. The net deficit arising from these transactions has been debited to general reserve. The reduction of the debenture stock, besides strengthening the financial position, has effected a considerable saving in standing charges.

GREENWOOD & BATLEY (LTD.)—At the meeting on Saturday the chairman (Major-Gen. E. Micklem) said that the first half of the past year showed a very poor margin of profit, but in the second half of the year they made a fair profit in the face of great competition, although not sufficient to prevent the results for the whole year being somewhat disappointing. The textile, tool, electrical and turbine departments had all turned out a fair amount of work, while there was a satisfactory increase in the orders received in other departments. The total orders received were about £17,000 in excess of those received in 1909-10, while the total sales were about £43,000 in excess of that year.

ELECTRICITY SUPPLY TABLES AND DATA.

This Valuable Set of Tables and Engineering Data relating to Electricity Supply and to Electric Traction on Railways and Tramways in the United Kingdom, the Colonies, and some important places abroad, is now ready, and can be obtained complete in handy book form, price 6s. 6d. post free, or on very hard paper for rough or constant use, price 8s. 6d. post free. A complete Index is included.

JAMES KEITH & BLACKMAN CO. (LTD.)—At the meeting on Wednesday the directors reported that for the year ended March 31 the amount of business done was considerably in excess of that of any previous year. After providing for debenture interest and making sufficient allowance for depreciation and reserves against doubtful debts, the net profit was £10,556, making with balance forward (£2,389) £12,946. In addition to the preference dividend an ordinary dividend was declared of 6 per cent., £5,000 was placed to reserve, and £2,081 carried forward. The continued growth of the business necessitated further extensions at both works, and additional capital will be required. Shares are offered to the existing shareholders.

MARCONI'S WIRELESS TELEGRAPH CO. (LTD.)—The directors' report for the year ended Dec. 31, 1910, states that during the year the company's business has shown considerable extension, the gross trading profit for the year having amounted to £127,452, 13s. 1d. and the nett profit to £60,513, 0s. 3d. The directors do not think it prudent to continue to set out the figures in the form submitted in 1909. The large sum due from the Canadian Company remains to their debit, and the arrangements contemplated this time last year, which would have enabled that company to liquidate its indebtedness, were deferred owing to the prosecution in the United States of directors and officers of the United Wireless Telegraph Co., which for the time being disturbed the financial atmosphere in all matters concerning wireless telegraphy throughout the North American continent. This prosecution recently concluded with the conviction and sentence of the accused. The total par value under the heading "Patents and shares and debentures in Associated Companies" stands in comparison with last year at a reduced figure. This is due to a reduction in the face value of the shares in the Marconi Wireless Telegraph Co. of America. The number of shares, however, remains the same, and this Company's interest in the American Company is unchanged. The amounts appearing in the balance sheet at the end of the year under "Loans from bankers and sundry creditors" have since been mostly, and are about to be entirely, paid off, except as regards current trading accounts.

The successful working of the trans-Atlantic service has demonstrated beyond question the great practical value of wireless telegraphy for long-distance telegraph service. Application has been made by Commendatore Guglielmo Marconi on behalf of this Company for patents for a new, and what is believed to be a very valuable, invention, consisting of a new duplex system adapted to wireless telegraphy. This invention has been submitted to a practical and thoroughly successful test at the Clifden trans-Atlantic station.

In the early part of 1910 the directors commenced an action against one of the infringing companies, resulting in a declaration of the validity of the Company's patent No. 7,777. This patent is of paramount importance, embracing syntonisation, and with it dated the real practical commercial utility of wireless telegraphy. The directors are advised and believe that no wireless station of any practical utility can be erected without infringing this patent. It will be the policy of the directors vigorously to maintain your rights both at home and abroad. As a result of this action substantial benefit accrues to the Company in the form of compensation and in other ways.

Shareholders will have appreciated the significance of the resolution adopted at the Imperial Conference to construct an Imperial chain of wireless telegraph stations. The business of the Associated Companies continues to show marked improvement, and will continue to develop with the ever-increasing application of wireless telegraphy. An important contract has been entered into with the Canadian Government, by which the Canadian Company will work under a considerable subsidy a large number of coast stations in Canada and be entitled to retain also the whole of the telegraph receipts therefrom. The Argentine Company will proceed with the erection of a long-distance station to communicate with Europe, and every endeavour will be made and all assistance given by this Company to assure its early completion.

It is confidently anticipated that the large sums of money which in the past have been expended by this Company in experimenting and developing long-distance wireless telegraphy will be well rewarded. This Company alone has succeeded in erecting long-distance stations able to conduct day and night commercial wireless telegraph service. The future policy of the Company lies mainly in this direction, and negotiations of an important nature are pending to erect and work, or be interested in the working of a chain of wireless telegraph stations around the world. Numerous negotiations are pending with Governments, and some important agreements have been entered into; the directors consider, however, that it would not be in the interests of the Company to give further information upon this subject at this moment.

The Belgian Company has paid dividends for the year, 1910, amounting to 50 fr. per capital share (10 per cent.) and 24 fr. per founder share. The French Company has paid a dividend for the past year of 5 per cent. The Marconi International Marine Communication Co., whose business also is growing extensively, has declared for the year, 1910, its first dividend at the rate of 5 per cent. This Company owns 200,182 fully-paid shares in the International Company of a total capital issued of 204,056 shares.

Digitized by Google

Owing to the strenuous competition and other circumstances which obtained in Germany an agreement has been entered into by the Belgian Company, with this Company's consent and approval, under which all the mercantile vessels in Germany flying the German flag, fitted with either the Telefunken or Marconi system, were transferred to a new company entitled the Deutsche Betriebsgesellschaft für Drahtlose Telegraphie m.b.H. Neither this Company nor the Telefunken Company will in future fit any mercantile vessels flying the German flag; this business will be carried on exclusively by the new company, who now hold the licences from both the Telefunken and Marconi Companies for this purpose; the system installed will be known as the "Debeg." The arrangement embraces the German mercantile marine only. The Belgian and the Telefunken Companies hold the shares of the "Debeg" Company, and the board is composed of members of those two companies and include Commendatore G. Marconi and Mr. G. C. Isaacs. The Company's business generally continues to show substantial increase, and the directors have pleasure in recommending payment of the cumulative 7 per cent. dividend upon the preference shares to the end of 1910, which will absorb £16,599. 13s. 2d. There will thus remain to the credit of profit and loss account £49,119. 4s. 8d., which will allow of, and the directors will recommend, the declaration of a dividend on the ordinary shares. Subject to the approval by the general meeting of the payment of dividend on the preference shares, it is the intention of the directors to immediately declare an interim dividend on the preference shares for the half-year ending June 30 at the rate of 7 per cent.

Since the last meeting, Commendatore G. Marconi has resigned his position as joint managing director and Mr. Godfrey C. Isaacs was appointed sole managing director. The lamentable death of Sir Charles Euan-Smith left a vacancy on the board. Mr. Hammersley Heenan retires by rotation, but as his business occupations at a distance from London do not allow of his devoting such time to the Company's business as he would desire, he does not offer himself for re-election. Col. Albert Thys and M. Maurice Travailleur, for years intimately associated with the Company's business, have been elected members of the board.

MELBOURNE ELECTRIC SUPPLY CO. (LTD.)—At an extraordinary meeting on Monday a resolution was passed authorising the directors to raise any sum of money not exceeding £100,000. Additional capital is necessary owing to the rapid increase in the applications for light and power.

NEW COMPANIES, STATUTORY RETURNS, MORTGAGES AND CHARGES, &c.

NEW COMPANIES.

HALLS, BUILDERS (LTD.) (116,633.)—Reg. July 4, capital £1,000 in £1 shares, to take over the business of builders and decorators carried on as Hall & Co., and the business of electrical engineers carried on by C. Wainwright. Private company. First directors: A. C. Edwards and H. H. Trendler. Reg. office: 5, Blackstock-road, Finsbury-park, London, N.

LAUNCESTON & DISTRICT ELECTRIC SUPPLY CO. (LTD.) (116,654.)—Reg. July 5, capital £10,000 in £1 shares, to carry on at Launceston and elsewhere in Cornwall the business of an electric light company in all its branches. First directors: C. H. Gillbard, T. B. Hender, J.P., J. Kittow, W. Prockter, J.P., R. B. Rogers, W. H. Symons and T. P. Trood, J.P. Office: Westgate, Launceston.

METAL DEPOSITING SYND. (LTD.) (116,614.)—Reg. July 3, capital £1,500 in £1 shares, to carry on the business indicated by the title and that of founders, engineers, metal workers, &c., and to adopt an agreement with H. A. Harvey and G. P. M. Lee. Private company.

STATUTORY RETURN.

UNION ELECTRIC CO. (LTD.)—Return to May 18 gives capital as £25,000 in £1 shares. 24,250 shares taken up. £1 per share called up on 4,250 and 1s. per share on 19,500. £5,225 paid. £500 considered as paid on £500 shares. Mortgages and charges, nil.

MORTGAGES AND CHARGES.

GILBERT ARC LAMP CO. (LTD.)—Mortgage, dated June 30, to secure £500 and further advances, charged on company's book debts. Holders: Engineering & Arc Lamps (Ltd.).

IMESON, FINCH & CO. (LTD.)—Debenture, dated June 28, to secure £800, charged on company's undertaking and property, including uncalled capital. Holders: Hanson, Brown & Co.

RUSHMORE LAMPS (LTD.)—Particulars of £2,000 debentures, created April 3, 1911, have been filed, amount of present issue being £1,000. Property charged: Company's undertaking and property, present and future. No trustees.

SIMMS MAGNETO CO. (LTD.)—Issue, on May 31, of £2,500 debentures, part of a series of which particulars have already been filed.

STANIAR, CLEGG & CO. (LTD.)—Debenture, dated June 13, to secure £170, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: H. D. Staniar.

RECEIVERSHIP.

KRAMOS (LTD.)—S. P. Jackson, C.A., Bank-chambers, Bath, ceased to act as receiver and manager on July 3

CITY NOTES.

MEMORANDA (July 13).—Bank rate 3 per cent. (March 9, 1911.) Price of silver, 24⅜d. per oz. Consols 78½—78¾ for money and for account. Consols Pay Day, Aug. 2; Stock and Shares Continuation Days, July 26 and Aug. 14; Ticket Days, July 27 and Aug. 15; Pay Days, July 14 and 28; Mining Shares Carry Over Day, July 25.

PRICES OF METALS (London).—*Copper*, cash, 57⅛; three months, 57⅜. *Lead*, English, 13⅝—13¾; Foreign, cash, 13⅝—13⅞, three months, 13⅝—13¾. *Spelter*, 24¼—25. *Tin*, English, 192—194; Foreign, cash, 195¼; three months, 188—188¾. *Iron*, Cleveland, cash, 46/10½, three months, 47/7½.

AN ELECTRICAL COMBINATION.—A powerful combination of financiers, contractors and electrical engineers has, we are informed, been effected to undertake the finance, design, construction and operation of large electrical works in all parts of the world. Among those interested are leading French and English institutions. The London board of management consists of Messrs. J. Norton Griffiths, M.P. (president), E. P. Powles, R. D. McCarter and J. Kerr Bock. The name of the company is Griffiths Electric Contractors (Ltd.). The London agents are at Griffiths House, London Wall, E.C., with branch offices in East and, West Canada, South America, Australia, New Zealand, South Africa, Spain, Turkey, &c.

BOURNEMOUTH & POOLE ELECTRICITY SUPPLY CO. (LTD.)—The directors have declared an interim dividend on the 4½ per cent. preference and 6 per cent. second preference shares, and also an interim dividend on the ordinary shares at the rate of 5 per cent. (less tax) for the half-year ended June 30.

CITY & SOUTH LONDON RAILWAY CO.—The accounts for the half-year ended June 30 last show a balance after providing for debenture stock interest, dividend on preference stock, and the transfer to renewal fund of £1,500 and £800 for general purposes, sufficient to allow the payment of a dividend on the consolidated ordinary stock at the rate of 1¾ per cent. per annum, carrying forward £2,798. The dividend for the corresponding period last year was at the rate of 1¼ per cent. per annum, carrying forward £1,634.

Mr. J. F. S. Gooday, late general manager of the London, Brighton & South Coast and Great Eastern Railways (and now a director of both companies), has been elected a director of the City & South London Co.

CLONTARF & HILL OF HOWTH TRAMROAD CO. (LTD.)—An interim dividend has been declared at the rate of 3 per cent. per annum (3s. per share) for the past half-year.

DIRECT UNITED STATES CABLE CO. (LTD.)—The board have resolved to pay a final dividend of 2s. per share, together with a bonus of 1s. per share (both tax free), such dividend and bonus to be payable on and after 31st inst., and making with the three interim dividends already paid, a total distribution of 5 per cent. for the year ended June 30. The transfer books will be closed from 11th to 25th July inclusive.

EASTERN EXTENSION AUSTRALASIA & CHINA TELEGRAPH CO. (LTD.)—Interest on this company's 4 per cent. mortgage debenture stock for the half-year ending 31st inst. will be paid by warrant on Aug. 1. The stock register will be closed from 27th to 31st inst. inclusive.

KALGOORLIE ELECTRIC TRAMWAYS (LTD.)—This company's traffic receipts for June were £3,649 and the aggregate from Jan. 1 is £20,464.

MEXICO TRAMWAYS CO.—The directors have declared a dividend of 1¾ per cent. for the quarter ended June 30.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO. (LTD.)—The directors have resolved to pay interim dividends of 2½ per cent. on the Preference shares and 2 per cent. on the Ordinary shares.

STOCK EXCHANGE NOTICES.—The Stock Exchange Committee have appointed July 20 a special settling day in $850,000 5 per cent. bonds, 1925 (London issue) of the *Bell Telephone Co. of Canada* (*Ltd.*), and have granted quotations to $2,000,000 capital stock of the *Kaministiquia Power Co.* (*Ltd.*), £1,188,300 5½ per cent. first mortgage debentures of the *Lima Light, Power & Tramways Co.* (*Las Empresas Electricas Asociadas*), a further issue of $600,000 7 per cent. cumulative preference stock of the *Mexican Light & Power Co.* (*Ltd.*), and a further issue of £21,000 4½ per cent. first mortgage prior lien gold bonds of the *Montreal Water & Power Co.* The Committee have been asked to appoint special settling days in and grant quotations to £100,000 5 per cent. debenture stock of the *Adelaide Electric Supply Co.* (*Ltd.*) and fully and partly paid scrip for $3,500,000 first mortgage 5 per cent. 40-year Gold bonds of the *Mississipi River Power Co.*, and to grant quotations to a further issue of £30,000 5 per cent. second mortgage debentures of the *Bombay Electric Supply & Tramways Co.*, a further issue of £200,000 5 per cent deferred ordinary, £200,000 preferred ordinary and £200,000 5 per cent cumulative perpetual preference stock of the *British Columbia Electric Railway Co.* (*Ltd.*), $285,500 first mortgage 33-year sinking fund gold bonds of the *Cascade Water, Power & Light Co.* (*Ltd.*), £441,620 5 per cent. first mortgage convertible bonds of the *Cuban Telephone Co.*, and $5,664,200 additional common stock of the *Mexico Tramways Co.*, and 467,000 £10 fully-paid shares of the *Underground Electric Railways Co. of London* (*Ltd.*).

TELEGRAPH CONSTRUCTION & MAINTENANCE CO. (LTD.)—The transfer books will be closed from 10th to 20th inst. inclusive, preparatory to payment of interim dividend of 12s. a share.

NOTES.

Testing Induction Motors.

Many motors, especially large motors, built at the present time, are of the induction type with slip-rings. The reasons for this are many and weighty. Such machines can be safely built for high pressures, they give no trouble at starting nor when running, and they are very efficient over a wide range of load. A simple method of measuring the efficiency of such machines, therefore, is very desirable, especially when only one unit is available. Now it frequently happens that though the necessary supply is at hand, suitable means of absorbing the power are wanting. Arranging a dynamometer or brake is not always an easy matter, especially on site, nor is it always sufficiently accurate to absorb the power by driving an electric generator.

In such cases it is possible to take advantage of the transformer properties of the induction machine and absorb the power supplied to the stator by loading the *clamped* rotor electrically. Corrections are necessary, of course, to allow for the mechanical losses and the increased copper and iron loss. In our present issue we publish a short article in which Mr. H. J. S. Heather points out the possibility of using such a method and describes how the corrections are made. Though the author does not deal with the problem exhaustively, nor append comparative test results, the necessary refinements will at once be clear to those conversant with the working of these machines, and we have no doubt that such a method can be made to do reliable service.

The Education Estimates.

In introducing the Education Vote last week in the House of Commons, Mr. Runciman seemed by no means cheerful as to the position of technical education in this country; in fact, he stated that in his opinion it was in the field of higher technology that we had most leeway to make up. Nevertheless, he had to admit that a number of large bequests had been made during the past year and this certainly must be taken as a most important preliminary step to efficient education. For example, the University of Liverpool has recently founded a professorship of naval architecture and a department for the study of problems in town planning. The study of aeronautics has not been neglected and a professorship has been founded at Leeds for the study of questions connected with the gas, coal and fuel industries, and the Clothworkers' Company has given £50,000 to the University at Leeds to provide instruction in wool combing and spinning. Further, in the North of England £35,000 has been applied to the teaching of mechanical engineering, and in three universities sums of £30,000, £50,000 and £70,000 respectively have been provided for the promotion of chemical science. Without wishing to minimise in any way the gratitude which all should feel towards these generous donors for their efforts to help on education, we cannot help thinking that the Government themselves might do more, or rather might give more, than they do at present. A matter of national importance should not depend so much on private individuals.

Although there is much yet to be done we think it will be admitted that the above are satisfactory signs of an

Digitized by Google

awakening to the value of technical education, but what appeared to trouble Mr. RUNCIMAN most was the fact that there are only 16,000 students in the universities of England as compared with 63,000 students in similar institutions in Germany. Even taking into account the difference in the population there is no doubt that these numbers do not compare satisfactorily, assuming that the figures are strictly comparable. On the other hand, it must not be forgotten that a certain amount of education is necessary to teach the public fully to realise the advantages of technical education. Further, as pointed out by Sir PHILIP MAGNUS in the debate, the higher technical institutions of Germany have been established for much longer than the similar institutions in this country. Moreover, there has always been a lack of funds, and in this connection there may be a good deal in the view expressed by Sir PHILIP MAGNUS that the Board of Education should take steps to ensure that grants to secondary schools should not be given exclusively to the pupils, but some part should go to increasing the income of the schools. It is also worthy of note that the Treasury grants to universities will, in future, be administered by the Board of Education. This makes the Board the only Government Department to deal with the universities. In order that the grants may be properly administered a small advisory committee has been appointed, and we hope that they will approach their work with more open-mindedness than has always been the case in the past.

General Electric Progress.

THE annual meeting of the General Electric shareholders took place on Monday. The directors' report which was presented to the meeting contained many points of interest to electrical engineers, and was submitted with all the cheery optimism of the chairman (Mr. HUGO HIRST). He fittingly referred to the late chairman and founder of the company, Mr. GUSTAV BYNG. It is quite clear that much of the success of the General Electric Company's work is due to Mr. BYNG'S early efforts. His place on the board has been filled by the appointment of one of his sons. It is satisfactory to note, turning to the balance-sheet, that the trading profits amount to £107,858, an increase of £16,728 over last year's working, and that good-will and patents have been written down to £1. The company has continued its old policy of financing manufacturing concerns by investing its surplus funds in concerns which act as feeders to the general business. In this way the British General Electric Companies of China and Australia have recently been founded and financed, and it is foreshadowed that similar undertakings will soon be established in India and the Argentine.

PERHAPS the most interesting point in the directors' report is that which deals with the National Insurance Bill. The scheme of contributions by employers outlined in that Bill must prove a serious matter to all large manufacturing and distributing firms and one which will require careful consideration. Ethically an employer is to some extent responsible for his employes, and the General Electric Co.'s directors are able to support this view, notwithstanding the heavy charge it entails. Mr. HIRST, in the course of his remarks, said the Bill would "carry in its train benefits which will improve the discipline, independence, character and happiness of the working people, and therefore will be worthy of sacrifice on the part of every section of the community." This is a statement of the case which we can but hope the future will justify.

Provisional Electric Lighting Orders.—The Board of Trade have issued their report respecting the applications to and proceedings of the Board under the Electric Lighting Acts, 1882 to 1909, during the past year.

There were 28 applications for orders (11 by local authorities and 17 by companies or persons), butt wo applications (by Bognor Urban Council and Uxbridge and District Electric Supply Co.) were not proceeded with. In the case of the application of Bermondsey (London) Borough Council for an order for the remaining portion of the Borough an inquiry was held by the Board, and after consideration of all the circumstances of the case they refused to grant the order. The local authority refused to consent to the application of the New Electricity Co. of Macclesfield for Macclesfield borough, and after consideration of the circumstances the Board dispensed with the consent, and granted the order. In all other cases the applications were granted (either for the whole or part of the scheduled areas), and confirmatory bills were introduced.

The bills to confirm the provisional orders granted by the Board of Trade last year were passed, and all received the Royal Assent.

Since the date of the last report the Board have approved deeds transferring the powers, duties and liabilities of five orders, viz., the Caerphilly, Church, Dawlish, Dunfermline and District and Southgate Orders.

The Board have given their consent under sec. 2 of the Electric Lighting Act, 1909, to the construction of generating stations on certain specified land for the purposes of six orders (Bispham, Carmarthen, Dawlish, Glasgow, Llanelly and Swinford); and the Board have also made 23 orders under sec. 6 of the same Act permitting the undertakers to supply electrical energy to certain specified premises outside their prescribed areas of supply.

No applications for licences have been entertained by the Board since the date of the last report.

Telephone Administration.—Correspondence has passed between the Liverpool Cotton Association and the Postmaster-General in regard to a scheme for the creation of a central advisory committee in connection with the future management of the telephone and telegraph services of the country. It was proposed that this advisory committee should consist of representatives of the chief commercial bodies of the United Kingdom, and that it should be under the chairmanship of the Postmaster-General.

In a letter dated June 21st, the Secretary of the G.P.O. (Sir Matthew Nathan), on behalf of the Postmaster-General, states that Mr. H. Samuel is of opinion that a small advisory committee would fail to be completely representative of all the special interests which should be kept in view in the administration of the telephone and telegraph services, and that a thoroughly representative committee would be so large as to make it impossible to ensure full consideration of the numerous questions in which the majority of the members would not be directly interested. On the other hand, the Postmaster-General sees no serious difficulty in securing the objects which the Liverpool Association have in view by the adoption of a proper system of administration by the Post Office. On several occasions recently he has explained his intention of decentralising the administration of the telephone service, and of entrusting responsible officers in different parts of the United Kingdom with a considerable measure of executive control. It will be the duty of these officers to keep in touch with commercial bodies and with local authorities in their provinces and districts, and it will therefore always be possible to secure free discussion between representatives of the Post Office telephone service and the bodies who may require special developments of the service to meet their needs. Commercial bodies, such as the Liverpool Cotton Association, Chambers of Commerce, Chambers of Trade, Chambers of Shipping, or the Committees of Stock Exchanges, will thus have frequent opportunities of making special representations, and whenever necessary the assistance and advice of local committees will be sought in dealing with problems in which they are concerned. Their views will always receive full consideration by the Postmaster-General, and, if necessary, can be personally discussed with him, or with the principal officers of the Post Office. In this way a simple and effective method of dealing with all special requirements may be arranged without difficulty, and Mr. Samuel therefore considers it unnecessary to appoint a general advisory committee, or to ask the House of Commons to hold a special inquiry on the subject.

The Liverpool Association has accepted the situation outlined in this reply.

Medico-Mechanical Institute.—Mr. Edgar Allen (of Edgar Allen & Co., Ltd.) has presented a Medico-Mechanical Institute to the city of Sheffield. The institute has been fitted with a complete set of Zander apparatus, and Mr. Allen will bear the whole cost of maintainence (£1,500 a year) for the next three years. By that time he hopes the institute will be supported with the hospitals, in conjunction with which it will be worked. The institute is intended for the free treatment of wage-earners suffering from limb troubles.

Automatic Telephone Exchanges.—In our last issue we announced that the Post Office proposed to instal an exchange at Epsom working on an automatic system. We have now received the following information from the engineer-in-chief of the Post Office confirming this and amplifying the details. It appears that as a result of visits recently paid to America by the engineer-in-chief and other headquarter officers of the Post Office the Postmaster-General has decided to introduce experimentally into this country some of the systems of automatic exchange working which are now installed in several cities of the United States. Three or four different systems are in use in America and these have all been investigated both in their electrical and economic aspects. The automatic system represents a radical departure from the existing general method of exchange working, and it is felt that in order to keep abreast of telephone progress the time has arrived for giving these systems a practical trial in Great Britain. The mechanical and electrical problems involved have now to a great extent been satisfactorily solved, and it remains to be decided whether such systems will be economical, and further whether they will be popular with the British public. Negotiations are now in hand for the installation of an automatic exchange on the "Stronger" principle at Epsom, and for another on the "Lorimer" system at Caterham. Each of these exchanges will be equipped with about 500 lines at the outset, and will probably be installed within the next six or eight months. The exchange serving the official departments at St. Martin's-le-Grand is also to be converted to the automatic system, and will include about 400 lines. The development of "semi-automatic" exchanges is also being closely watched. These exchanges utilise the ordinary type of subscriber's telephone, as used on the existing common battery manual exchange system, and the method of working is identical so far as the subscribers are concerned. The installation of a trial exchange of the semi-automatic type would merely test the efficiency of the exchange apparatus, and would give no information as to whether the public is prepared to accept, and successfully operate, the full automatic system of working. The experimental equipments about to be installed are expected to yield all the information necessary to determine the future policy of the department.

Current Topics.

Subjects of current interest dealt with in this issue include the following:—

An article by Mr. H. J. S. Heather deals with a new method of determining the efficiency of slip-ring induction motors.

Mr. G. L. Addenbrooke contributes an article on Selenium. or Selenion, as he prefers to call it, by analogy with silicon and boron.

We publish an article dealing with the various phases in the development of the De Laval steam turbine.

In a Paper (of which we give an abstract) read before the Tramways and Light Railways Association, Mr. Gerald Hooghwinkel puts forward some reasons why, in his opinion, electric street traction is not developing in this country at the present time and is not so satisfactory financially as on the Continent.

We continue our account of the Papers and Discussions thereon delivered at the Education Conference recently organised by the Institution of Civil Engineers.

An abstract of an article by Mr. R. Rudenberg on the stability of three-phase machines gives a further account of the researches the author has been making up on this question.

Birmingham Corporation are recommended to purchase the remaining interests of the City of Birmingham Tramways Co. in the local tramways and to obtain powers to construct several additional lengths of line.

Parliamentary.—The Telephone Transfer Bill was read a second time in the House of Commons on Friday.

Standing Committee B of the House of Commons on Wednesday passed, with amendments, Clause 60 of the Coal Mines Bill, which deals with the use of electricity in mines.

Companies' Meetings and Reports.—The report of the directors of the Electric & General Investment Co. sets out an amended scheme for the extinction of the founders' shares.

The directors' report of the South Brazilian Railway Co. states that the company has acquired the local tramways (which are to be converted to electric traction) and also the electricity supply undertaking.

The report of the directors of the City & South London Railway Co. shows a satisfactory increase in the number of passengers carried and in receipts for the half-year to June 30 compared with the corresponding period of 1910, the passengers having increased by 1,000,000 and the receipts by over £4,000. The dividend for the half-year is 1¾ per cent., compared with 1¼ per cent. for the corresponding period of 1910. The vacancy caused by the death of Mr. Harvey Rankin has been filled by the appointment of Mr. J. F. S. Gooday, well known as a former general manager of the Great Eastern and Brighton Railways, and now a director of both those companies.

The accounts of the National Telephone Co. show that the amount paid to the Post Office for royalties for the half-year to June 30, 1911, was £173,424. 7s. Out of the net profits of £436,886. 13s. £200,000 is put to reserve. The company have spent on capital account during the half-year £211,121. 15s. 10d. in the erection of 15,675 additional exchange and private stations and in the construction of underground works. The total income for the half-year is £1,807,871. 13s. 3d., an increase of £129,559. 14s. 10d. over the corresponding period of 1910. The percentage of working expenses to net income was 64·74 compared with 64·09 in 1910, and the highest on record. The rentals carried forward for unexpired terms amount to £1,577,419.

OBITUARY.

R. B. Goodyer.—We regret to report the death, which occurred on the 15th inst., from heart failure, of Mr. R. B. Goodyer, at his house in Newport-road, Cardiff, at the age of 73 years. The late Mr. Goodyer had a long connection with tramway systems, having held managerial appointments with the Edinburgh Street Tramways Co., the Rothesay Tramways Co., the London Road Car Co., the Continental Metropolitan (Paris) Tramways, while for over 20 years he was manager of the Cardiff branch of the Provincial Tramways Co. Mr. Goodyer's son is tramways manager to the Croydon Corporation.

Prof. W. Spring.—The death is announced of Prof. Walter Spring of the University of Liége. The deceased was well known for his researches both in organic and inorganic chemistry.

PERSONAL NOTES.

Mr. Benjamin Deakin, M.I.M.E., M.I.E.E., who for many years occupied a responsible position on the engineering staff of the City and County of London Electric Supply Companies and subsequently as engineer and manager in Australia for the British Insulated & Helsby Cables (Ltd.) and the Electric Supply Co. of Victoria, has joined the firm (with a seat on the board) of Horrocks, Roxburgh, Ppty. (Ltd.), Melbourne, who are agents for Hadfield's Steel Foundry Co., Brown Bayley's Steel Works, William Cooke & Co., of Sheffield, and other firms. Mr. Deakin was the engineer who designed and constructed the Ballarat and Bendigo electric supply and tramway undertakings, from the management of which he has just retired. He is visiting England in the interest of his new firm, and his address in London will be c/o the National Bank, 5, Bishopsgate, London, E.C.

Sir Joseph Swan, F.R.S., has been elected president of the Literary and Philosophical Society of Newcastle-on-Tyne.

Mr. C. W. Hill, manager of the Bournemouth tramways, has tendered his resignation in order to take up a business appointment in London.

APPOINTMENTS VACANT AND FILLED.

A lecturer in electrical engineering is required at the East London College (University of London) for September next. Workshop experience essential. Commencing salary £180. Particulars from Prof. J. T. Morris. Applications to the Registrar of the College by Monday, July 31. See advertisement.

An assistant lecturer and demonstrator is required in the mathematics and mechanics department of Sunderland Technical College,

Digitized by Google

Salary £150. Applications to Mr. Herbt. Reed, 15, John-street-Sunderland, by July 31.

A demonstrator or assistant lecturer is required in the physics department of the University College of Wales, Aberystwyth. Salary £150. Applications to the Registrar by Aug. 24.

Battersea (London) Council require an additional commercial assistant for their electricity department. Salary £2 per week and commission. Applications by noon July 24.

The Governors of Heriot-Watt College, Edinburgh, require an organiser of technical education. Salary £300 per annum. Applications to the Clerk, 20, York-place, Edinburgh, by July 24.

An assistant science master is required for Waterford Central Technical Institute. Salary £100, rising to £130. Particulars from the Principal. Applications by noon, July 29.

Appointment Wanted.—Mr. A. H. Seabrook, general manager of the Marylebone electric supply department, writes as follows:—

Probably many supply engineers have been in the position that I have been in myself in requiring a suitable man for a certain post, and really not knowing where to turn to obtain one. If at the present moment any supply man is looking round for a first-class boiler house and steam plant superintendent, I can recommend to him a man whose capabilities I do not believe can be excelled.

Taunton Council have appointed Mr. Appleby, of Smethwick, assistant engineer at the electricity station in succession to Mr. C. B. Lewis, who is leaving for Australia.

Mr. Hugh Maclean, foreman at the locomotive works of the G.N.S. Railway at Inverurie, has received an appointment with the Chloride Electrical Storage Co. in the Argentine.

Mr. H. Love has been appointed fourth engineer at the Hammersmith electricity works.

INSTITUTIONS AND SOCIETIES.

Royal Society of Arts.—The Council of this Society attended at Clarence House on Friday last, when the president, H.R.H. the Duke of Connaught, K.G., presented its Albert Medal to the Hon. Sir Chas. A. Parsons, K.C.B., F.R.S. As already announced in THE ELECTRICIAN, this medal was awarded to Sir Charles "for his experimental researches into the laws governing the efficient action of steam in engines of the turbine type and for his invention of the reaction type of steam turbine and its practical application to the generation of electricity and other purposes."

Association of Consulting Engineers.—Since the draft rules drawn up by the provisional committee were circulated in December last, a large number of council meetings have been held to deal with points that have been raised by various engineers, and a number of important negotiations have been in progress. It was hoped that these negotiations would have been completed in time to call a general meeting to consider the rules and formally enroll members during the present month. Unfortunately, owing to the large number of interests to be considered and the complexity of the considerations involved, this has been found impossible, but the committee hope to be able to call the meeting after the holidays. Meantime, Mr. Dykes, the honorary secretary, would be obliged if all letters were sent to his new address, 11, Victoria-street, Westminster, S.W.

British Association.—The British Association meeting this year will be held from August 30 to September 6, Portsmouth being the meeting place for the first time in the society's history. In his presidential address to the Association, Sir Wm. Ramsay will deal with the increasing need of scientific training with a view to future as well as to present-day requirements. He will also touch upon the necessity of conserving our national resources. Prof. H. H. Turner will consider, in his opening address to Section A, the lessons taught by the observational sciences, *e.g.*, magnetism, as regards methods of work. Sections A and G will hold a joint meeting for the discussion of "The Problems of Mechanical Flight," which will be opened by Mr. H. E. Berriman, editor of "Flight." In Section B, Prof. McWilliam will present a report on "Electric Steel Furnaces." In Section G there will be a discussion on the respective merits of superheated steam engines, suction gas plants and Diesel engines. Papers on these subjects will be contributed by Captain H. R. Sankey, Mr. Tookey and Mr. C. Day. It is hoped that Prof. G. W. Howe will be able to show some experiments on wireless telegraphy, and that Capt. Sankey will be able to exhibit a portable wireless telegraph equipment. Several Papers relating to ships will be presented, dealing with recent improvements, such as the "Gyro-Compass," by Mr. G. K. B. Elphinstone, "Electrical Steering," by Mr. B. P. Haigh, "Electrical Drives for Ships' Propellers," by Mr. H. A. Mavor, and "Marine Engines adapted for burning Crude Oil," by Mr. J. H. Rosenthal. Other Papers are those on "Smoke Abatement," by Dr. J. S. Owens, the "Origin and Production of Corrugation on Tramway Rails," by Mr. Worby Beaumont, and "The Vibragraph," by Mr. W. P. Digby. Among the social functions which have been arranged are a reception by the Mayor and Mayoress of Portsmouth on the South Parade Pier, and a municipal garden party in Victoria Park. The Bishop of Winchester will preach in Portsea Parish Church on September 3rd, when the President and Council of the Association will attend. H.M. Dockyard will also be visited and there will be a display at the Gunnery School on Whale Island.

New Club House of the Whitehall Club.—An interesting ceremony was performed yesterday (Thursday) at the new building which will, when completed, form the new home of the Whitehall Club. A commemorative stone was laid by Mr. Alexander Siemens, President of the Institution of Civil Engineers, assisted by Mr. E. B. Ellington, President of the Institution of Mechanical Engineers, and Major O'Meara, Vice-President of the Institution of Electrical Engineers. Inserted in the stone was a box containing a number of mementoes of the occasion. Mr. C. Midgley Taylor, chairman of the club, presided over the ceremony, and also took the chair at the luncheon which followed it. About 120 members of the club and their guests sat down to luncheon, the company including Sir Henry Tanner, Sir Robert W. Perks, Mr. G. N. Abernethy, vice-president of the club, and a large number of club members. At the luncheon the presidents of the three Institutions spoke of the useful position of the new building and of the facilities for social intercourse which its accommodation would afford to engineers. Mr. Midgley Taylor, in responding to the toast of the club, said that it had been arranged to elect as honorary members of the club engineers from the Dominions overseas who were recommended to them by the presidents of the professional institutions from which the club made up its own members. This course would ensure an appropriate welcome being extended to prominent men visiting this country from the Colonies. The new building, which is from designs by Mr. H. Chatfeild Clarke, F.R.I.B.A., will accommodate 500 town members. Mr. J. Hodgkin is the secretary of the club, and from him full details of membership can be obtained at 2A, Whitehall-court, London, E.C.

EDUCATIONAL NOTICES.

University of Sheffield.—The faculty of applied science comprises the departments of engineering, metallurgy, coal mining and architecture. The courses in engineering or in metallurgy extend over three years and prepare respectively for the degree of B.Eng. or B.Met. of the university. The lecture courses commence Oct. 4, and the technical laboratory courses on Sept. 18. Prospectuses and other particulars from the registrar, Mr. W. M. Gibbons.

University of Manchester.—Prospectuses giving full particulars of the lectures and laboratory courses in physics preparing for both the ordinary and honours degrees, will be forwarded on application to the Registrar.

City and Guilds Technical College.—This college provides a scientific training for students preparing to become electrical and mechanical engineers or chemists, and for engineering pupils who desire to supplement their practical training by a two years' course of instruction in the principles of engineering science. The instruction is mainly given in the various laboratories, most of which have been recently re-equipped. The subjects of the entrance examination are mathematics and English, but the matriculation of any British University is accepted. The courses in electrical and mechanical engineering cover a period of two years and those in chemistry three years. There are also arrangements for three-year courses in engineering. Particulars at the college, Leonard-street, City-road, London, E.C., or from the City and Guilds of London Institute, Gresham College, Basinghall-street, London, E.C.

In consequence of the rebuilding of Gresham College the head offices of the City and Guilds of London Institute have been removed temporarily to 3, St. Helen's-place, London, E.C.

ARRANGEMENTS FOR THE WEEK.

THE LONDON ELECTRICAL ENGINEERS.

Officer Commanding, Col. H. M. Leaf.

The following orders have been issued for the current week.

Monday, 24th .....
Tuesday, 25th.....
Wednesday, 26th...
Thursday, 27th.....
Friday, 28th .....
} Headquarters will be open from 10 a.m. to 4 p.m.

Saturday, 29th .... Falmouth detachment will parade at Headquarters at 8:30 a.m. Weymouth detachment will parade at Headquarters at 11 a.m. Dress for the above detachments will be: Service dress, drill order, with water bottles and haversacks. Arms will be issued before each parade.

THE STABILITY AND COMPENSATION OF THE THREE-PHASE SERIES COMMUTATOR MACHINE.*

BY R. RÜDENBERG.

Summary.—The author continues his investigations into the characteristics of the series commutator motor with unequal numbers of turns on stator and rotor. The limit of stable speed can be made as low as desired by reducing the number of rotor turns, whilst compensation is obtained by increasing the rotor turns. Both properties only depend on the brush displacement and the ratio of the turns.

In a previous article† the chief characteristics of the three-phase series commutator motor were deduced for an ideal machine. Under the assumption of the same number of effective turns on both stator and rotor, two remarkable results were established, viz., that exact phase compensation only exists at double synchronous speed—below this speed the current would lag, above it, lead—and, secondly, that at low speeds, especially with large brush displacements, there was a

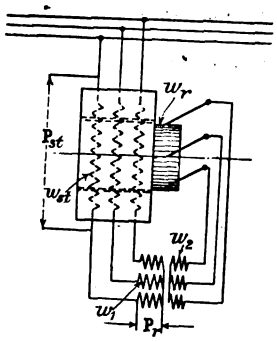

FIG. 1.—DIAGRAM OF CONNECTIONS.

limit of stability for the speed, below which the machine could not work as motor. It was then shown that both these factors could be varied by altering the ratio of stator to rotor turns. To obtain good phase compensation at a lower speed, the number of rotor turns must be increased, whilst to obtain stability at low speeds a decrease in the number of turns on the rotor is necessary.

Taking again the ideal motor, we can now continue the study of these properties by placing an ideal transformer between stator and rotor, as shown in Fig. 1. The effective stator and rotor turns are denoted by w_{st} and w_r, and the primary and secondary turns of the transformer by w_1 and w_2 respectively.

I.—STABILITY.

The working of the motor will depend on the double ratio

$$x=\frac{w_r}{w_{st}}:\frac{w_2}{w_1}=\frac{w_r w_1}{w_{st} w_2}. \quad . \quad . \quad . \quad . \quad . \quad (1)$$

The case $x=1$ corresponds to equal effective turns on stator and rotor. The pressure diagram of the motor is shown in Fig. 2. The

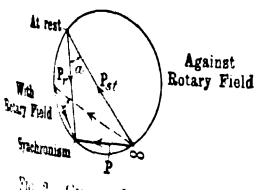

FIG. 2.—CIRCLE DIAGRAM OF PRESSURE.

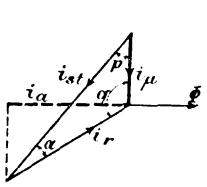

FIG. 3.—CURRENT SYSTEMS IN THE MOTOR.

applied pressure P is the geometric sum of the stator pressure P_{st} and the rotor pressure P_r, which are displaced in phase by the brush angle α, where α is taken from the "short-circuit position," in which the stator and rotor currents directly oppose. The diagram is drawn for $x<1$, so that there are fewer turns in the rotor than in the stator. The rotor pressure is reduced to the external circuit and can be directly measured on the primary side of the transformer. The rotor pressure depends on the ratio x. At rest, $P_r=P_{st}$ when $x=1$. When running, of course, P_r varies with the slip s relative to the synchronous speed n_0 of the motor:—

$$P_r=xP_{st}\cdot s=xP_{st}\left(1-\frac{n}{n_0}\right) \quad . \quad . \quad . \quad . \quad . \quad (2)$$

or

$$\frac{n}{n_0}=1-\frac{P_r}{xP_{st}}. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (3)$$

whence the speed can be directly obtained from the pressure diagram.

The space diagram of the current systems in the machine is shown in Fig. 3, also drawn for $x<1$, the rotor ampere turns denoted by i_r being only x times the stator ampere-turns i_{st}. The two current systems are at the brush angle α and form the resultant magnetising current i_μ which produces the main flux Φ of the motor. It might be pointed out that even with $\alpha=0$ the main flux does not completely vanish, because with

$$i_r=xi_{st} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4)$$

a magnetising current still remains, even when i_r and i_{st} directly oppose one another. In this case, however, Φ is at right angles to the current systems, in space, and cannot produce a torque.

The shape of the current triangle is completely determined by α and x. The magnitude of the magnetising current is then

$$i_\mu=\sqrt{i_{st}^2+i_r^2-2i_{st}i_r\cos\alpha}$$
$$=i_{st}\sqrt{1+x^2-2x\cos\alpha}. \quad . \quad . \quad . \quad . \quad . \quad (5)$$

Further, when no saturation is present,

$$i_\mu=C_1\Phi. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (6)$$

The torque is proportional to Φ or i_μ, and the energy component i_a of the stator and rotor currents (i_a is shown dotted in Fig. 3). Thus, in Fig. 3, the torque

$$D=C_2i_\mu i_{st}\sin p=C_2i_\mu i_r\sin q. \quad . \quad . \quad . \quad . \quad (7)$$

This, of course, is the same for stator and rotor, but in opposite directions, since the energy components of the currents are equal and opposite.

Further, we have

$$\sin p=\frac{i_r}{i_\mu}\sin\alpha=x\frac{i_{st}}{i_\mu}\sin\alpha,$$

and the torque is then

$$D=C_2xi_{st}^2\sin\alpha$$
$$=C_2i_\mu^2\frac{x\sin\alpha}{1+x^2-2x\cos\alpha}. \quad . \quad . \quad . \quad . \quad (8)$$

Now the flux and stator pressure are always proportional,

$$P_{st}=C_3n_0\Phi, \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (9)$$

so that we get for the torque

$$D=CP_{st}^2\frac{x\sin\alpha}{1+x^2-2x\cos\alpha}, \quad . \quad . \quad . \quad . \quad (10)$$

where all the constants are combined in C.

Lastly, to replace the variable stator pressure P_{st} by the applied pressure P, we have, from Fig. 2,

$$P^2=P_{st}^2+P_r^2-2P_{st}P_r\cos\alpha$$
$$=P_{st}^2+(1+x^2s^2-2xs\cos\alpha). \quad . \quad . \quad . \quad (11)$$

Hence, for the torque, we get finally,

$$D=CP^2\frac{x\sin\alpha}{(1+x^2-2x\cos\alpha)(1+x^2s^2-2xs\cos\alpha)}. \quad . \quad (12)$$

The constant C can be replaced by the normal torque D_0 at the normal pressure P_0 at synchronism, $s=0$, with the brush angle α_0 (*e.g.*, $\alpha_0=30°$) and $x=1$, whence

$$\frac{D}{D_0}=\frac{P^2}{P_0^2}2\tan\frac{\alpha_0}{2}\frac{x\sin\alpha}{(1+x^2-2x\cos\alpha)(1+x^2s^2-2xs\cos\alpha)}. \quad (13)$$

It has already been shown that the three-phase series motor possesses a limit of stability for the speed, below which the motor cannot work, because an increase of speed corresponds to an increase of torque. In the limiting position itself the torque does not alter with the speed, whilst above it the torque decreases as the speed rises, that is, the motor is stable. To find this limiting position we must find the maximum torque with respect to the speed. This is when $1+x^2s^2-2xs\cos\alpha$ is a minimum.

By differentiating we get for the equation of stability

$$xs=\cos\alpha$$

or

$$\frac{n_s}{n_0}=1-\frac{\cos\alpha}{x}. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (14)$$

This position is entirely independent of the saturation. The position of stability can also be found from the pressure diagram, as shown previously. This happens when the stator pressure P_{st}, or the flux, is a maximum. P_{st} is then the diameter of the circle and the pressures form a right-angled triangle, whence

$$P_r=P_{st}\cos\alpha$$

from which equation (14) follows (cp. equation 3).

* Abstracted from an article in the "E.T.Z." Recently several valuable articles by the present author have appeared in the "E.T.Z." and "El. M." on the three-phase series commutator machine, and its self-exciting properties as generator. We much regret that pressure on space prevents our doing justice to these also.

† An abstract of this article recently appeared in THE ELECTRICIAN, April 7, 1911. A knowledge of this article is assumed in what follows.

Digitized by Google

It is seen that the limiting position only depends on x and a, and is independent of the pressure and torque. By making $x<1$, that is, by using fewer ampere-turns on the rotor than on the stator, we can make the stable position as low as we like. In Fig. 4 the stability curves are shown for different ratios x as function of the brush angle a. It is clear that stability at low speeds is easily attained with small brush angles but not with large.

The only way to obtain a better range of stability is to vary x and a together. For this the simplest relation is

$$x = x_0 \cos a. \quad \ldots\ldots\ldots \quad (15)$$

In Fig. 4 the stability limits are shown dotted for different values of x_0 in the short-circuit position—these are constants and entirely independent of the working of the motor. Each value of x_0 corresponds to a minimum speed attainable in working and is given by

$$\frac{n_s}{n_0} = 1 - \frac{1}{x_0}. \quad \ldots\ldots\ldots \quad (16)$$

Hence x and the ratio of the windings can be at once found for any required conditions.

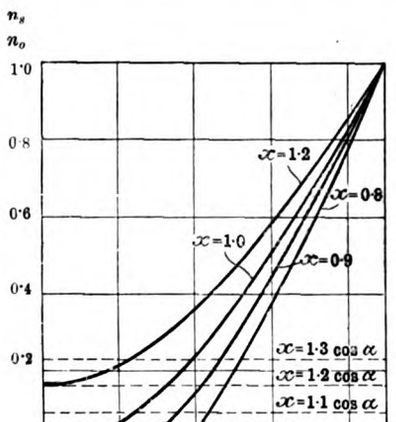

Fig. 4.—Limit of Stability.

If the motor, therefore, has to work at very low speeds, then $x_0>1$. With $x_0=1$ and, therefore, $x=\cos a$, the motor is perfectly stable and the formula for the torque becomes (from equation 13)

$$\frac{D}{D_0} = \frac{P^2}{P_0^2} \frac{2\tan\frac{a_0}{2}}{\tan a(1-s(2-s)\cos^2 a)}. \quad \ldots\ldots \quad (17)$$

The starting torque ($s=1$) with normal pressure is

$$\frac{D_a}{D_0} = 2\tan\frac{a_0}{2}\frac{\cos a}{\sin^3 a}, \quad \ldots\ldots \quad (18)$$

whilst for the normal unstable motor with $x=1$ and $s=1$, the starting torque is

$$\frac{D_a}{D_0} = \tfrac{1}{4}\tan\frac{a_0}{2}\frac{\cos\frac{a}{2}}{\sin^3\frac{a}{2}}. \quad \ldots\ldots\ldots \quad (19)$$

With the normal brush angle $a_0=30°$, the curves representing equations (18) and (19) practically coincide for all values of $a<60°$.

The variation of the ratio x can be made directly by altering the number of effective turns in the stator or the auxiliary transformer. The simplest way, however, is to provide two brushes for each phase—these brushes being movable relative to one another,

II.—Compensation.

We shall now investigate the effect of the ratio of transformation x on the power factor of the three-phase series motor. In Fig. 5 the current diagram of the effective ampere-turns is given, and in Fig. 6 the pressure diagram of the stator and rotor windings. Splitting up the stator current, i_{st}, into its watt component i_a and its wattless (magnetising) component i_μ, we get the angle ϕ_0 between i_a and i_{st}. The same angle occurs in the pressure triangle between the watt component P'_{st} and the total stator pressure P_{st}. The latter pressure, P_{st}, is displaced from the applied pressure P by the angle a, whilst the current I is in phase with the watt component P'_{st}, hence the power factor of the motor is

$$\cos\phi = \cos(\gamma+\phi_0) = \cos\gamma\cos\phi_0 - \sin\gamma\sin\phi_0.$$

Further from the current diagram and equations (4) and (5), we have

$$\left.\begin{aligned}\cos\phi_0 = \sin p &= \frac{x\sin a}{\sqrt{1+x^2-2x\cos a}}\\ \sin\phi_0 = \cos p &= \frac{1-x\cos a}{\sqrt{1+x^2-2x\cos a}}\end{aligned}\right\} \quad \ldots \quad (20)$$

$\cos\phi_0$ is the power factor of the stator or the power factor at synchronism, for at this point $\gamma=0$.

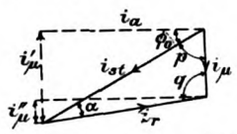

Fig. 5.—Space Diagram of Currents.

From the pressure diagram and equations (2) and (11) we get similarly

$$\left.\begin{aligned}\sin\gamma &= \frac{xs\sin a}{\sqrt{1+x^2s^2-2xs\cos a}}\\ \cos\gamma &= \frac{1-xs\cos a}{\sqrt{1+x^2s^2-2xs\cos a}}\end{aligned}\right\} \quad \ldots \quad (21)$$

whence we get for the power factor, finally

$$\cos\phi = \frac{1}{\sqrt{1+\left(\frac{1+x^2s-x(1+s)\cos a}{x(1-s)\sin a}\right)^2}} \quad \ldots \quad (22)$$

Thus the power factor depends on the speed, the brush angle and the ratio x, and is unaffected by the saturation.

For $x=1$, the power factor is

$$\cos\phi = \frac{(1-s)\cos\frac{a}{2}}{\sqrt{1+s^2-2s\cos a}}, \quad \ldots\ldots \quad (23)$$

as also shown in the previous Paper.

For complete stability, *i.e.*, $x=\cos a$, we get

$$\cos\phi = \frac{1}{\sqrt{1+\left(\frac{\tan a}{1-s}\right)^2}}. \quad \ldots\ldots \quad (24)$$

This latter value is always considerably smaller than that for unstable motor. This is best seen for synchronism where we h

$$\text{for} \quad x=1, \qquad \cos\phi_0 = \cos\frac{a}{2},$$
$$\text{for} \quad x=\cos a, \quad \cos\phi_0 = \cos a.$$

The meaning of this is that in the latter case the current tria in Fig. 5 is right-angled, and the whole magnetising current is plied by the stator, whilst with $x=1$ and an isosceles current

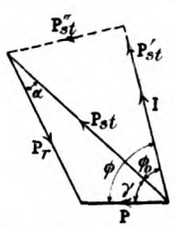

Fig. 6.—Time Diagram of Pressures.

angle, half is given by the stator and half by the rotor. Thus complete stability ($x=\cos a$), complete compensation ($\cos\phi=$ not possible.

For unity power factor, the term in the brackets in equatio must vanish. Since the denominator cannot become infinite, the condition for $\cos\phi=1$

$$1+x^2s = x(1+s)\cos a, \quad \ldots$$

whence

$$s = 1-\frac{n_k}{n_0} = \frac{\cos a - \frac{1}{x}}{x-\cos a} \quad \ldots\ldots$$

is the slip or speed n_k for which $\phi=0$. At lower speeds ϕ l higher speeds it leads. From the curves drawn to represe relation, it is at once clear that at low speeds and large bru placements x becomes very large and over a certain range co compensation becomes impossible. The working range of the therefore, is usually chosen with small brush angles.

A NEW METHOD OF DETERMINING THE EFFICIENCY OF SLIP-RING INDUCTION MOTORS.

BY H. J. S. HEATHER.

The machine usually called the induction motor may be looked upon as the most general form of the transformer. It has the power of transforming both frequency and voltage in any desired (though not independent) ratio ; it is also able to change electrical into mechanical energy and *vice versa*. If the primary (or stator) of such a motor is connected to a source of alternating current supply, and the rotor clamped so that it cannot turn, the secondary (or rotor) may be made to give out, from its slip rings, currents of the same periodicity as the supply. The mechanical control of its movement results in its acting wholly as a transformer, and its mechanical output is zero. If, on the other hand, its electrical output is reduced to zero by short-circuiting the slip-rings, its whole output takes the mechanical form and the rotor rotates at a speed depending only on the torque opposing its motion. Between these two extremes any number of intermediate conditions may obtain in which the output is partly electrical and partly mechanical, the proportion between the two parts being dependent upon the torque the machine is compelled to give out mechanically and the resistance between the slip-rings from which the electrical output is derived. If there were no losses in the machine, the total output at a fixed current input would be absolutely constant, whether this output was wholly electrical, wholly mechanical, or partly electrical and partly mechanical.

There must, however, be losses, and these losses come under the following headings :—

Primary iron loss.
Primary copper loss.
Secondary iron loss.
Secondary copper loss.
Friction loss.

The secondary output, plus the above losses must be equal to the primary input.

Now, suppose that the primary is taking in a certain fixed current from a constant-potential supply. Then, of the above losses, the primary iron loss, primary copper loss, and secondary copper loss, remain unaltered whether the machine operates wholly as transformer, wholly as motor, or partly as one and partly as the other. The only losses that change, therefore, through altering the function of the machine from transformer to motor are the secondary iron loss and the friction loss.

If, therefore, we can ascertain what changes these two losses undergo in changing the machine from a transformer to a motor, the machine's mechanical output as a motor can be determined by measuring its electrical output as a transformer and applying the correction demanded by the changes in the above-mentioned losses, viz., those in friction and in the secondary iron. The fact of the existence of slip will be taken into account by this procedure, as the slip corresponds to the current used and the rotor copper losses will not be included in the electrical measurement of the output.

This correction can be found quite simply. The machine can be run as a motor without load and with its rings short-circuited, and the watts and current input can be measured. The secondary current will be small enough to be negligible (though it can be measured if it is thought necessary), and so will the secondary iron loss for the secondary periodicity is practically zero. The watts input *minus* the primary copper loss are consequently equal to the primary iron loss *plus* the friction loss.

Next, the rotor can be clamped with its rings open-circuited and the primary switched on to the mains. The clamping is necessary because eddy currents in the iron may be sufficiently large to start the machine as a motor. The watts and current input are then measured as before. The watts input *minus* the primary copper loss are now equal to the primary iron loss *plus* the secondary iron loss at standstill.

The two tests above described are carried out under the same conditions of applied voltage, periodicity and magnetic circuit, and the two currents are almost identical, so the induced as well as the applied voltages are practically the same. Consequently the fluxes and the primary iron losses must be the same. The difference, therefore, between the watts input *minus* the primary copper loss in the first test and the watts input *minus* the primary copper loss in the second test will give us the difference between the friction loss at full speed and the secondary iron loss at standstill.

Now, whenever the machine is acting purely as a motor, its slip will be so small that we can regard the friction loss as constant and the secondary iron loss as negligible at all loads. The error introduced by each of these inaccuracies is, of course, only a very small percentage of the total losses, and, moreover, the errors are not cumulative but in opposite directions. The difference found above between the friction loss at full speed and the secondary iron loss at standstill can, therefore, be applied at all loads as a correction to the value of the electrical output as a transformer in order to arrive at the mechanical output as a motor.

In order to get at the electrical output as transformer, it is only necessary to clamp the rotor, insert a high resistance between the slip-rings, and after switching on the stator, to reduce this resistance until the current going into the stator is that at which the efficiency is required to be determined. Wattmeter readings of the primary input and the secondary output are then taken. The output is then corrected as indicated above to determine the mechanical output as motor, and the ratio between this and the input is the efficiency.

The method above suggested has the advantages of requiring electrical measurements only, and the use of only one motor and no belts. Both in simplicity and accuracy it appears to compare favourably with any previously described process.

THE DE LAVAL STEAM TURBINE FOR DRIVING LOW OR MODERATE SPEED MACHINERY.

SOME STEAM TURBINE PROBLEMS.

[COMMUNICATED.]

Summary.—After referring to the problems involved in the design of steam turbines—namely, the efficient utilisation of the energy in the steam and yet a comparatively low speed of rotation—a description is given of the latest type of De Laval turbine and reducing gear.

THE PROBLEMS INVOLVED.

On the whole, the large size steam turbine has so far found application only for the driving of alternators and the propulsion of ships. Little progress, comparatively, has been made in its adaptation for driving direct-current generators, and for direct connection to other machinery of moderate speed, such as centrifugal pumps and blowers, or for the driving of machinery by means of ropes or belts. While the suitability of the turbine for these purposes, because of its simplicity, small weight and space requirements, good steam economy and in recent years lower price, is apparent, the engineering world has, nevertheless, awaited until now the practical solution of the problem of driving such machines by steam turbines.

The nature of the difficulty is at once apparent from a simple statement of the velocities, &c., involved. The expansion of 1 lb. of steam from 150 lb. pressure (164·7 absolute) to a 28 in. vacuum renders available for conversion into work 325 B.Th.U., equal to 252,850 ft.-lb. of energy. If the expansion be accomplished in one nozzle having unit efficiency, the resulting velocity of the steam will be 4,040 ft. per second.

If the jet of steam impinges upon a bucket standing still, it will exert a force upon the bucket equal to the flow expressed in mass units per second multiplied by the velocity with which the steam strikes the bucket, while the jet leaving the bucket will also be the cause of a reaction equal to the mass per second multiplied by the velocity with which the steam leaves the bucket. Although a pressure is exerted no work will be done upon the bucket so long as the bucket stands still. If the bucket moves, however, the forces exerted upon the bucket will, as before, be equal to the mass per

Digitized by Google

second multiplied by the relative velocity with which the steam strikes the bucket and the mass per second multiplied by the relative velocity with which the steam leaves the bucket and the work done per second will be equal to the components of the forces in the direction of motion times the distance travelled per second, that is, times the velocity of the bucket.

If the bucket velocity increases until it be equal to the velocity of the steam in the direction of motion of the bucket, it will be apparent that no force can be exerted upon the bucket, since the relative velocity of the steam striking the bucket will be zero. Between this extreme and the condition when the bucket is standing still, there is a velocity of bucket that will utilise the greatest amount of energy per pound of steam.

If there be no change in the relative velocity of the steam while traversing the bucket, this velocity of the bucket is one-half the velocity of the steam in the direction of motion of the bucket, a fact with which engineers are familiar in connection with impulse water wheels and the like. Assuming that the steam strikes the bucket in a direction tangential to the line of motion, this calls for a bucket travelling at a speed of 2,020 ft. per second, and, if the bucket be mounted upon a wheel 3 ft. in diameter, for a speed of 12,850 revs. per min.

As a matter of fact, the direction of the steam jet cannot be tangential to the line of motion of the bucket, since that would imply zero area of nozzle, and, as a practical matter, 20 deg. is found to be the least angle that is suitable. Again, the velocity of the steam leaving the nozzle is only about 97 per cent. of the velocity indicated by the thermodynamic theory, and the relative velocity of the steam leaving the bucket is, due to frictional and other losses while traversing the bucket, only about 80 per cent. of the relative velocity of the steam striking the bucket. Making allowances for the necessary entrance and leaving angles and for the losses due to friction, we find that the most efficient speed for the assumed case would be about 1,960 ft. per second.

As this, however, would still be somewhat greater than the safe limit imposed by the strength of the material of the wheel, the velocity actually used in wheels, properly designed for high speeds, is about 1,400 ft. per second, under which conditions about 73 per cent. of the energy of the expanded steam will be transferred to the wheel. This wheel velocity, however, still corresponds to a speed of 9,520 revs. per min. for our assumed 3-ft. wheel, which would be usable for very few purposes.

All the different types of steam turbines now on the market arise from the attempt to solve the problem involved in reducing this speed to speeds of practical use. A simple means of reducing the speed would be to increase the size of the wheel. This suggestion has been made repeatedly. Actually, however, the wheel required is of prohibitive size from the standpoints of space occupied, strength of materials and efficiency, since the large wheel would consume a considerable amount of power on account of skin friction and windage of buckets.

The next solution in the order of simplicity is to use gears to reduce the speed of the turbine wheel to the speed of the driven machine as was done by De Laval over 30 years ago. This has proved eminently satisfactory in sizes up to about 750 H.P., and has resulted in the production of the most efficient type of turbine within this range of size, giving, furthermore, low speeds that are practically unattainable by other means, and enabling the turbine to be directly connected to machinery of all kinds and to be used for belt and rope-driving.

The third method of speed reduction is by "multi-staging," which has been carried out in three ways. The most simple is the use of so-called "velocity stages"—that is, the wheel, instead of travelling approximately half as fast as the steam, travels, let us say, at one-eighth of the velocity of the steam, so that the rebounding steam will possess three-quarters of its original velocity upon leaving the first row of buckets. A stationary row of buckets then redirects the steam upon buckets carried by the next wheel, which abstracts another quarter of the velocity, and so on through four rows of moving buckets, which would, theoretically, abstract all the velocity. However, as pointed out above, there is a loss of velocity in traversing buckets, whether stationary or moving. If the velocity coefficient of the buckets is 80 per cent., the velocity would be so far expended at the end of the second row of stationary buckets that it would not exercise any propulsive effect upon the third row of moving buckets. In other words, the velocity of the steam soon runs down, and the efficiency of a wheel carrying so many rows of moving buckets would be very low. Steam turbines of this type are improved in efficiency by a partial adoption of the pressure stage method of compounding.

This consists in the use of pressure stages instead of velocity stages. That is, the total pressure range, or rather energy, is divided up into parts, which are utilised in what are really independent turbines. The steam first experiences a partial pressure drop through a nozzle and then impinges upon a row of moving buckets, after which it passes through a second nozzle and impinges upon a second row of buckets, and so on. Inasmuch as the velocity of the moving steam varies as the square root of the energy converted into motion, dividing the energy drop into four parts, would reduce the velocity only to one-half, and to reduce the speed of the wheel to one-quarter, as in the preceding example, will require 16 stages, in stead of four. This method of speed reduction is also subject to losses of energy, for one thing by the skin friction of the greater number of discs rotating in steam, some of which is at comparatively high pressure, and for another, the shaft carrying the wheels must pass from one chamber to another and leakage will take place along the shaft where it passes through the diaphragms.

The remaining method of speed reduction is one of the oldest, having been developed almost contemporaneously with the De Laval gear. It differs from the multicellular type just discussed, in that the drop in pressure is not confined to the stationary nozzle, but there is a drop in the pressure of the steam while passing through between the moving buckets. In fact, as far as the relative action is concerned, it would be immaterial whether the casing stood still and the shaft rotated, or the shaft stood still and the casing rotated. This is the reaction turbine, so called because the steam enters the buckets with nearly zero relative velocity in the direction of motion of the bucket, and the entire propulsive force is obtained from the reaction of the jets of steam escaping from the buckets on the low-pressure side. The buckets should move with the velocity of the spouting steam, but as each pair of stationary and moving buckets gives in reality two pressures stages, the total energy drop is divided into twice as many parts as there are moving rows of buckets. Since the buckets move as fast as the spouting steam, and since the buckets in the single impulse wheel with which we started moved half as fast as the steam, if we are to get a speed reduction of 4 to 1 as in the other cases discussed, it will be necessary that the spouting velocity of the steam be one-eighth of the spouting velocity obtained where all the energy is converted in one pressure stage and, since the spouting velocity varies as the square root of the energy drop, the energy drop

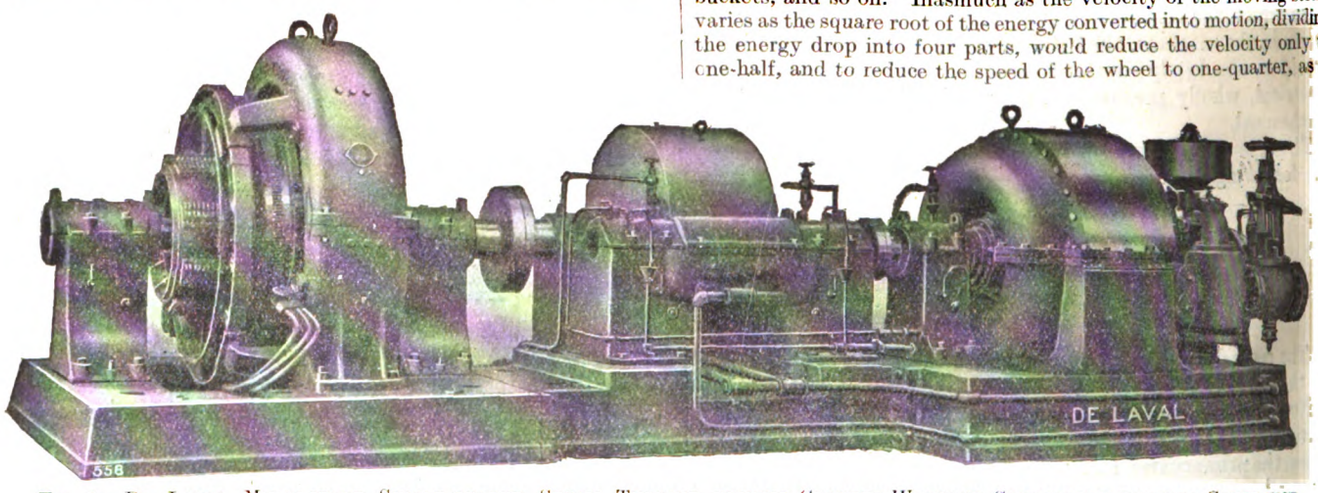

FIG. 1.—DE LAVAL MULTI-STAGE SINGLE-GEARED STEAM TURBINE, DRIVING CROCKER-WHEELER CONTINUOUS-CURRENT GENERATOR. Capacity 500 kw., Speed 500 revs. per min., High-pressure Type.

Digitized by Google

per stage should be only $\frac{1}{64}$ of the whole. However, since there are two pressure drops for each row of moving blades in this type of turbine, the number of rows of moving blades required will be 32.

Besides the great number of rows of buckets the reaction type of turbine suffers from other disadvantages which are much more serious, especially with high-pressure steam. The principal of these is that, since there is a difference of pressure on the two sides of every row of blades, whether stationary or moving, there is necessarily a leakage through the clearance over the ends of the blades, and further, since the large number of rows of blades calls for a long shaft, the clearance must be considerable in order to take care of possible vibration, distortion due to unequal expansion by heat, &c. Again, if the same angles are preserved throughout, the length of the blades increases directly as the volume of the steam, and since steam in expanding adiabatically from 150 lb. gauge to 28 in. vacuum, increases in volume in the ratio of 1 to 93, it will be seen that the low-pressure blades will either be extremely long or the high-pressure blades extremely short. This difficulty has been met to a certain extent by mounting the first rows of blades on a drum of smaller diameter, which, however, by reducing their velocity increases the number of rows required.

The difficulty of providing for the increasing volume of steam is easily overcome in the case of multicellular turbine, where there is no objection to using partial admission in the high-pressure stages, while with the reaction turbine, such partial admission would result in subjecting the wheel to alternations of pressure during a revolution which might set up serious vibration, and which would, in any case, be accompanied by leakage of steam tangentially along the wheel from points of admission to points of no admission and by consequent steam shock and loss of energy.

We have then the following figures to secure a speed reduction of 4 to 1:—

For the pure velocity stage turbine, four rows of moving buckets will be required. For the multicellular type of turbine, 16 rows of *moving buckets* will be required; while for the reaction type of *turbine*, 32 rows of moving buckets will be required.

To illustrate the foregoing, suppose the problem is to obtain a driving speed of 600 revs. per min. from steam at 150 lb. gauge exhausting to a 28 in. vacuum, that the admission angles are 20 deg. throughout and that the blade coefficient is 100 per cent. The single-wheel turbine will be 62 ft. in diameter. If a 3 ft. wheel is used with gear reduction, a gear ratio of 21 to 1 will be required. If velocity stages are used on a 3 ft. wheel there must be 21 of them. If they are divided into two groups with pressure drop between, each will need to contain 14 velocity stages. If they are divided into three groups of pressure stages, each will need to contain 12 velocity stages. The multicellular turbine with pressure stages throughout will, neglecting the fact that the friction loss in one stage is available as heat for the next stage, contain 440 stages. The reaction turbine will contain 1,760 stages—that is, 880 rows of moving buckets.

The single-stage wheel, without gears, may be left out of the discussion because of its size and the difficulty of construction. The single-stage geared wheel is entirely suitable in sizes up to about 750 H.P. as stated, but in sizes above that it will be found that, unless the blades are made quite long or unless the angle of entrance is increased, the power of the wheel is strictly limited by the available area for the nozzle outlets and it must be remembered that at the outlets these nozzles must have an area corresponding to the final volume of the steam expanded down to 28 in. vacuum. Further, if the nozzle area is increased by increasing the length of the blades, the latter soon reach their limit of strength at the root for the speed employed, and, as a third limitation at high powers, the speed of the shaft in its bearings would be excessive, considering the thrust which they would be called upon to withstand in transmitting the power to the gear, although this one objection may be obviated by the use of double gears, wherein the downward thrust of one upon the pinion is balanced by the upward thrust of the other, so that little, if any, pinion thrust is transmitted to the bearings.

When we come to consider the multi-stage turbines, it is at once seen that they are out of the question for any such speed as that named—that is, the number of stages is so great that the shafts would be very long and subject to vibration, and difficulties in regard to clearance, both from springing of the shaft and from unequal contraction and expansion of shaft and casing, not to mention the great cost, low efficiency, would arise. For this reason it has been the common practice to give over the attempt to force down the speed of the turbine after a certain point and instead to endeavour to bring up the speed of the driven machine.

In the case of alternators this has been fairly successful, even though the speeds ordinarily adopted—viz., from 1,500 to 3,000 revs. per min—for sizes below 5,000 kw. require long rotor drums, introducing difficulties of mass balancing, vibration of the shaft through unsymmetrical distribution of the magnetic field, high velocity in the bearings, insufficient space for coil windings, insulation and ventilating ducts, special difficulties in insulation peculiar to high speed and resulting from compression of dust by centrifugal force, drying out of insulation, permitting the conductors to move in a radial direction, difficulties in making allowance for expansion and contraction of copper, difficulties in regulation due to too high saturation of the field magnets, &c.

It is with the direct-current generator, however, that the case becomes most serious. Among the many disadvantages of high-speed direct-current machines may be mentioned the following:—

Proper commutation involves carefully designed construction, as the diameter of the commutator is limited by the allowable peripheral speed; it is usually necessary to use a double length commutator in order to obtain the requisite area and keep down the current density within satisfactory limits; the number of commutator bars and the distance required between brushes limit the number of poles which may be used; with very long commutators or with two commutators in tandem, there is difficulty in securing uniform distribution of current between the different brushes of each brush arm; very careful shop work is required; the increased length of shaft necessary to accommodate the commutator increases trouble from vibration, which, in turn, interferes seriously with the commutation, especially if carbon brushes are used; while it is difficult to compute the critical speed of a direct-current armature, it is very important that that speed be not approached, also that the commutator and armature be in perfect balance; due to drying out or other change in the insulation after the commutator and windings have been assembled, there is generally a displacement of the centre of gravity which will give rise to vibration; the necessity of limiting the

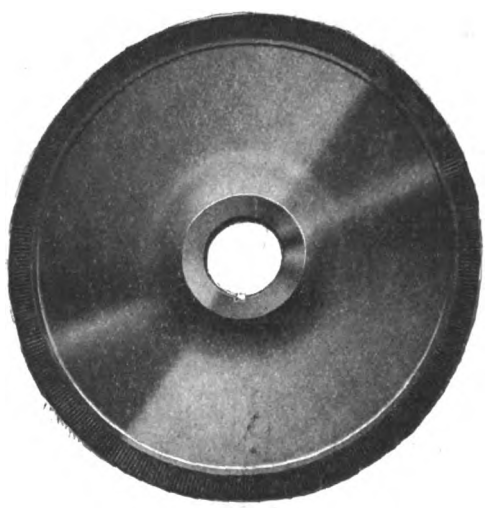

Fig. 2.—Single Wheel with Buckets.

diameter of the armature restricts the space available for insulation and for armature winding, so that it will be doubtful if the increased windage, iron losses and friction will be neutralised by a decrease in the purely electrical losses, which might be expected from the more compact construction and greater activity of the armature conductors; due to the very high speed at which the armature must run and the necessity of passing a large amount of air through in order to keep it cool, there is a great tendency for the collection of dust, including carbon dust from the brushes, and it is found that under high-speed conditions this dust assumes a very compact form, which frequently results in short-circuits or earths; finally, while the standard speed electrical generator is entirely familiar to the ordinary operating man, who can make such small repairs as may be required, the repair of the high-speed generator is entirely beyond both his knowledge and his facilities. In fact, the majority of dynamo designers appear to be of the opinion that direct-current units of 1,000 kw. should not exceed a speed limit of 600 revs. per min., and this speed has, in fact, been found most suitable also for smaller machines, even down to 500 kw. These speeds, however, are altogether too low for the ordinary turbine, for, as pointed out, they involve an excessively long turbine, or otherwise the efficiency must be greatly sacrificed, and, moreover, a turbine of four to six times this speed would, on account of its shorter shaft and other factors, be easier, as well as cheaper, to build with a given factor of safety.

The De Laval Multi-stage Geared Turbine.

In view of the pressing nature of the speed-reduction problem, the turbo-generator which we are about to describe possesses considerable theoretical and great practical interest.

Digitized by Google

Helical reduction gears were adopted by De Laval almost at the inception of his work on the steam turbine, and have proved entirely satisfactory under service conditions, while having many exclusive advantages over the other methods of speed reduction. While there is a general and natural objection to the introduction of gears where their use can be avoided, still if by special design and methods of construction gears can be made at a reasonable expense that will be reliable, efficient and long-lived, while eliminating the several undesirable features inseparable from a great number of stages, their use becomes the logical engineering procedure. The efficiency of the double helical gear as made by the De Laval companies has been found to lie between 98·5 and 99 per cent., while the life of the gears is equal or superior to the wearing parts of reciprocating engines, as shown by the fact that all the gear cutters fitted for producing De Laval gears could not replace the gears now in use once in five years if operated day and night continuously.

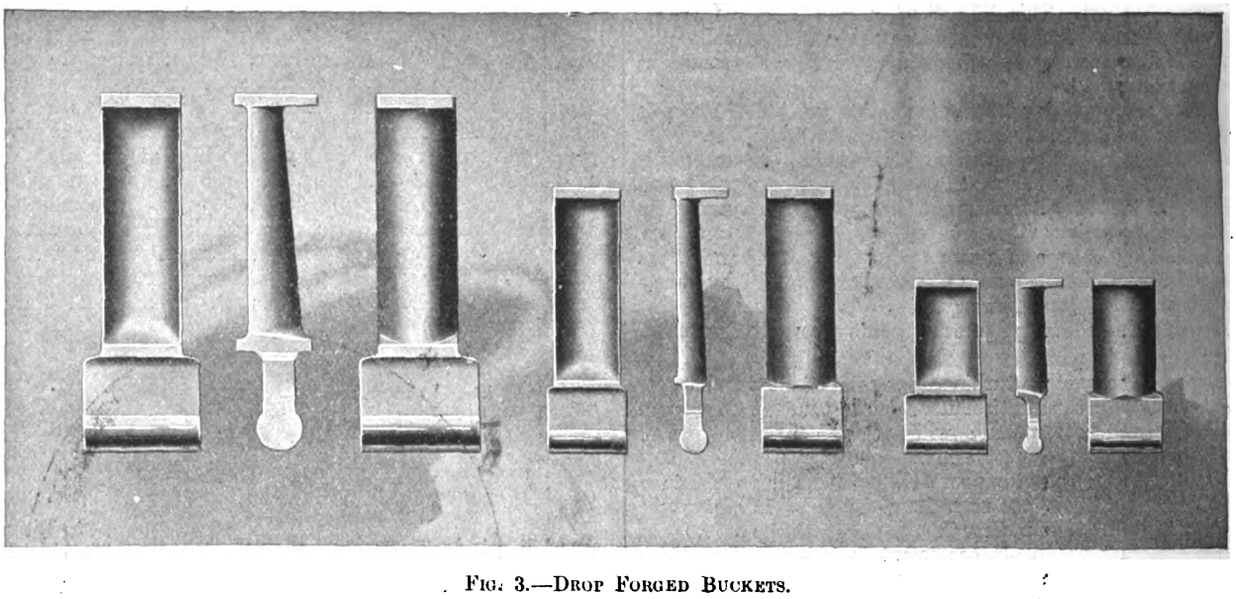

Fig. 3.—Drop Forged Buckets.

The fact, however, that the capacity of the De Laval single-stage turbine is limited, as pointed out in a preceding paragraph, has led to the assumption on the part of many that the limitation lies in the gear. This is not the case, and over five years ago the De Laval Company, of Sweden, instituted experiments with a view to the development of a high-power single-gear reduction and about the same time offered to instal a 550 H.P. gear for driving the steamer "Atland" by steam turbines.

Experimental work was nevertheless continued on large gears for stationary turbines, including not only the gear itself, but also suitable machinery for the accurate production of the gears. The need of special effort in this direction is exemplified by the fact that several months of continuous work by a skilled machinist were required for the correction of a lead screw purchased from one of the best shops in this country, before it was considered sufficiently accurate to be used in the gear-cutting machine on which were produced the gears of the machine that we are about to describe.

This unit, shown in Fig. 1, consists of a multi-stage turbine driving a standard-speed, direct-current Crocker-Wheeler generator through a pinion and single gear, the speed of the turbine shaft being 3,600 revs. per min., and the speed of the generator shaft 500 revs. per min. The illustration gives a good idea of the compact nature of the construction of a turbine, the maximum capacity of which is 1,200 H.P.

The main casing consists of cast-iron and is approximately cylindrical in shape, being split horizontally so that the top half may be lifted off to give access to the revolving and stationary members of the turbine. The casing is supported on a level with the centre of the shaft by two pedestals rising from the bedplate, one on each side, and is bolted down only at one end, being free to expand and contract in an axial direction between steel guides. As the endwise position of the shaft is also determined by a thrust bearing at the same end, the results of axial expansion are largely compensated for.

Steam is admitted to the turbine first through a strainer case and then through a combined trip and throttle valve, to be seen at the extreme right; next through the adjacent governor valve and then, after passing through steam nozzles of the standard De Laval type, impinges upon the blades of the first-stage wheel. Partial admission is used in the first stage, but full admission in later stages. The wheels, as will be seen from Fig. 2, are of the standard De Laval type, made of such section as to give great strength throughout; this type of wheel is exceedingly strong and is capable of withstanding high speed, as exemplified in the De Laval single-stage turbine. In order that no danger may be anticipated from the wheel if it should break, it is completely surrounded by steel armour, as will presently be explained.

The buckets are set in the rim by a peculiar form of dovetail, as illustrated in Fig. 3. The buckets are drop forged from solid bars of non-corrodible metal and are allowed to retain the original smooth, glossy finish imparted by the drop-forging process. Such buckets, it is found, wear much more satisfactorily than machined buckets, since they present a smoother surface initially, and if they receive only dry steam their life is almost unlimited. The use of a special metal also avoids the rusting which has been the cause of serious annoyance with steel buckets and even with mild nickel steel buckets, whereas high nickel steel buckets have shown a tendency to become brittle and to break unexpectedly.

The wheels are mounted upon the shaft by split taper sleeves drawn tightly into place by internal nuts in the wheels, and after the wheels are assembled, a lock nut on the shaft serves further to secure them, while rotation of the wheels about the shaft is prevented by a key. The greater blade length required by the increased volume of the steam as it proceeds towards the exhaust is secured both by reducing somewhat the diameters of the wheels and by increasing slightly the bore of the casting.

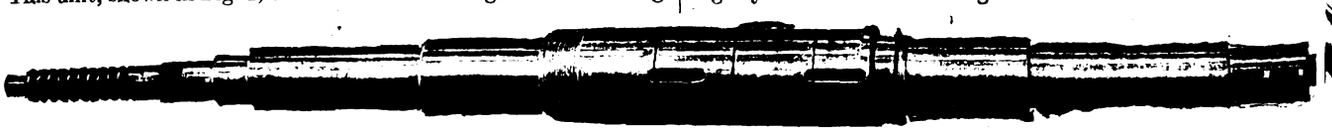

Fig. 4.—Turbine Shaft.

The entire shaft is seen in Fig. 4, where the positions of parts so far described may be plainly discerned. To the right and the left of the portion on which the wheels are mounted may be seen a smooth space where the shaft passes through the packings at the high-pressure and low-pressure ends of the turbine respectively, while the smooth spaces of smaller diameter beyond these are the parts of the shaft running in the bearings. The reduced section at the right having two small key-ways for Woodruff keys receives one-half of the flexible coupling, by which the high-speed shaft is connected to the pinion or to other driven machinery. The short length of shaft having a place for one Woodruff key at the left end is for the reception of the worm driving the worm wheel on the vertical governo

Digitized by Google

shaft, while the ringed portion at the extreme left is the marine thrust bearing which determines the endwise position of the shaft.

Upon rebounding from the moving blades the steam again expands by passing between the guide vanes placed all round the periphery of the diaphragm between the first stage and the second stage. These blades are made of "extruded" metal and are fitted on to the cast-iron diaphragm. The diaphragm itself (Fig. 5) is slightly dished in order to increase its strength to withstand pressure, and to complete it a solid steel band is shrunk over the tips of the guide blades. The steel band is slightly wider than the blades and diaphragm, and as

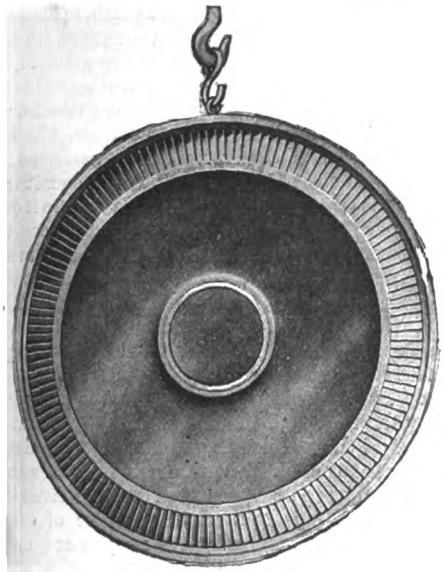

Fig. 5.—Diaphragm and Guide Vanes.

adjacent bands touch each other, a complete steel casing is formed which would effectually prevent the possible penetration of parts in case of rupture of the wheels. The centre of the diaphragm is perforated for the passage of the shaft and leakage of steam is prevented by a labyrinth packing.

The packings surrounding the shaft at the high-pressure and low-pressure ends are more elaborate. The high-pressure packing, which is called upon to withstand a pressure of about 25 lb. per square inch, consists of a long labyrinth, followed by four carbon packing rings. Any steam leaking by the labyrinth packing is piped to one of the intermediate stages of the turbine and utilised, while any steam leaking by the first carbon ring is taken to the exhaust outlet. The packing at the exhaust end of the turbine consists of three carbon rings,

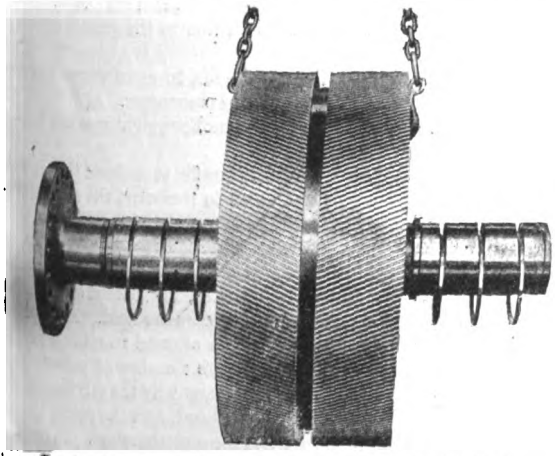

Fig. 6.—Reduction Gear of Single-geared Turbine.

steam at reduced pressure being led in between the first and second ring from the outside, which is also done at the high-pressure end. This ensures that any leakage into the exhaust when vacuum is carried, will be of steam, not of air.

The bearings of the turbine proper are of the split Babbit lined type and are supplied with oil through sight-feed oilers from the pump above mentioned.

The pinion and gear, perhaps the most important and interesting part of the construction, are shown in Figs. 6 and 7. As will be noticed, the gear is of the double helical or herring-bone type, differing from the standard gears supplied with De Laval turbines only in size and the fact that but a single gear is used for the largest capacities. The pinion is cut from a solid bar of steel and is carried in plain Babbited bearings supported in a rigid cast-iron frame, which also supports the gear bearings. The pinion bearings are lubricated by sight-feed oilers from the pump system before referred to, the excess oil overflowing to the wells of the gear bearings, which are ring oiled. The gear consists of a solid cast-iron centre upon which are shrunk two steel rings. The hub is mounted on a stiff shaft, which carries at one end a half of the flexible coupling for connection to the driven machine. The gear, complete with shaft, bearings and coupling may be also seen in Fig. 6.

The lubrication of the gear and pinion teeth is accomplished by jets of oil directed at the line of contact on the entering side. This

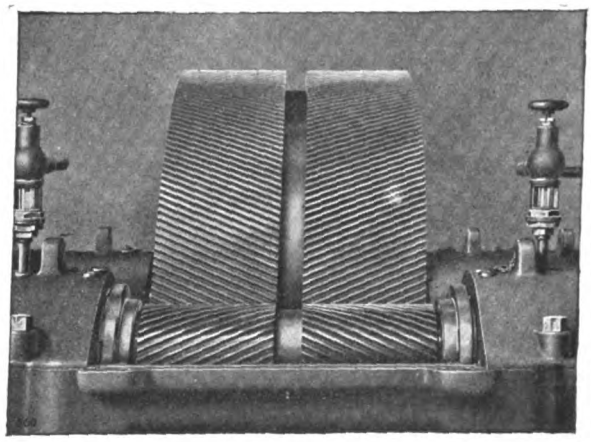

Fig. 7.—Gear Wheel and Pinion.

oil after use is passed through an oil strainer located in the base of the turbine, then through a cooling and settling chamber and then to the oil well, from which it is again pumped through the circuit.

The governing mechanism, Fig. 8, is in duplicate, that is, there is a speed regulating governor and a speed limiting or emergency governor. The former is mounted at the top of a vertical shaft driven by a worm gear from the turbine shaft. It is of an extra heavy, substantial type and controls, through a system of two bell-crank levers and a connecting rod, the movement of a vertical double-seated poppet valve similar to that used on standard De Laval turbines, as shown in Fig. 9. In order to prevent damage to the valve by overtravel of the governor, a spring is inserted in the connecting rod, as

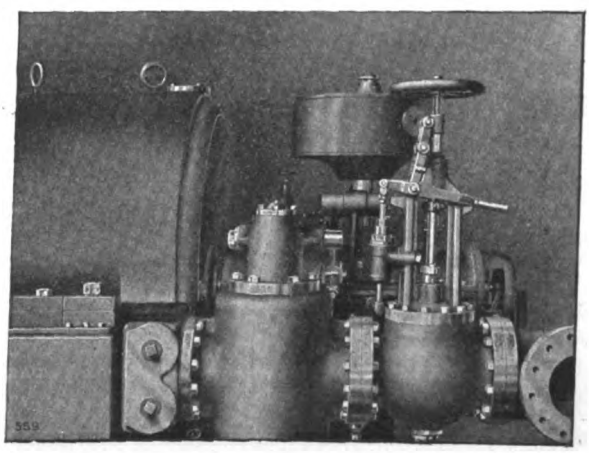

Fig. 8.—Governor Mechanism.

seen in Fig. 8. The same worm which meshes with the worm wheel on the governor shaft, meshes with another worm wheel driving the tachometer, which is supplied as a permanent and regular part of the equipment. The lower end of the governor shaft is connected to an oil pump, supplying the bearings of the machine and the pinion and gear.

The emergency governor is located in the end of the turbine shaft itself and is ordinarily not in contact with the trip. Upon touching the latter steam pressure is at once released from underneath a piston, by means of which a toggle gear is released, allowing the combined

Digitized by Google

trip and throttle valve to close under the pressure of the steam in the supply pipe. This trip may also be sprung by hand, if desired, while the valve spindle is also furnished with a hand wheel and is threaded, so that it may be used as a throttle valve independently of the trip.

The generator is of the standard engine type adapted for the speed of 500 revs. per min., which is the same as could be used for a belted machine of this capacity. The field consists of eight main poles and eight auxiliary or commutating poles, the commutating poles being connected in series with the armature circuit.

The operation of the turbo-generator above described is remarkably free from vibration and noise, and as it stands in the test room, supported upon small screw jacks without other steadying means, it is impossible to tell from a few yards away whether or not the turbine is running without noting the moving parts. There is no vibration and no noise that may be overheard at a short distance. The quiet running is attributed to several causes, chief among which is a specially designed gear-cutting machine and the adequate method of lubrication employed.

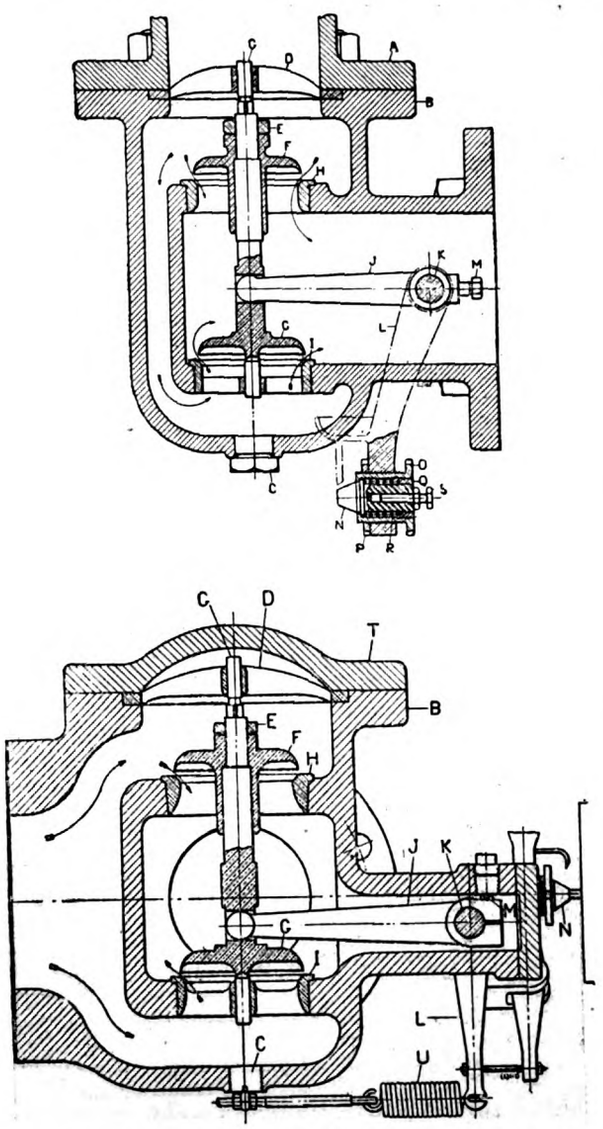

FIG. 9.—CROSS SECTION OF GOVERNOR VALVE SHOWING REMOVABLE DISCS AND SEATS.

It might be mentioned in passing that the determination of the efficiency of such gears within reasonable limits of accuracy is a comparatively simple matter and does not require the use of cumbersome and expensive hydraulic brakes or similar mechanisms. Since all energy lost in friction in the gear must be converted into heat, the measurement of the heat emanating from the gear case will give an accurate measure of the loss of energy in the gears. Such measurement of the heat is not difficult. The radiation from the casing can be determined accurately for any given temperature by observing either the rate of cooling under fixed conditions or by keeping the casing warm by means of hot water or steam. The amount of heat removed from the gears by the lubricating oil is even more easily determined by measuring the inlet and outlet temperatures and the weight of oil used per minute or per hour.

A FEW REASONS WHY ELECTRIC TRACTION IN ENGLAND REMAINS STATIONARY.*

BY GERALD H. J. HOOGHWINKEL.

Summary.—The author discusses the reasons why tramway enterprise does not pay in this country as it does on the Continent. He suggests that if small tramway undertakings are to pay, many alterations must be made, including the adoption of the bow collector, light single-deck cars, and a more elastic form of track construction.

The author brings forward some points which, in his opinion, must be radically altered if private capital and enterprise are to look again at the exploitation of electric tramways favourably. There is no reason why such enterprises should not pay here as well as in Germany and France. There are, of course, many other reasons, such as bad roads and streets and large factory populations, which, as against purely agricultural districts, &c., have a preponderant influence on the results; but seeing that these conditions are equal in many towns and districts of the countries mentioned above, there is only one conclusion to be drawn, and that is that our tramways cost too much to construct and to run. The question of our low fares and unremunerative special class services has already been exposed by abler critics.

For the present, therefore, the writer will only deal with the cost of construction, which, in his opinion, will have to be entirely altered if tramway business is once more to become the safe and popular investment which it is in most other European countries.

As track and permanent way construction is solely influenced, or should be, by the nature of the tramway traffic, the weight of cars, and the nature of the soil, let us consider how the ideal permanent way should be constructed. The traffic depends, of course, upon the number of passengers to be transported during a given time, and this can be done either by using a smaller number of cars carrying a large number of passengers, or by using a greater number of lighter cars. This brings us to the adoption of light single-deck cars, instead of the existing heavy double deckers. The former method is followed practically all over the world, and its adoption assures the following advantages:—

1. Lighter, cheaper and more flexible track construction.
2. Quicker, and therefore more convenient and more popular service.
3. More frequent service, and therefore more profitable use of the money spent on the permanent way and rolling stock.
4. Less noise and less disfigurement of our streets.
5. Greater ease in adapting the sliding bow, which, in its turn cheapens and simplifies the overhead construction.
6. Better supervision by the conductor.

The disadvantages, or rather the apparent objections, which have been urged against the adoption of the light single decker (and trailer when required by rush traffic) in our crowded cities are:—

1. The greater length of train or car required to carry a fairly large number of passengers (more room in streets and car sheds).
2. Possible wear and tear of track, due to the greater number of cars passing.
3. Possible heavier traffic costs, owing to more wages, and more power required for the same number of passengers.
4. Absence of seating capacity for smokers, sightseers and lovers of fresh air (if no open trailers are used).

The claim that in this country the traffic is so dense that it would be impossible to run enough small cars to transport the number of attending passengers does not hold good in view of the published traffic returns. In large towns, such as Berlin, Dresden and Lyons, the traffic per mile of route is even more intense than in the corresponding towns of London, Dublin and Manchester, and, except on some of the trunk lines in these cities, single-truck cars are used. An important point is, that elsewhere passengers are allowed to ride on the platforms, and this accounts for the large number of passengers per single-truck car. There is no valid reason why the carrying capacity of our smaller cars should be thus reduced, and the sooner this mistake is rectified the better it will be for our tramways. In almost all of our larger towns a single truck can be used with an overall length of 25 ft. to 30 ft., on a 6 ft. to 10 ft. wheel base, carry 36 to 50 passengers inside and on the platforms, thus reducing the weight of the fully-loaded car from 9 to 12 tons. The effect of more but lighter cars on the track will be found to be entirely on the credit side, as the weight hammering the joints which ruins the track, and also the wear of the rail surface.

The heavier wages bill caused by the larger number of drivers and conductors is another of those imaginary drawbacks which is in no way substantiated by evidence. It is true that a few more men

* Abstract of a Paper read at the Congress of the Tramways and Railways Association at Edinburgh, July, 1911.

Digitized by Google

be employed, but their number will prove much less than anticipated on account of the cars performing more work, stopping less, and therefore easily earning the increased wages bill. It has been the writer's experience in running tramways abroad, that the objections 2 and 3 are not confirmed by actual practice, provided passengers are allowed to ride on the platforms. The last objection is the only real one, and one on which it is difficult to argue. Riding on the platforms may help towards contenting some of the grumblers on short sections. For longer trips, a semi-convertible car, and cars with open smoking compartments will go a long way. Incidentally, the writer may be allowed to again refer to the use of trailers, so common on the Continent. No one will, of course, contend that their use should be encouraged indiscriminately, but the veto of the Board of Trade is a far too drastic measure, and is one of the reasons why our tramways do not pay. They certainly are not beautiful, but they

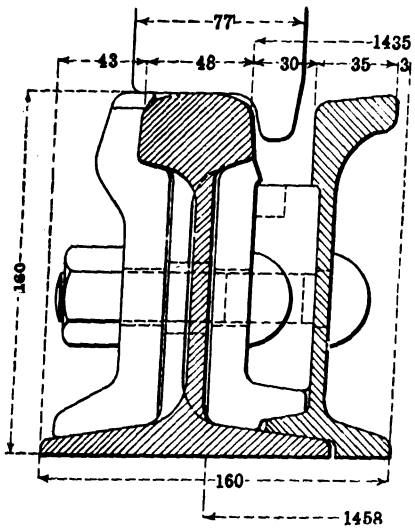

FIG. 1.—RAIL SECTION, AMSTERDAM TRAMWAYS.

are useful; they are far less objectionable, if properly used (in towns, not more than one), than top covered double deckers. They are not more dangerous if provided with proper side guards, and they are dividend earners. Moreover, they are a necessity at special rush hours, on Saturdays, with workmen's cars, &c., and they should certainly be allowed where their introduction can be substantiated, especially on suburban lines.

The writer is quite willing to concede that in general the double decker has a smaller deadweight per *seat*, that with trailers an extra conductor is required, and that the current consumption per seated passenger may, under certain circumstances, be slightly greater. Also that with the double decker more weight is available for adhesion and that thereby quicker starting and accelerating are obtained. These differences, however, are only very small, and they need not tell in favour of the double decker at all, as the following reasoning will show. The weight on the track is more evenly distributed, hence much less wear at the joints. The double deckers must be of

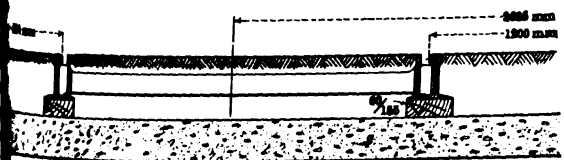

FIG. 2.—TRACK CONSTRUCTION OF AMSTERDAM TRAMWAYS.

heavier construction, their centre of gravity being high. They require a wider gauge than single deckers for the same reason, hence the absence in this country of the much cheaper metre gauge. They also prevent the use of platforms for carrying passengers, and their adoption precludes short radius curves.

The writer holds that these many disadvantages are of far more importance than the insignificant drawbacks of the single-deck car mentioned above, and, moreover, he contends that one conductor in case of heavy traffic with double-deck cars is not sufficient. The chief advantage claimed for the light single truck single decker is the reference to the track. Our track construction is, in the writer's opinion, the reverse of what it should be. It is costly, the latest being on the London United Tramways costing over £13,000 per mile of double track, but it is also unsuitable. Our heavy double cars have been largely instrumental in producing this evil.

The entire construction of heavy rigid trucks riding on rails resting on a "would-be" rigid bed is faulty. That this is not yet recognised by leading tramway men is shown by the efforts to make the contact between rails and bed still more rigid, by introducing anchors or other metal in the concrete at a prohibitive cost. The writer is inclined to think that the return to an improved flexible track is an urgent matter which should not be further delayed. It will be found in many cases on opening up the concrete under the joints that hardly any concrete is left, it having been pounded into a powder and washed away by the surface water. The action of the anchors, and other sole-plate combinations, has only accentuated this evil. It is also a fact that the concrete carries no weight except when cars are passing. Lighter cars will alleviate this to a certain extent, but more is needed. Wooden sleepers laid on about 4 in. to 6 in. of concrete form an ideal track, but in many cases, where the ground is favourable, the concrete and sleepers may even be omitted. Paving difficulties have, of course, interfered with this type of track construction, but they can easily be overcome.

As to damage by abnormally heavy traffic, the Board of Trade might issue regulations that traction engines and carts over a certain weight should not be allowed to use the tramway tracks.

Moreover, the movement of the rails on cross-sleepers is much smaller than is generally accepted. In Chicago, careful and frequent measurements disclosed a maximum horizontal deflection of only $\frac{1}{64}$ in., and a maximum vertical deflection of $\frac{5}{64}$ in., with sleepers at 4 ft. centres, and tie plates under the rails. It was also observed these figures were not influenced by the speed but by the weight of the cars only. There was no movement in the paving at all.

Longitudinal wooden sleepers, cut away under the joints, have also often been used with success. In one of the latest large tramway

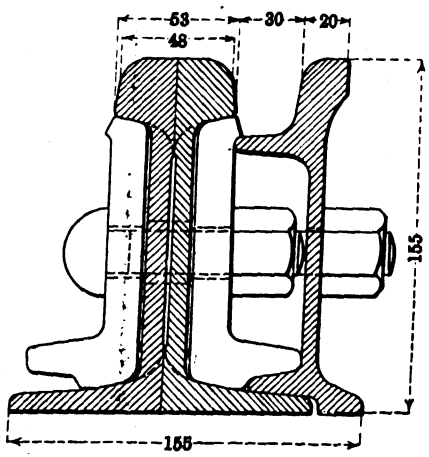

FIG. 3.—RAIL SECTION, THE HAGUE TRAMWAYS.

undertakings abroad, where the writer acted as consultant, a heavy rail of the double or "Haarman" type was adopted weighing 126 lb. to the yard, and simply laid in trenches filled with sand and well rammed; concrete being only used under the special work and in asphalted streets. This construction was in soft and bad ground, but it has stood well for over six years. The joints were sprung and slanting. Where concrete stringer construction is used, no concrete should be put under the points, which may be either of the combined sole plate type, or welded. The weight of the rails should not be decreased, but the flange might be slightly widened. Near the joints two cross sleepers will form a flexible support.

Light cars are, however, a *sine qua non*, and apart from their other advantages, they should be introduced on the score of facilitating a cheaper and better track construction. A track of this type should not cost more than £3,000 per mile of single track, exclusive of paving. It is, of course, a well-known fact that paving is the heaviest item in our tramway construction costs, and it is difficult at present to reduce the amount expended under this head in the busier and larger towns. There are many smaller towns, however, and it is to these that one has to look for further tramway development.

Some of the other advantages are evident. A quicker, and therefore more convenient and popular service can be given, and thus a more profitable use of the sums spent on the permanent way and rolling stock. Less noise and less disfigurement of our streets will be evident to all those of our engineers who have visited towns such as Frankfort, Dresden, The Hague, Amsterdam, Lyons, Cologne, &c. Although the cars pass along the streets in a continual file there is a total absence of the deafening noise which accompanies the progress of our heavy cars. This is not a sentimental point but a very real one, having regard to property owners along the routes.

As the author hopes to prove further on, the adoption of the sliding bow is one of the points which would also favourably affect the construction and running of our tramways. On single deckers the bow can be fixed so as to obviate the necessity of swinging it over at the end of the trip, and no heavy standards and long arms are required, thus greatly cheapening the whole construction. Another advantage, which up till now has not received much attention, is the power consumption at the power station. With many light cars the power curve at the power station will approach more nearly to the straight line than with fewer heavy cars requiring a heavier starting current. Examination of one of the power curves of one of the large Continental power stations will disclose a far more equal appearance than those, for instance, of the one of the Glasgow sub-stations.

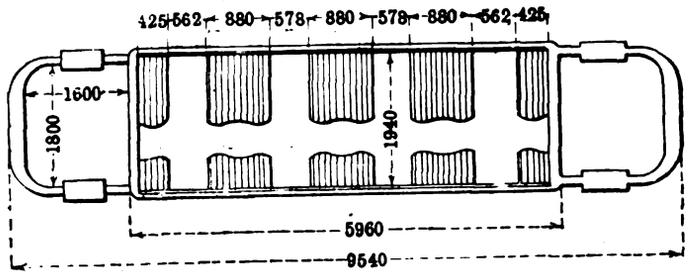

FIG. 4.—VIENNA TRAMWAYS MOTOR CAR SEATING 24, AND 20 STANDING. (Plan, dimensions in millimetres.)

It is true that the more extensive use of batteries on traction loads on the Continent is primarily responsible for this in most cases, but even in stations where no traction batteries are used on account of the great number of cars, the difference is at once evident. This means, of course, smaller units running at their most economical loads, and therefore at a better steam consumption.

The tables give comparisons between a few Continental towns and more or less corresponding towns in England. In the towns mentioned the number of trailer-car kilometres run was about half that of the motor-car kilometres, except in Vienna, where the numbers were about equal. On an average, therefore, each car may be considered to consist of one motor-car plus half-trailer, or a capacity of well over the capacity of our standard double-deck car, viz., 56. The power consumption, however, is much less, as two trailers are taken as being equal to one motor-car kilometre. If we take, therefore, 1½ motor-car kilometres, we get about 0·625 units for Amsterdam, 0·525 units for The Hague and 0·665 units for Leipzig, or a little more than half our figures with the double-deck cars. This is not entirely due to the lighter cars, but also to the wider rail groove used abroad. The passengers carried on the platforms are, of course, includ... calculating the capacity of the cars, as standing room is the m... sought-after accommodation abroad, and this seems to have be... lost sight of by our experts when discussing this point.

The few figures given with reference to track and overhead equ... ment maintenance also go to support the writer's remarks under th... heads. The Continental figures for passengers per car-kilome... must also be increased by 20 per cent. for the trailer cars, and w... then be found to differ but little from their British equivalents.

The latest convert to the flexible track is the city of Munich, wh... a recent International Tramway Congress was held. The rea... given by the authorities is that the removal of the concrete ... reduces the noise and prevents corrugation. The writer would c...

plete these claims by adding reduced repairs on track and car... and equipments (commutators). In Munich the track is being... in all paved and macadamised streets on pine sleepers saturat... carbolineum, at intervals of 4 ft. embedded in gravel. Hea... are, of course, used (120 lb. per metre). The two axle single ... on this track are 29 ft. long overall, with a capacity of 20 sitt... 20 standing passengers. The weight of this type of car is onl... unloaded. This car with closed-in platforms is, in the ... opinion, admirably suited to English conditions.

An extremely light car has been introduced on the Vienn... ways, the weight unloaded being only 5 tons and the overa... 27 ft. The total seating capacity is 22 passengers. The eq... consists of two 25 H.P. motors giving a speed of 26 km. per h... two trailers. The current consumption is 25 per cent. less t... the other cars on that system, and the beneficial influence on ... of the track need not be questioned.

There are, of course, quite a number of details which ... introduced with advantage in our car building, all calculat... crease the weight of our cars, a point which, in the writer's ...

Digitized by Google

has been rather neglected by those responsible for the management of our tramways undertakings. A few might be mentioned here :—

(*a*) Aluminium side panels, by which a saving of 300 kg. (6 cwt.) can be obtained.

(*b*) The use of steel side *members*, and metal cross pieces.

The weights so reduced would, if radial trucks were adopted, give about 28 seats of 500 kg. (10 cwt.) per seated passenger ; or 275 kg. (5½ cwt.) per standing passenger with 0·25 sq. metre (2½ sq. ft.) on the platforms.

(*c*) The use of the sliding bow, with corresponding overhead construction.

(*d*) The use of wall rosettes where possible.

(*e*) The use of a flexible truck (Warner type or other).

(*f*) The introduction of " pay as you enter " cars.

(*g*) The use of trailers where possible.

The frequent service in our larger cities and the many lines in the centre of these cities have caused the use of heavy contact wire, and numerous frogs, crossings and switches. Also many poles, bracket-arms, insulators ; in short, the unsightly ironmongery ware which disfigures our public squares and main thoroughfares can be traced to the blind following of trolley wheel practice. This heavy gear and the excessive upward pressure of the trolley boom are responsible for the adoption of heavy and unsightly poles duly standardised as embodying our views on modern tramway construction. It is also admitted that nearly 80 per cent. of the accidents on our electric tramways are caused by the trolley wheel in its evolutions on and off the wire.

A third point is the quick wear of the trolley wire, especially at the points of suspension and on curves. The wear of the trolley wire, as far as ordinary tramways are concerned, has been proved to be much less with the sliding contact, of course due to the lower pressure and aluminium lubricated lining of the bow. The total absence of hammering action at the points of suspension, and of cutting flange action, also account for the increased life of the contact wire.

Curiously enough, this is about the only point on which the critics have pronounced judgment, and probably simply on the score of rubbing friction against rolling friction, the judgment has been adverse. The joint experience of over 50 Continental tramway systems is, however, entirely in contradiction. The writer has in his possession a piece of wire taken from the Dresden tramways and cut out from one of the curves after nine years' use at a spot where nearly 500 cars pass daily. This only shows a slight flattening at the lower side.

From personal experience the writer would go as far as to say that on busy lines a life of 9 years is quite normal with the bow and 000 wire. That is evident in view of the methods of suspension with the sliding bow system, and the absence, if figure 8 or other profile wire is used, of all hammering at the points of suspension. The life of the trolley wire being governed by the condition of the wire at the ears only, for that reason alone, be considerably longer than with the trolley wheel.

The continual bending of the wire at the ears is a trouble that has been due to the fact that the trolley heads are heavy and have increased in weight ever since they were first introduced. The pressure with which they are held against the wire is about five times as much as with the sliding bow, which is a light construction, especially the top part. The trolley head is therefore a real hammer striking each time with vigour and pressing the wire upward with great force when nearing the ears. On account of the heavy ears, crossings, frogs, &c., the wire is dropped again heavily after the passing of the trolley, another evil which occurs in a far less degree with the much lighter overhead construction used with the sliding bow.

Briefly, therefore, the advantages of the sliding bow may be briefly stated as follows :—

Absence of overhead switches, frogs and crossings.

Far lighter overhead construction, such as small mechanical ears for insulators ; use of lighter poles and brackets, &c., owing to the small upward pressure (7 lb. to 9 lb.) and to the absence of heavy ears at suspension points.

Fewer suspension points and poles, owing to the absence of the necessity of following the centre of the track. It is true that with us the trolley does not require to follow the centre of the track, but the trolley with its heavy swivelling head is a source of trouble.

The possibility of the bow to de-wire.

Ease with which it can be reversed at terminals.

Smaller wear and tear on the trolley wire (greased aluminium lining) and decreased maintenance costs due to the absence of hammering effect at the ears, and consequent absence of sparking. Figures for maintenance of the bow in Vienna and Dresden is 0·1 penny per car kilometre.

As a flexible truck, the Warner truck is undoubtedly a step in the right direction towards the realisation of the idea of a flexible truck (flexible in relation to car body).

With regard to pay-as-you-enter cars, in Montreal the receipts have increased by 31 per cent. on these cars. Of course, the more uniform fares in the States make the adoption of this system easier than in our case, but the large preponderance of penny fares and of uniform fares on our suburban lines do not offer any serious objection. The average running speed seems to have increased 13 per cent. in Montreal since the introduction of the new cars.

The question of higher fares is of course the only recognised source of increased net revenue. The writer ventures to make the following suggestions to meet this difficult point. One penny to be the minimum fare, but only obtainable by the use of strip tickets bought in advance, and a universal twopenny fare for any distance under 5 miles, and giving the right to one change of car.

The writer has tried to show in the foregoing remarks that some alterations in our methods of constructing and working electric tramways are urgently required if the industry is to be placed on a firm basis from the point of view of the private investor. Large additions to the mileage of our suburban and inter-urban tramways are waiting development, but unless cheaper, and, let us say, better adapted methods of construction are introduced, new tramway business will be exceedingly difficult from a financial point of view, to the great detriment of our electrical industry, and of the dwellers in our small towns.

CONFERENCE ON EDUCATION AND TRAINING OF ENGINEERS, 1911.

(*Continued from page 547*).

Prof. Petavel's paper was as follows :—

THE RELATION OF ENGINEERING EMPLOYERS AND COLLEGES FROM THE POINT OF VIEW OF THE PRACTICAL TRAINING OF COLLEGE STUDENTS.*

BY PROF. J. E. PETAVEL, D.SC., F.R.S.

A good general education, a wide scientific knowledge, and a sound practical training constitute qualifications essential for success in the engineering profession. The engineering employer and the university teacher are therefore co-partners jointly responsible for the success of the educational work ; and it follows that some close co-operation is eminently desirable. Any discussion of the relationship between employers and teachers must be primarily based on some definite understanding with regard to the aim of university teaching and the qualifications attainable by the average college student. On both these questions a considerable divergence of opinion exists, and it is merely with the object of providing, as briefly as possible, a basis for systematic discussion that the following apparently somewhat dogmatic statements have been drafted.

1. A boy intending to qualify as a civil or mechanical engineer would pass the university matriculation examination at the end of his school career and afterwards spend a year in a mechanical workshop before entering the university.

2. The university teaching should be scientific in its nature and wide in scope. A reasoned discussion of present practice and future possibilities should take precedence over merely descriptive treatment. The student should be taught to understand fundamental principles and make an intelligent use of mathematical analysis, not to memorise unimportant details and empirical formulas. Finally, early specialisation should be discouraged. The educational work of the university is brought to a successful termination when the student has been taught how to learn.

3. The object of the engineering laboratory is to afford illustrations of the principles referred to in the lectures, to familiarise the student with the methods of testing materials or machines, and to prepare him for the practical training which it cannot replace.

4. The university degree implies a certain standard of work, knowledge and intelligence, but the ultimate success of the graduate as an engineer will depend primarily on his personal characteristics, and secondarily on the opportunities offered him during and after his practical training. The engineering employer cannot anticipate that a university graduate would be of much assistance during the first few months, but should require him to reach a satisfactory standard of efficiency before the end of the first year, and expect him to deserve some reasonable remuneration during his second year.†

5. The head of an engineering department is always glad to select and recommend a man suitable for any position which is offered.

6. The engineering employer can co-operate in the educational work of the university by a frank and friendly criticism of the methods

* Abstract.

† The second year after graduation as explained in paragraph 1, the third year of practical experience.

Digitized by Google

adopted. By offering to take college gradutes on a six months' trial he can form a personal judgment of the qualifications of the men and select those best suited for the work he requires.

Mr. ALEX. SIEMENS (London), speaking as an employer, dealt with the last two points raised by Mr. Horne. Manufacture was essentially carried out for profit and for this reason pupils could not be taken into works regularly and educated. His firm took pupils when they had a vacancy, but not otherwise. It was impossible owing to works organisation for apprentices to go to school two afternoons a week; they might as well leave altogether. But for bright boys of this kind bursaries had been established by the Commissioners of the 1851 Exhibition.

Prof. G. KAPP (Birmingham) said the bursaries mentioned by Mr. Siemens were for graduates alone. The system advocated by Mr. Horne was already being carried out in Birmingham for boys from secondary schools. He was a believer in the sandwich system, but the trouble was that the slices were too thin. Many employers would take boys into works even for short periods, and the result was good in that they made the student more receptive. Four years at works and then three years at college made the slices too thick; the best way would be to have a year at works then one year at the university, another year at the works, another year at the university, a third year at the same works; and, lastly, a third year at the university.

Mr. F. ZUR NEDDEN, comparing English and Continental methods, said that 12 years' experience in Germany had shown that a year at works preliminary to college training was a satisfactory arrangement. A code of rules had been formed with this end in view. These were signed by the manufacturers who declared themselves willing to take the students. Where the trouble occurred was that the universities had money for training purposes, while engineering firms had no such funds and had besides to make money. More combination between the universities and factories was required. As a recompense for the facilities he received the student agreed to serve all his apprenticeship at one works and at the end of his studies to remain in the shops six months to give the manufacturer an option on his services.

Mr. J. F. C. SNELL (London) thought any break between school and university was undesirable, and that the sandwich system was at best a compromise. It would be better to take the university course first and then the shops, as workshop knowledge was more easily absorbed when the student was older. He thought that not sufficient stress had been laid on the importance of drawing-office work. He considered it would be a good thing if the Institution appointed a committee to confer with the educational authorities and manufacturers on this question, and to watch over and help the students.

Mr. B. HALL BLYTH said that the civil engineer worked for his employers and not for students. He objected to the idea that when a student left college he was a fully qualified engineer; and four years was not overlong for practical work.

Principal J. WERTHEIMER (Bristol) wanted to know why it was that every student turned out of the Boston and Massachusetts School of Technology was sure of a salaried post at once. Perhaps it was because our system of education was not so successful as in the United States. Unsuccessful undergraduates should not be encouraged to go on with their course. The Bristol City Council were providing bursaries for such artisans as desired to prepare for the engineering degree.

Sir WM. WHITE (London) thought the conditions here and in the United States were essentially different. The reason that young men did not get work here was not due to the teaching, for if they went out to the United States they at once got posts. Some means were necessary to discover whether a boy was suitable for an engineer. That was why the year's preliminary training in works had been recommended. Practical experience must be paid for by the student.

Mr. H. J. SPOONER (London) thought that a good case could be made out for the college workshops, as a great deal of useful work could be done there. It was also a relief from the brain work, and the technical side of many mechanical operations could be taught.

Prof. S. P. THOMPSON, F.R.S. (London) said he had not found practical engineers against college training as Dr. Unwin had. They were, in fact, more eager to get college-trained pupils than to pay them. He differed, too, from Mr. Snell, in that he preferred to have a boy who had been a year at works before coming to college. He was of more use then. To him the two years' course at Finsbury seemed ideal. It could easily be interposed between the school and workshop, or after the school and workshop. Many pupils were glad to take a two years' course, and there was the further advantage that all striving for degrees was thrown over.

Mr. W. H. PATCHELL (London) thought it was demoralising to a boy to make him a supernumerary in works, and that was what occurred if he went there in three monthly spells. He considered more funds could be obtained if the money now available was spent more judiciously. Not enough was spent on the better boys.

The joint meeting then adjourned, and Section II. held a meeting in the library under the chairmanship of Mr. W. H. Maw, when the following Papers were read and discussed:—

THE VALUE OF A UNIVERSITY DEGREE IN ENGINEERING SCIENCE IN RELATION TO PROFESSIONAL COMPETENCE.

BY PROF. S. M. DIXON, M.A.

The competent engineer is one who can deal effectively with materials and men. While it cannot be claimed that three or four years' good work at an engineering school gives this competence, still it can be shown that for the ordinary man it is the best method of obtaining the necessary preliminary training, and so the university degree becomes the first step of a long ladder leading to eminence in the profession.

The training of the engineer may be divided into theoretical and practical, but this is merely for convenience in discussion, because the two divisions can never be separated entirely. Speaking broadly, however, the theoretical part, or basis, of the engineer's education is that which is more or less complete, as far as most men are concerned, when they receive the degree in engineering. The practical part of his education beginning at college should continue as long as the engineer remains in practice.

While it has been said that both sides of the engineer's training begin at college, there is no doubt that the work carried out for the degree must deal mainly with principles, and should be as broad as possible. Details of current practice will be noticed only as illustrations of principles. In dealing with materials the engineer needs a knowledge of mathematics, physics, and chemistry, and if he is to avoid mistakes his knowledge must be very exact and at his fingers' ends. The courses in mathematics, physics, and chemistry naturally lead to those in surveying, stresses in structures, and properties of materials. All these are technical subjects, it is true, but they can be far better and more easily taught in the class-room, field, laboratory, and drawing office of a university than in the engineer's office. When the student has a sound knowledge of the principles involved in the study of these subjects he will make rapid progress in the details of practice.

Instruction in the above subjects, important as it is, should form only part of the general education of the young engineer, if he is to be fitted to hold more than a subordinate position in the engineering profession, for, as stated earlier, the engineer must deal with men as well as materials.

A liberal education is essential: literature, history, philosophy, all subjects which tend to broaden a man's outlook should be studied, and this is even more necessary in the case of engineering students than in the case of those who intend to follow other professions. Of course, unless a university education leads to further reading and research, one of the most desired objects is not obtained: but, owing to the nature of his employment, the engineer frequently has for several years few opportunities for reading outside his work, and so should make up for this by the keenness of his interest in these so-called "outside subjects" while at college. We take it for granted that the successful man in any other of the professions will be one who has already made his mark at the university, and it is certain that the success in a great measure is due to the trained ability which enables the possessor to influence his fellow-men. The general culture which comes from college life as well as from college study is an asset in the engineering profession not to be despised and not easily obtained. The man who leads his fellow students in the class-room, in sports, or in the debating society, is equipped in a very real way for success in his profession.

The work done at engineering schools is serious and painstaking. Much has been written lately about examinations and degrees in engineering, but those familiar with the work of engineering colleges can testify that the profession has no reason to fear that the status of the civil engineer will not be upheld by the graduates in engineering. The final examination is but a very small part of the requirements for a degree. Three or four years of solid work under personal teaching sifts out a large proportion of those entering on the courses, while at the same time few students who possess industry and average ability should fail to satisfy the present requirements in the specified time.

No system of education is above criticism. If we take an interest in the objects of the system we should see that our criticism is fair and helpful. At present the university method is recognised as the only generally applicable method in every country but our own. The objections to the system in this country may be found stated by two classes of engineers: those who have in their early days entered university courses and then dropped them before grasping the meaning of the instruction offered, and those who have risen to eminence in their profession before university training in this country became general. The former are answered by the fable of Æsop of the fox who tried to make the best of a serious accident; the latter are reminded that competition in the profession is becoming keener every day. English engineers now find in every country friendly rivals who have spent a large part of their time at engineering colleges, and it would be unjust to the rising generation if they were not able to start with advantages equal to those of their competitors. It is not long since it was usual to find, in some of the larger engineering schools in America, English students attracted by the superior equipment and facilities for research. At present our students are more fortunate. At home they can, at well-equipped colleges, receive instruction which is admitted to be efficient and

Digitized by Google

up to date. In fact, the stream of students from newly-developing countries without engineering schools of their own is being in part diverted from the United States to this country.

In arranging this discussion on engineering education by members of the profession who have already attained eminence in its practice, the council of the Institution had evidently in view the one difficulty which exists for the moment in England. While in other professions a university degree is regarded as the first requisite, and so leads directly to employment, there is still a feeling in some quarters that the university graduate is rather in the way in an engineer's office. Matters, however, in this way are improving. Once engineering firms recognise the advantage of having assistants thoroughly trained in the principles underlying practice, and whose training also specially fits them for adopting new ideas rapidly, they will only be too glad to co-operate with the universities in completing the education of the engineer. A method already adopted on some railways in the United States and in Australia has been in work for some time on at least one railway at home. In this case we have the principle of co-operation firmly established, by which the college graduate obtains his practical experience in the best way possible. Entering the service of the company under a small but gradually increasing salary, the graduate in engineering is under agreement to stay a specified time. During this period the engineering staff of the company consider that there is an obligation on their part to see that the duties of the junior assistant are so arranged as to give him a wide experience. One railway company in the United States reports that the services of men so trained by them are so eagerly sought by other companies that they cannot satisfy the demand. This principle of co-operation might be extended largely, and the greatest gainers in the end will be the employers, while at the same time the status of the junior engineer will be greatly improved; and not only this, but by the interest thus taken in engineering colleges by engineers in practice, modifications in the courses may be suggested, and students will be encouraged by the knowledge that the training, the successful conclusion of which is indicated by a degree, is recognised by the leaders of the profession as the right and necessary preliminary to practice.

THE VALUE OF A UNIVERSITY DEGREE IN ENGINEERING SCIENCE IN RELATION TO PROFESSIONAL COMPETENCE.

BY PROF. C. F. JENKIN, M.A.

In order to estimate the value of a degree in engineering science it is necessary to understand clearly what the possession of the degree means. It means that the graduate has spent some years in passing through a carefully arranged course of study in those fundamental subjects which should form the basis of engineering education, and also that he has attained a certain standard of proficiency in them, as far as that can be tested by examinations.

It is no longer necessary to urge the importance of theoretical training. Engineering education should consist of three parts: a basis of general scientific study; a middle structure of applied science, that is of science specialised, extended and adapted with a view to its bearing on professional practice; and lastly, that kind of knowledge of practice which can be gained only by coming directly in contact with it. This is now recognised by the Institution of Civil Engineers, which requires proof that applicants for admission shall have had both theoretical and practical training. The latter can only be obtained by an apprenticeship or its equivalent, and I sincerely hope that the Institution will always maintain its requirements in this respect, and not accept a knowledge of college workshops as equivalent to a knowledge of real practice, which it can never be. I am aware that much that is useful can be taught in college workshops, but I believe that it is better for the student to learn these things in the real shops, where he will at the same time acquire a fund of practical experience which he cannot in college.

The first part of the training—the theoretical part—with which we are specially concerned, can be obtained more or less efficiently in various ways. It is this part which the entrance examination is intended to test, but a degree is a very much better proof of the possession of a good theoretical training than any examination can be. This is the first reason I would bring forward for regarding a degree as of value. That an examination is, in general, a poor expedient for ascertaining a student's proficiency is becoming more widely recognised every day; it is, however, less unsatisfactory when held on the completion of a definite course of study than when it is used as a test for general scientific knowledge. Further, the degree course contains much that cannot be included in the examination at all; for example, much of the student's time is spent in the laboratory learning how to measure accurately all sorts of physical quantities, and to carry out tests on all sorts of machines—steam, electric, hydraulic, &c. The value of laboratory training, which can only be obtained in a college, is very great; to quote my father's words, "There is no teaching more practical, more immediately fertile in results than that which can be given by the man of science in his laboratory." Again, there is the teaching in the drawing office where the student learns to use his theory in the preparation of actual designs, and the field course of surveying, during which he learns to handle his instruments skilfully and accurately. These are all implied in the degree, but it is almost impossible to take any account of them in an examination.

The value of a degree may be considered from another point of view. What training is best for the boy when he leaves school—best in a wide sense? Is it better for him to go to college or not, for this is what the degree implies? To spend some years at a university is an education in itself and will be a permanent asset in the boy's life. This general cultivation is the feature of all university life—especially perhaps in the older universities. It is a matter on which we may congratulate ourselves that the two oldest universities now open their gates to engineering students.

The value of a degree may be considered from a third point of view. Sir James Inglis, in his presidential address in 1908, said: ". . . it ought to be laid down as a principle that all public money derived from rates and taxes should be, so far as it is applied to engineering construction, expended under the direction or control of definitely qualified engineers, as is already the case in many countries." If the engineering profession is to be brought under State control, as medicine is, and also the law—in a modified sense—it would appear to be wise to make the basis of qualification as broad as possible by recognising the engineering degrees of the universities as a necessary qualification rather than a certificate by a single institution, even though that institution were our own.

An engineering degree then may be looked at in three lights: As a guarantee that the holder has had the best theoretical training and has profited to some extent thereby; as the final step in that type of liberal education at the universities of which England is justly proud; as a broad basis on which State recognition of our profession may be founded. The regulations drawn up by the Institution for the admission of students and members are wisely framed at present so as to recognise many different types of training, but if the reasons I have advanced in favour of the engineering degree are valid, it would be well for us to look forward to a time, not too far distant, when the possession of a degree shall be a necessity in engineering as it is in medicine.

DISCUSSION.

The CHAIRMAN, in opening the discussion, hoped that employers would give their views on the value of a degree to the student. In his opinion the value was at present small. The commercial value of a man depended on many factors, not all connected with college work. A graduate might be expected to advance more quickly than a man without a degree, or if he did not there was something wrong with the training, or he had spent too long at it.

Prof. J. A. FLEMING, F.R.S. (London), said that the value of a degree was at present small. Its essential vices were that it was too largely obtained by passing examinations which took place in three-hour sections without books and whether the student was well or not. Not enough attention was paid to practical work. In life, an engineer's efficiency did not depend on his memory for facts or on his ability to work against time. The qualities which a student had to cultivate to pass examinations were not the qualities he would afterwards want. There was too much working for the degree, in which there was no value as an end in itself. Education ought to tend to the development of qualities of reliability, resource, accuracy, and towards making good with imperfect means. Only first principles should be taught and *viva voce* and practical examinations should be cultivated. Letters as a sign of graduation should be abolished, a diploma taking their place.

Mr. DUGALD CLERK, F.R.S. (London,) said his experience with graduates was not so bad as Prof. Fleming's. He agreed, however, that they were not much good in works at first. Many so-called practical men had really a good scientific education, at any rate as far as his own work was concerned. A university man was often difficult to get on with as he was likely to be conceited, but he was useful when he had been broken in. Engineering work in the past had been very efficient, but not of a very high order.

Mr. A. P. TROTTER (London) thought no degree ought to be given for professional work. He had been on the Board of Studies of the London University, but he soon became quite out of sympathy with them. Their ideas were too "post-graduate." General principles only should be insisted upon at universities, such as physics, mathematics, chemistry and geology specialised to engineering requirements.

Col. B. R. WARD, R.E. (Chatham), thought a good sound general education was of importance to the engineering student. Engineering subjects by themselves provided only half an education and not too much stress should be laid on the technical side.

Mr. JAS. GLOVER (Lowton) thought general principles only should be inculcated at a university, for lack of principles could never be made up afterwards. A degree was of value and was worth working for.

Prof. S. P. THOMPSON, F.R.S. (London), said a degree had no face value, its worth depending on the work behind it. In London the running after degrees was a curse and was doing great harm. An A.R.S.M. or A.C.G.I. ought to carry ten times the weight of any degree.

Dr. W. C. Unwin, F.R.S., then took the chair, and the following Papers, of which we give abstracts, were read :—

THE POSITION AND USES OF ENGINEERING LABORATORIES IN RELATION TO EDUCATION AT COLLEGE.

BY PROF. W. E. DALBY, M.A., B.SC.

The outstanding feature of our modern system of scientific education is the laboratory. It is now recognised as an essential instrument in all branches of scientific education. The reason is not far to seek. In a lecture room a student hears things, but in a laboratory he does things ; and a normal student remembers what he does and forgets the greater part of what he hears. A youth anxious to become an engineer is generally born with a desire to do things ; and thus the material which we have to train in our engineering colleges is peculiarly susceptible to laboratory teaching. Through the work he does in the laboratory comes the desire to hear rightly in the lecture room.

An engineering laboratory may be designed from the two distinct points of view of teaching and research. The two ideas are complementary to one another rather than antagonistic, and both must be kept in view in the general design of the laboratory of a great school. From the point of view of teaching, the individual items of the apparatus provided should be numerous, typical and small, so that there may be plenty of experiments for small groups of students to carry out for themselves. For example, five 20 H.P. steam engines, each properly equipped with measuring apparatus, are better than one 100 H.P. engine. Later in the course a student may form one of a large group testing a large steam engine, but his early work on the smaller plant will enable him to perform his part with a comprehensive knowledge of what is being done by the other members of the group. He will thus do the work more intelligently. In an engineering laboratory the students must do the job and not look on while the job is being done by the professor on a large and expensive piece of apparatus too costly to be entrusted to them.

From the point of view of research, the chief provision to be made is space, time and a workshop in which apparatus can be made to supplement the apparatus, often of an expensive kind, provided for research. Any of the apparatus provided for the instructional course may, from time to time, be made the subject of a special investigation ; but, in such an event, it must be withdrawn temporarily from the routine work of the laboratory.

The equipment of an engineering laboratory cannot be specified without a clear idea of what it is that we aim to teach. Amongst the many things that may be put down, three, I think, stand out clearly—namely, the fundamental principles on which engineering science is based, the physical properties of the materials of construction, the methods of measuring energy in the many guises it assumes.

The fundamental principles upon which engineering practice is based are few in number, but their applications are almost infinite. A principle can only be thoroughly grasped through a study of its applications. Hence to engineering students a principle should be taught by means of applications selected from those which have a bearing upon engineering. The engineering teacher has a vast and interesting field of applications from which to make his selection, and the suitability of his choice will depend largely upon the extent of his scientific knowledge and practical experience.

All students of engineering should gain some familiarity with the physical properties of steam and gases and with the materials of construction. There should be a complete equipment of small testing machines in order to provide for numerous individual experiments simultaneously, together with some large machines for research work. The fundamental principles of thermo-dynamics should be taught through their applications to estimate the efficiency of heat motors of all kinds. There should be a full equipment of heat motors, each motor being small enough to be entrusted to a group of two or three students, together with a few large engines and typical steam plant for the more extended study of the subject.

Time prevents me from enlarging on the educational value of the work in the electrical laboratory. The elusive nature of the agent with which electrical energy is associated makes the work both fascinating and absorbing.

Above all, in passing through the course, the student should catch something of the spirit of research which should brood over every engineering laboratory, from the smallest to the greatest.

THE OBJECT AND USES OF ENGINEERING LABORATORIES IN RELATION TO EDUCATION AT COLLEGE.

PROF. J. GOODMAN.

It is well at the outset to recognise that the equipment and scope of an engineering laboratory differ essentially from that of a college workshop. The work carried on in the latter is mainly for the purpose of teaching the art or trade of engineering (as to whether such workshops should be attached to colleges or not is a much debated point upon which very definite opinions on both sides are held), but the work done in the former has the sole object of teaching the principles which underlie that art or trade.

However able a teacher may be, it must often happen that students do not get a thorough working knowledge of a subject from attending a course of lectures ; if, however, properly-schemed laboratory work can be arranged to run concurrently with the lectures, the student is brought more closely into touch with the concrete side of his subject, and thereby not unfrequently discovers his own shortcomings.

Amongst other important phases of laboratory work the following appear to be worthy of special note : The engineering laboratory affords the student an excellent training in the carrying-out of experiments for the purpose of obtaining accurate data, and he cannot fail to be early impressed with the paramount importance of keeping all the conditions of the test constant except the two variables under consideration. He, moreover, discovers that absolute accuracy in data is rarely, if ever, attainable, and therefore the use of many significant figures is not only absurd but tends to deception.

In certain cases the laboratory work is valuable in showing how far theory and experiment agree, but great care is necessary in order to prevent students jumping to the conclusion that there is actual disagreement because their own imperfect, inaccurate experiments do not give the results that the theoretical treatment would lead them to expect. It is, however, believed that it is a mistake in the first instance to insist on students worrying about minute accuracy.

Before purchasing apparatus for the equipment of an engineering laboratory it is of great importance that a general scheme should be drawn up, setting forth definitely and clearly the lines on which the proposed work is to proceed ; in the author's opinion the aim should be to make all apparatus as simple as possible, and each piece should be designed to bring out clearly one particular point, all unnecessary complication being dispensed with.

The experimental steam engines found in college laboratories are frequently fitted with a maze of intricate appliances for the purpose of enabling the engine to be worked under a great variety of conditions, with the result that students are very liable to get erroneous ideas as to the essentials of any given type of engine. Such engines are necessarily not stock articles, hence they have to be specially constructed for the purpose, and are therefore very costly. The author suggests that it would be better in every respect to purchase two or three commercial engines of different types for testing purposes rather than crowd so much complication on to one experimental engine.

In all tests where a great variety of conditions may prevail, it is impossible, on account of time, for one group of students to work under each set of conditions, therefore it appears to be desirable that a definite scheme of testing should be drawn up, which may possibly take years to complete ; then, as each result is obtained, it should be plotted on a squared paper chart exhibited in the laboratory, thus enabling each group of students to benefit by the results previously obtained. If isolated tests are made under random conditions they are robbed of much of their educational value, and the results obtained are of little or no permanent value.

The extent to which stereotyping should be allowed in the work of an engineering laboratory is one well worthy of the most earnest discussion ; all will be agreed that it is an utterly bad system to have the apparatus required for each experiment set out permanently in working order, and to give printed detailed instructions and log sheets to each student, which he mechanically follows. The following of such a system entirely crushes all originality, and makes the student into a mere machine. In the early stages of the laboratory course some approach to this system may be tolerated perhaps—that is, during the period in which the student is learing to take and book observations ; but after he has once got over the initial stage he ought to rig up his own apparatus, check it for accuracy, make out his own log sheets, and reduce his results. Of course, he requires more supervision when working under such conditions, but he certainly gains experience of a far more valuable character than under a stereotyped system.

The staff of an engineering laboratory usually consists of a director with one or more assistants and skilled mechanics. It is of vital importance that the director should be a man familiar with practical work, or he may unwittingly encourage students to play with unreal problems, which tend to divert their attention from the actual difficulties that arise in the life of an engineer.

THE POSITION AND USES OF ENGINEERING LABORATORIES IN RELATION TO EDUCATION AT COLLEGE.

BY PROF. B. HOPKINSON, M.A., B.SC., F.R.S.

The position of the engineering laboratory as an instrument of education is not quite the same thing as its position in relation to research, but is closely related to it. In a discussion, some 20 years ago, on the proposal to establish an Engineering School in Cambridge, it was pointed out by way of justifying the innovation to that ancient University that it was as good an education thoroughly to test a steam-engine as to determine the velocity of light. It might well have been said that it was better, for in the engine-trial the student is introduced to phenomena under conditions which in their complexity resemble those of real life, and which can only partially be controlled. He can vary steam-pressure, load and perhaps speed, but he cannot within the limits of an ordinary trial control such important factors as the dryness of the steam supply, or the temperature of the cylinder walls. Thus he learns in a simple way to use his judgment in interpreting data, and to recognise how in a complex mechanism it is impossible to vary a single element without at the same time affecting a number of others. This training of the faculties of criticism and observation is valuable to anyone, whatever profession he is going to follow, and it cannot be obtained in the same degree from the experiments ordinarily performed by students of similar standing in a physical laboratory. To the engineering student there is the additional advantage that he sees the application of scientific principles to things of the same sort as he will meet with in after life.

These considerations, together with a frank recognition of the fact that by no possibility can the conditions of practical work be completely reproduced in the engineering laboratory, lead to a fairly definite conception of its position and uses. In the first place industrial apparatus, even of a simple character, is too complicated to be used as a means for demonstrating elementary physical laws to students who are quite ignorant of their working. Hence work in the engineering laboratory proper should be preceded by a short course of ordinary physical experiment under the simplest possible conditions. Provision is made for this in nearly all college courses, and it is unnecessary to discuss it in detail. Assuming that he has thus acquired a knowledge of the fundamental scientific principles, the student's work in the engineering laboratory will be directed largely to tracing their operation under more complex circumstances. For this purpose small units of plant of a simple character are quite adequate. Everything that such a student can learn in an engineering laboratory in the time at his disposal he can get from a 10 H.P. engine, from a 5-ton testing machine, and from plant on a similar scale in the other branches of his study. A triple-expansion engine teaches him no more than a compound; a four-cylinder petrol motor little, if anything, more than a single-cylinder gas-engine. In fact, the smaller and simpler machines are better for his purpose, because they are more easily handled, and he can be left more to himself. The author remembers seeing in a technical school an engine of several hundred horse-power, which was being tested by some 15 or 20 students. They were taking readings according to a set scheme, one reading a thermometer, another a pressure-gauge, and so on, and all the readings were being entered on a beautiful printed sheet. On the same day he happened to speak to a schoolmaster, who described how he was in the habit of setting his boys two or three at a time to indicate the laundry engine at his school, and test its steam consumption with an improvised condenser. There cannot be much doubt that the schoolboys learnt more than the students, and that the money paid for that large engine would have been better spent on 20 small engines.

But, though small, the machines in the engineering laboratory should be real commercial machines, such as are bought and sold in the ordinary course of business, and the students should use them under ordinary working conditions. This is, of course, quite consistent with the use of the most elaborate measuring arrangements that the ingenuity of the professor or demonstrators can devise, provided that they are such as a commercial user of the machine would tolerate. Extreme variation of conditions is necessary for the purpose of research; but the ordinary student is not doing research, nor is it his object to learn in detail about the working of a special machine. His use for the engineering laboratory is to learn generally how to extract from an experiment conducted under severe limitations all the information that it is capable of affording. In doing so he will consolidate the knowledge of natural laws, which he is supposed to have acquired previously in an ordinary physical laboratory, and will learn their limitations; he will also pick up many facts about the working of machines which may or may not be of direct use to him, according as he meets with these particular types in after life or not. But these are by-products, and in the author's view the engineering laboratory should be designed and organised with a single eye to the primary educational use which has been indicated.

DISCUSSION.

Mr. R. S. BALL (London), in opening the discussion on these Papers, agreed with Prof. Hopkinson that the laboratory equipment should not be too elaborate. Good experience was obtained from partially erected engines. Laboratory equipment might be multiplied, but should be kept simple. The laboratory had been as great an aid to engineering as the ocean in the Irishman's opinion was to navigation.

Mr. D. CLERK, F.R.S., thought students ought to have control over any machines they tested, and for this reason small engines were more suitable than large ones. He, as a manufacturer, appreciated the work that had been done on gas engines both from the teaching and research points of view in engineering laboratories.

The CHAIRMAN (Dr. W. C. Unwin, F.R.S.) thought no positive rules on the question of laboratory equipment could be laid down. Apparatus could not be standardised. Some must be large and some small. It was valuable for students to make tests on a large scale owing to the feeling of reality that it gave.

(To be concluded.)

TESTS ON CERTAIN ELECTRICAL INSULATORS AT HIGH TEMPERATURES.*

BY W. W. STIFLER.

This work was undertaken in an attempt to find a substance which could be used to insulate a small coil at temperatures above 1,000°C. The insulators tested were mica, asbestos board, sodium silicate, a paste of magnesium oxide and alcohol, and a patent compound sold under the name of "cæmentium" or "liquid porcelain." The general method was as follows: The test sample was placed in a horizontal platinum resistance furnace and heated to 1,100°C. At convenient temperature intervals its resistance was measured, the temperatures being read by means of a platinum resistance thermometer and Whipple indicator.

The test samples were made as follows: Two nickel wires of sufficient length to reach to the centre of the furnace were joined at one end by means of the insulator to be tested.

No attempt was made to prepare samples of uniform size, and the readings taken were meaningless except as showing the behaviour of the particular samples. Hence all the results were reduced to percentages.

The condition of the samples after heating is worthy of notice. The asbestos had lost its fibrous structure to a great extent, and was quite crumbly. The mica was somewhat deformed, had become opaque, and was quite brittle. It could easily be crumbled between the fingers. The cæmentium and sodium silicate were baked hard, much like porcelain. The magnesium oxide seemed unaltered.

The results are shown graphically in curves in the Paper. While the data are too meagre to permit of any very general conclusions, we may draw a few inferences.

1. The insulating power of asbestos breaks down sharply at about 900°C. On cooling, it rapidly recovers its insulating properties.

2. Mica seems to remain an insulator up to about 1,000°C. It then breaks down very rapidly with increase of temperature. On cooling, the insulating power is recovered quite slowly down to 700°C., but below this temperature it recovers rapidly. On heating again, it follows the curve of recovery.

3. Magnesium oxide is an excellent insulator up to 800°C. When heated above this temperature, it becomes quite conducting, but recovers its insulating power on cooling.

4. Sodium silicate breaks down rapidly above 200°C. or 250°C.

5. The behaviour of cæmentium is quite irregular. Apparently heating to 1,000°C. improves its insulating properties to some extent, though it cannot be relied upon much above 500°C.

The results in the cases of sodium silicate and cæmentium were to be expected from the fact that glass and porcelain conduct electrolytically at high temperatures.

Telephones at Los Angeles.—The "Electrical World" mentions that in a recent address in Los Angeles, Mr. K. B. Miller, who was retained as an expert by the Board of Public Utilities, in fixing telephone rates, said that Los Angeles, with its two telephone companies, had over 80,000 telephones, or one to every four inhabitants. There were 750,000 daily calls, or two for every man, woman and child in the city. It is claimed that Los Angeles is better "telephoned" than any city of its size in the United States.

The Rates for Subscription to "THE ELECTRICIAN" are as under:—

	Year.	Half-Year.	Quarter.	
United Kingdom	26s. 0d.	13s. 6d.	7s. 0d.	Post free, payable in advance.
Canada	28s. 3d.	14s. 6d.	7s. 6d.	
Postal Union ...	30s. 0d.	16s. 0d.	8s. 0d.	

New volumes of "THE ELECTRICIAN" *commence in April and October.*

(This charge includes all the numerous Supplements.)

Vols. I to LXVI. can now be supplied. Price on application.

"THE ELECTRICIAN" SERIES OF STANDARD ELECTRICAL BOOKS

can be obtained of all Booksellers at Home, in the Colonies, and Abroad.

"THE ELECTRICIAN" ELECTRICAL TRADES' DIRECTORY AND HANDBOOK. Published annually in February, corrected to mid-February. Established 1882. A very valuable advertising medium, covering the entire Industry. SUBSCRIPTION Price (which is received *in advance* up to Jan. 31st in each year for the next following edition) 8s 6d. nett, postage 9d. extra. Published price 15s. nett, postage 9d. extra. Postage to British Colonies, 2s; Europe, 2s; U.S.A., 3s. 6d.; other countries, 2s. 6d. *Digest of Contents of the 1911 Edition sent free on application.*

THE PRACTICAL WIRELESS SLIDE RULE. By Dr. H. R. Belcher-Hickman. Price 2s. 6d. nett.

LIVINGSTONE'S DIAGRAM FOR THE EASY CALCULATION OF SHAFT AND BEAM DEFLECTIONS. By R. Livingstone. 2s. 6d. nett. By post in tube, 2s. 10d.

"THE ELECTRICIAN" PRIMERS (81 Primers in all, and a GLOSSARY). Single Primers 3d. each post free. *New and Enlarged Edition in One Complete Vol. or Three Separate Vols.* FULL PROSPECTUS FREE.

ELECTRIC TRACTION ON RAILWAYS. By Philip Dawson. Price 25s. nett. *Prospectus free.*

ALTERNATING-CURRENT MOTORS. By Dr. Rudolf Goldschmidt. Price 6s. 6d.

THE SHOT-FIRER'S GUIDE: A Practical Manual on Blasting and the Prevention of Blasting Accidents in Mines, Quarries, &c. By W. Maurice. Price 3s. 6d. nett.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. Wilkinson, M.I.E.E. *New Edition.* Now ready. Price 15s. nett.

ELECTRIC BLASTING APPARATUS AND EXPLOSIVES: With Special Reference to Colliery Practice. By W. Maurice. Price 8s. 6d. nett.

THE ELECTRIC FURNACE IN IRON AND STEEL PRODUCTION. By John B. C. Kershaw, F.I.C. Price 3s. 6d. nett.

BRAKES FOR TRAMWAY CARS. By H. M. Sayers. Price 3s. 6d. nett.

THE MECHANICAL DESIGN AND CONSTRUCTION OF COMMUTATORS. By R. Livingstone. Price 6s. nett.

THE ALTERNATE-CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Prof. J. A. Fleming, M.A., D.Sc., F.R.S. [abroad 13s.

VOL. I.—Price 12s. 6d. post free, abroad 13s. VOL. II.—Price 12s. 6d. post free, abroad 13s.

HANDBOOK OF THE ELECTRICAL LABORATORY AND TESTING ROOM. Very fully illustrated. By Dr. J. A Fleming. Vol. I., 12s. 6d. nett, Vol. II., 14s. nett.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. Fleming. 6s. nett.

ELECTRICAL LABORATORY NOTES AND FORMS. Arranged by Dr. J. A. Fleming, M.A., F.R.S. Single copies 4d. nett, or in dozens at 3s. 6d. nett. Complete Sets of 50 Notes and Forms, 12s. 6d. nett, or in strong portfolio, 14s. nett; or bound in strong cloth, 15s. nett. Spare Copies of Tabular Sheets, 1s. per dozen. Portfolios, 1s. 6d. each. Sectional paper, 1s. per dozen sheets. *Complete Prospectus post free on request.*

ELECTRICITY METERS: THEIR CONSTRUCTION AND MANAGEMENT. By C. H. W. Gerhardi. Profusely illustrated. Price 9s. nett.

ELECTRICITY IN HORTICULTURE. By Prof. S. Lemstrom. Illustrated. 3s. 6d nett.

RADIO-ACTIVITY: AN ELEMENTARY TREATISE, FROM THE STANDPOINT OF THE DISINTEGRATION THEORY. By Fredk. Soddy, M.A. Fully illustrated. Price 6s. 6d. nett.

ELECTROMAGNETIC THEORY. By Oliver Heaviside. Vol. I. Price 12s. 6d. Vol. II. Price 12s. 6d. *Vol. III. in the press.*

MOTIVE POWER AND GEARING FOR ELECTRICAL MACHINERY. By E. Tremlett Carter, C.E., M.I.E.E. Revised by G. Thomas-Davies, A.M.I.E.E., F.C.S. Price 12s. 6d. nett.

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. Ewing, B.Sc., F.R.S., F.R.S.E. Price 10s. 6d.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. Kennelly and H. D. Wilkinson, M.I.E.E. Price 6s. 6d.

ELECTRIC MOTIVE POWER. By Albion T. Snell. Price 10s. 6d. nett.

A POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. Geipel and H. M. Kilgour. Price 7s. 6d. nett.

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. Elton Young. Price 10s. 6d.

STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By H. K. C. Fisher and J. C. H. Darby. Price 7s. 6d. nett.

SIGNALLING ACROSS SPACE WITHOUT WIRES: THE WORK OF HERTZ AND HIS SUCCESSORS. With new Chapter on Tuning. By Dr. Sir Oliver J. Lodge. Price 5s. nett.

THE ART OF ELECTROLYTIC SEPARATION OF METALS. By Dr. G. Gore, LL.D., F.R.S.

ELECTRO-CHEMISTRY. By Dr. George Gore. Price 2s. [Price 10s. 6d.

BEGINNER'S MANUAL OF SUBMARINE CABLE TESTING AND WORKING. By G. M. Balnes. Price 7s. 6d. nett.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By Francis Jehl. Price 10s. 6d.

"THE ELECTRICIAN" WIREMAN'S POCKET BOOK. Price 5s. nett.

"THE ELECTRICIAN" HANDY WIRE TABLES FOR THE POCKET. By P. B. Down, Wh.Ex., A.M.I.Mech.E. Price 2s. 6d. nett.

THE RATING OF ELECTRIC LIGHTING, ELECTRIC TRAMWAY, AND SIMILAR UNDERTAKINGS. By W. G. Bond, M.I.E.E. Price 2s. 6d. nett.

DRUM ARMATURE WINDING AND COMMUTATORS. By F. M. Weymouth. 7s. 6d.

PRIMARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By W. R. Cooper. Price 10s. 6d. nett.

SECONDARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By E. J. Wade. [Price 10s. 6d. nett.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. Price 1s. 6d.

THE LOCALISATION OF FAULTS IN ELECTRIC LIGHT CABLES. By F. C. Raphael. 7s. 6d.

THE STEAM-ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. Beaumont, M.I.C.E., M.I.M.E., &c. Price 6s. nett.

THE ELECTRIC ARC. By Mrs. Ayrton. M.I.E.E. Price 12s. 6d.

TRAMWAY TRACTIVE EFFORT AND POWER DIAGRAM. By Arnold G. Hansard, B.A., A.M.I.E.E. Price 4s. 6d. nett; in Tube, 5s.

THE BRITISH POST OFFICE TELEPHONE SERVICE. Fully illustrated. Price 3s. 6d. nett.

INTERNATIONAL TELEGRAPH CONVENTION AND SERVICE REGULATIONS. Price 6s. nett. (LISBON REVISION, 1908.)

BOILER FEED WATER. By F. W. Anderson. Price 6s. nett.

(PRELIMINARY) WIRELESS TELEGRAPH CONFERENCE (BERLIN, 1903), PROCEEDINGS AT. Price 8s. 6d. nett.

INTERNATIONAL WIRELESS TELEGRAPH CONVENTION AND SERVICE REGULATIONS (BERLIN, 1906). With complete report of Proceedings. Price 21s. nett.

THE TWO-TONE VIBRATING TRANSMITTER AND CABLE INDUCTIVE SIGNALLING. By Edward Raymond-Barker. Price 1s. nett and post free. [Price 3s. nett.

THE CLASSIFICATION OF ALTERNATE-CURRENT MOTORS. By V. A. A. Fynn, M.I.E.E.

ELECTRIC CRANES: THEIR DESIGN, CONSTRUCTION AND APPLICATION. By H. H. Broughton. Being Vol. I. of a Complete Manual of Lifting and Hauling Machinery. *Ready shortly*, price 25s. nett.

MANUAL OF THE TELEPHONE. By W. Aitken, M.I.E.E. *Nearly ready.*

"THE ELECTRICIAN" INDUSTRIAL SUPPLEMENT.

With "THE ELECTRICIAN" for Sept. 14, 1906, was issued the first of a series of "Industrial Supplements," to be published from time to time with "THE ELECTRICIAN." The fifty-third issue of the Supplement published (Gratis) with the number of "THE ELECTRICIAN" for September 23, 1910, was the last of the monthly issues. "THE COMMERCIAL AND INDUSTRIAL SUPPLEMENT" to "THE ELECTRICIAN" is now issued weekly (Gratis). It will be found towards the end of the present issue.

NOW READY.

Vol. LXVI. of "THE ELECTRICIAN." Bound in Publisher's covers. Price 17s. 6d. Postage U.K. 1s. extra, abroad 2s. 6d.

Cases for binding Vol. LXVI. are now ready, price 2s.: post free, 2s. 3d.

THE PRESENT POSITION OF ELECTRIC TRAMWAYS.

It has been only too evident during the last few years that electric tramways in this country have ceased to mak any satisfactory headway. Indeed, so incapable of growt does the industry appear to have become under presen conditions, that an outsider might well think the require ments of the country had been met as regards locomotion This, however, is by no means the case, as may be judge by the eagerness with which rail-less traction has bee welcomed as a possible solution of the present problem Whether this new means will facilitate progress remain for the moment to be proved. There is no doubt that co siderable interest has been aroused by the experiment installations at Leeds and Bradford, and the experience these towns with the new system will be of much more th local value.

At the Congress of the Tramways and Light Railwa Association at Edinburgh last week, Mr. G. H. J. Hooc WINKEL discussed some of the reasons why electric tracti in England remains stationary. Confining himself main to one aspect of the problem, *viz.*, the comparatively hi cost of construction compared with that in other countri the author attributed this primarily to the heavy doub deck cars that have here found favour, necessitating expensive track; and he discussed the various objectio that have been raised against the adoption of light, sing deck cars, with trailers if necessary at times of peak lo The main objection—the greater number and length vehicles required—is not considered by the author to

Digitized by Google

serious in most cases, and he mentions that although the traffic per mile of route is greater in Berlin, Dresden and Lyons than in London, Dublin and Manchester, single-deck cars are used except on some of the trunk lines in these Continental cities. It must not be forgotten, however, that it is customary for the cars to travel at a higher speed than is permissible, or always possible, in this country, so that the greater number of vehicles is more easily dealt with. An important difference, moreover, is that passengers are allowed to ride on the platforms of the cars. We do not agree with the author that the type of cars generally adopted in this country should be so used, unless provision were made for passengers to stand by curtailing the seating accommodation. In another Paper presented at the Congress last week, Mr. C. W. MALLINS urges the claims of the single-truck car as against the bogie-truck car, and draws attention to the longer wheel bases now possible. This certainly seems to be a more desirable type, and by reducing the weight should lessen the wear and tear of the track.

There are several other points of interest dealt with by Mr. HOOGHWINKEL, among which may be mentioned bow-collectors, flexible trucks, "pay-as-you-enter" cars, and trailers. It is a curious fact that Continental engineers have gone in strongly for the bow form of collector, whereas we in this country have favoured the trolley wheel. It must be admitted, from the point of view of ease of working, the bow collector has a distinct advantage. There is no chance of its leaving the overhead line at a critical moment, no overhead switch points are required, and the overhead construction need not be carried out with such care in regard to alignment. With such a rival it is difficult to see why the trolley wheel has been favoured so strongly in this country. This appears to be due to the idea that the wear and tear with the wheel is less than with the bow. Actually, however, such does not seem to be the case, provided, of course, that suitable collectors are used. With greased aluminium collectors the wear appears to be extremely small, and as the tension on the bow is less than that which is usually put on the boom carrying the trolley wheel, the pounding at the ears carrying the trolley wire is not so marked. This point is of some importance, because all the serious wear in the trolley wire takes place at the ears.

With regard to flexible trucks, there seems to be much common sense in the view that some form of radial or adjustable truck in the case of four-wheel trucks might be used with advantage, the wear and tear of the track being considerably reduced thereby. Possibly tramway managers have found these advantages more than compensated by disadvantages, for the fact remains that such trucks have not been seriously taken up, and consequently the rigid type of truck, which from the point of view of adapting itself to the curves in the track is essentially bad, continues to be used extensively.

Mr. HOOGHWINKEL lays some stress on "pay-as-you-enter" cars and upon trailers. It is a little doubtful if a very good case can be made out for the former; at least, they would probably have to be used very judiciously to deal with certain classes of rather light traffic. So long as the traffic were light, no great difficulty would result, but we can imagine that at times of heavy traffic there might be difficulties. Passengers would not care, particularly on a rainy day, to be kept waiting whilst some old lady fumbled about to find half-a-crown and was then uncertain about the exactness of the change. Some years ago a special type of car without a conductor was run between Vauxhall and Camberwell, and the driver had the duty of seeing that the passengers put their fares into a box, and he also had to supply change when required. We do not know whether the result was found to be satisfactory. Possibly some modified form of this kind might be adapted to present-day conditions, but we think it must be quite clear that only light traffic could be handled in this way.

With regard to trailers, there does not seem to be the same necessity for these with double-deck cars as with the more usual single-deck cars found on the Continent. By using trailers with single-deck cars a very much better distribution of weight is obtained on the track, and there is a flexibility which is very advantageous for meeting the fluctuating conditions of traffic. Of course, it is essential in such cases that means should be provided for efficient braking. This might introduce a difficulty on our own tramways, as air brakes are practically not used in this country, and such brakes are far the most easily adaptable to trailer conditions.

A curious feature of the cost of construction to which attention is drawn by Mr. MALLINS in the Paper to which we have referred is the large variation in the cost per mile of single track on different undertakings in this country. Thus, taking 12 typical undertakings, the cost per mile varied from £9·9 to £3·3 in the case of the track and from £2·8 to £0·6 for the overhead construction. The cost of maintenance of the track showed an even greater variation, viz., from £300 to £21 per annum per mile of single track. As no idea, however, is given of the age of the respective undertakings, too much stress should not be laid upon these figures; but, nevertheless, we think it has been shown by both these authors that there is good ground for looking into the whole question of tramway construction and tramway running with a view to the lessening of cost.

REVIEWS.

Cours Elémentaire d'Electricité Industrielle. By P. ROBERJOT (Paris, 1911: Dunot & Pinat.) Pp. xii. + 352. fr.4.50.

This elementary treatise has been written to cover the syllabus for the French Schools of Commerce and Industry as laid down by the Ministerial Decree of 1909.

The official syllabus is given in full and occupies five pages, and it is interesting to note how the decree specifies in great detail not only the matter that is to be treated but also the manner in which it is to be illustrated by particular experiments. On reading through it one can almost picture to oneself the teachers throughout France setting out on the same day at the same hour to perform the same experiment before their respective classes and the Government inspectors on their rounds carefully comparing the lectures given with the official syllabus.

Digitized by Google

A slight stretch of imagination enables us to look into the future and see the text of each lecture issued by the Government to the teacher, who will have nothing to do but to impart it to his class at the specified time.

Throughout this book the treatment is remarkable for its clearness and accuracy, and care has been taken to confine it to an exposition of essential principles only, so that the work may be said to be admirably adapted for the use of elementary students. The subject-matter includes the resistance of variously grouped conductors, primary and secondary cells, generators and motors for continuous-current and alternating-current, electric heating and lighting and a short chapter on telephony.

In order to be able to discuss important matters that depend on theorems that would involve somewhat difficult proofs the author does not hesitate in some instances to state without proof the theorems required. For instance, the calculation of magnetic circuits and the lifting power of electromagnets is introduced by a statement of the connection between ampere-turns, reluctance, flux and lifting power. The author is perhaps not quite consistent in carrying out this process, and we find that in the chapter concerning alternating-current theory, although he sets out by stating the relations that hold between the maximum, average and effective values of a sine function, he investigates the properties of alternating-current circuits at considerable length and one cannot help thinking that the investigations here carried out will present more difficulty than the ones which he has excluded in other parts would have done.

In conclusion we might point out that in Fig. 17 the current I_1 is shown flowing in the wrong direction, in Fig. 346 a ring is shown with a two-phase winding that would not produce any external field as the coils are connected so as to give rise to lines of force closing inside the ring instead of across its diameter, and lastly that there is an unfortunate misprint on page 329, line 18, where "synchronous" is written for "asynchronous."

A. J. M.

Steam Turbines. By R. Rankin Kennedy. (London: Whittaker & Co.) Pp. 104. 4s. 6d. net.

This volume is intended to give engineers and students an insight into the methods employed for calculating the leading dimensions of steam turbines.

The author's fundamental distinctions between types are somewhat confused. In the first paragraph reference is made to pure pressure turbines, but it is not clear what design this refers to, as the remarks on the first and second page endeavour to explain the Hero type as not being a pure pressure turbine, but on page 4 the author contradicts this statement and defines a pressure turbine as a reaction turbine. It would be better not to introduce the term pressure turbine at all. Then again, in stating that turbines are usually differentiated into action and reaction turbines, the author explains that the latter term refers to pure reaction turbines. It should be explained to the student that the term reaction is generally used in connection with the Parsons type, which is not a pure reaction turbine.

The first chapters deal with theoretical considerations of design, and contain some simple calculations. Then follow illustrations and descriptions of standard designs. The following explanation of the Rateau turbine is not very lucid (p. 48): "If we can imagine a number of De Laval turbines placed side by side with the wheels in parallel planes, and if we imagine a large number of nozzles extending from the exhaust side of one wheel through the casings to the steam side of the next wheel, we have in principle a Rateau turbine."

The author gives extracts from Papers by Mr. Gerald Stoney and by Mr. Speakman dealing with some condensing plant problems. The author states that it is less expensive to produce a jet effect mechanically, as in a Le Blanc condenser, than by means of a steam jet as used in a Parsons augmentor. No figures are produced to prove this statement, and to the best of our knowledge the question is quite open and has never been thoroughly investigated.

The astounding statement is made on the same page that jet ejector condensers cannot be employed as main condensers, "for the condensed steam which forms good feed water for the boilers is lost, being mixed with the condensing water." The following paragraph is quite unintelligible (p. 68):—"A recently-installed Parsons exhaust turbine of 250 kw., working with steam between 2 and 2¼ lb. absolute pressure, consumed only 34·4 lb. per kilowatt hour, giving an efficiency of 57 per cent. compared with the Rankine cycle." Steam consumption results are given for a Zoelly 6,000 kw. turbine, and 14·6 lb. per kilowatt hour are converted into 20 lb. per horse-power hour.

The volume is only a small one, but the above examples will suffice to show that its contents are neither precise nor accurate.

R. J. Kaula.

Eléktrische Beleuchtung. By Dr. Berthold Monasch. (Hanover, 1910: Dr. Max Janecke.) Pp. xvi. + 102.

In the author's preface to this work on "Electric Illumination" there occurs a sentence which well deserves the close attention of all interested in electric lighting. It runs:—"It should not be forgotten that it is quite useless to regard the *intensity* of a light source as the criterion of the *efficiency* of a lighting installation; the real determining factor is the *illumination* produced." This sentence is also reproduced to convey some idea of the mode of treatment of the subject by the author, whose book is an earnest and successful endeavour to set forth and examine critically the various features which have to be taken into account when considering a light source, whether inherent to the source itself or totally independent of it, in order to arrive at a correct estimate of the relative value of the different electrical sources of light for this or that purpose.

The first edition appeared in 1906 and comprised Part I. only. Owing to the remarkable developments which have taken place in electric lighting since that date the present edition has been enlarged by the addition of Part II., dealing with the improvements in arc lamps and metal filament lamps during the years 1906-1910. Part II. has also been amplified.

Part I. contains eight chapters. After a few introductory remarks on the production of electric light by incandescence and luminescence, the author deals with the subject of photometry in chapter I. The principles of photometry and photometric measurements are excellently explained, and descriptions of some of the best-known photometers are included, together with several useful curves and tables. Chapter II. is on arc lamps and comprises sections on the electric arc, electrodes, arc lamp types, series, shunt and differential arc lamps. Incandescent lamps are next fully considered in chapter III.—carbon filament, metal filament, metallic oxide lamps (the Nernst lamp), as well as the metallised carbon filament lamp. Chapter IV. gives the methods of running arc and incandescent lamps, and the installation and attendance are explained in chapter V. Chapter VI. is on light distribution. It contains sections on the colour of light sources, the distribution of light from arc lamps for direct and alternating currents illustrated by curves, the effect of globes, &c., with similar sections on incandescent lamps. It is both instructive and interesting. The efficiency of electric light sources is well discussed in chapter VI., the table on page 194 giving the mean spherical Hefner candle-power of various sources of light being of great interest. A short but very able chapter on illumination then concludes Part I.

Part II. gives a survey of the improvements during the years 1906-1910 in photometry, arc lamps, mercury vapour lamps, tantalum and tungsten filament lamps, and contains very valuable information relating to the physical properties, dependence of candle-power on voltage, light distribution and efficiency of these lamps. Each part is furnished with a separate index.

We can strongly recommend the book to all connected with electric illumination, but, of course, a very fair acquaintance with technical German is necessary for English readers.

Viertalig Electrotechnisch-Werktingkundig Woordenbock. By G. J. van de Weill. (Amsterdam: Scheltema & Holkema's Boekhandel.) Pp. vi. + 441.

This book is divided into four parts in the first three of which are given the Dutch equivalents for certain English, French and German electrical terms. In the last part the English, French

Digitized by Google

and German equivalents of the Dutch terms are given. The work seems to be, on the whole, well done, though, like other similar books, it suffers from the fact that not enough attention is given to idiomatic equivalents. On the other hand, plenty of phrases, *e.g.*, "to remove a fault," are translated in full, but the translation is absolutely literal.

ON SELENIUM.

BY G. L. ADDENBROOKE.

Summary.—An account is given of a number of researches on the physical properties of selenium, more particularly its specific resistance and specific inductive capacity.

The writer has headed this article "Selenium," but he finds that leading authorities have lately been calling this element "Selenion," thus classing it with boron and silicon, which he conceives as more correct on our present knowledge and therefore he will in the body of the article and for the future adopt this form of the word.

Most of the literature on Selenion deals with its very interesting property of altering its resistance with variations of the strength of a beam of light falling on it, which has found applications in various ways and would find many more if the effect was more under control and more constant in different specimens. So far it appears to have been used chiefly in the form in which it is procured from the chemist, but it seems probable that if the material were better understood and if its fundamental properties were clearly recognised, it might be possible to prepare it in slightly different forms in which its characteristic action would be more under control and would have a larger range and be more rapidly responsive.

Selenion has also other interesting attributes. It is one of the few elements which can be described as an insulator, and it is chiefly on this account that the writer's attention has been directed to it. He has not so far performed any experiments on it personally which are worthy of the name; but, having collected together what information he could from a number of scattered sources in order to find out what the known characteristics of the material were, he has come across so much discrepancy and so many interesting points that it may be worth while bringing the particulars together and drawing attention to them.

In the first place Selenion exists in two or more allotropic forms, the vitreous and crystalline, the first having a density of about 4·3 and the second of 4·8. On heating it turns first to a sort of stiff pastey mass, which can be spread or smeared with some difficulty in fairly thin films, and in which state it is most frequently used when its property of changing its resistance as light falls on it is to be employed. If it is heated more, and this is a little difficult to avoid unless precautions are employed, gritty crystals form in the material which make it difficult to spread in a thin even film of any size; and if it is heated further with the object of liquifying these, sublimation begins to take place and a purple-looking powdery deposit, consisting in air of the oxide, is formed on cold objects near to it. If air is excluded then the element itself is deposited. For fuller particulars the article in the "Encyclopedia Britannica" may be consulted.

After the discovery of the light action on Selenion by Willoughby Smith and his assistant, an investigation of its electrical properties was made by Prof. W. G. Adams and Mr. R. E. Day, the account of which was presented to the Royal Society in 1876, and a pretty full abstract of which will be found in that useful work—Gordon's "Electricity and Magnetism." Now, in Gordon's abstract the resistance of Selenion is put down as 60,000 ohms. per cubic centimetre. In Lupton's Tables this is given at the same figure, but qualified by the fact that the result is for crystallised Selenion at 100° C. Why the result is given for this temperature I do not know, since the resistance would certainly be much higher at ordinary temperatures if Selenion follows the ordinary properties of dielectrics.

Now the writer recently purchased some Selenion (stated to be pure) from a leading firm of chemists, and which he gathered came from Germany. Since there is not much Selenion used it seems probable that this firm prepare most of what comes on the market and that this may be taken as a fair average specimen of that which is usually employed. It was in the form of sticks having a good many bubbles in them. Having charged an electroscope, a stick was held against the plate when the leaves at once fell. A pint Leyden jar was then connected to the electroscope and the two charged together. This is a method the writer often finds convenient for rough insulation tests of materials. The jar has a capacity of about 1/750 of a microfarad. On touching the plate of the electroscope with the Selenion rod again the leaves at once fell, though not quite so quickly as before; from this test the writer gathered that the resistance of his specimen was somewhat of the same order as the Selenion employed by Adams and Day, and that this represents the characteristics of that usually made use of at the present day. That such figures have, however, very little to do with the real resistance of Selenion the following will make clear.

In return for a long Paper on the electrical properties of pure sulphur the Royal Society gave a grant to Prof. Threlfall for the purpose of enabling him to attempt a similar investigation on Selenion. In his Papers "On the Conversion of Energy in Dielectrics," in the American "Physical Review" for 1897, he gives some particulars of his experiments. Having cast an ellipsoid or small bar of Selenion he held this to a charged gold leaf electroscope and found that the leaves fell perceptibly in 30 seconds. The bar the writer used above would have a much larger section, but having regard to the conditions, in the two cases, it would appear as if the resistance of Threlfall's specimen was much higher than that obtained by the writer. This is not unlikely, as Threlfall ordered 100 lb. at one time, and the manufacturers having such an order and knowing it was intended for investigation purposes may have taken unusual pains to secure a purer product. Threlfall succeeded in purifying further some of this Selenion which he found to contain as he received it about half a per cent. of impurities, chiefly copper and glass (*see* his Paper in the Royal Society's "Proceedings," 1907.) He does not appear to have been able to carry on his electrical investigations further, but this has been done by some of his successors at the University of Sydney. These are embodied in a Paper by Messrs. Mason and Vonwiller (Royal Society "Proceedings," 1907, or 10 years later.)

These observers prepared a thin flat plate of vitreous Selenion which they say was free from holes, and was part of Threfall's specially purified product. They state that they had difficulties in getting the resistance at first owing to a thin film of oxide which they found greatly lowered it, and in connection with which the writer's remarks above may be noted. On carefully taking off this film with glass paper they found themselves unable to get sufficient deflection on a sensitive galvanometer with a battery of 900 volts to enable an estimate of the resistance to be made, they having first covered the opposite faces of the plate with gold leaf to secure good contact. They were therefore obliged to fall back on an electrometer; with this they determined the resistance to be at 20°C. $2{\cdot}2\times3\ 10^{16}$ ohms per cubic centimetre and $6{\cdot}5\times10^{15}$ ohms at 25°C. This makes the resistance of pure Selenion about half that of the generally accepted resistance of paraffin, our best insulator. If this result can be accepted, and the writer thinks it can from other internal evidence in the Paper, pure Selenion is an insulator of very high character. With such a high resistance it is pretty obvious that the special sensitiveness to light of Selenion must be greatly reduced, but it was still found to exist sensibly. From this evidence it seems safe to conclude that the sensitiveness of Selenion to light must be due more to impurities contained in, or in combination with the Selenion than to the pure element itself.

Let us turn now from the resistance of Selenion to its capacity, or dielectric coefficient. Threlfall, in the Paper abvoe referred to, states that he tested a sample by the ordinary method with a galvanometer and condenser and got a coeffi-

Digitized by Google

cient of about 30, which he thinks should only be treated as provisional, and it is clear that this method is not applicable with commercial Selenion. Threlfall does not seem to have been aware of Boltzmann's earlier results obtained by his beautiful method of comparing the attraction of two balls of the dielectric, two to secure equal weights and size, one coated with gold leaf to act as a pure conductor, and the other of the natural dielectric alone. This, which the writer thinks the most pertinent and suggestive method he knows, seems never to be described in text-books, although it is fully noted in Gordon, for whom also Boltzmann wrote a special memorandum showing the mathematical steps by which he was able to arrive at the capacity from the relative attractions. Now Boltzmann, or rather his pupils, Romich and Nowak, made two determinations of the capacity of Selenion, not long after Willoughby Smith's discovery, in apparently the same series of experiments, in which the former discovered the rapid apparent increase in capacity of dielectrics with time when continuous currents are used for the determination, a point which was very prettily further demonstrated by Dr. Thornton in a Physical Society Paper last year, and which Paper has also not attracted the attention which the writer thinks it deserves. These two determinations of Boltzman of the electrical capacity of Selenion were each made in two ways, first with a rather rapidly varying current and next with a continuous current, or rather pressure, in each case. The first of these determinations makes $K=10{\cdot}2$, the second $K=8{\cdot}4$; and in the second case the rise in apparent capacity with a continuous pressure is much less than in the first case, from which in the writer's experience he would unhesitatingly have chosen the second as likely to be the more accurate. Nevertheless, 10·2 is the capacity for Selenion, which has been quoted in the text-books for 30 years and is taken as the accepted capacity for long waves in an important Paper which will be referred to below.

The above two results, as far as I can make out, remained unchallenged until 1903, when Pirani, in an Inaugural Dissertation at Berlin, which is referred to by Messrs. Mason and Vonwiller, made a new determination for commercial Selenion, getting a result of about 7·58 or rather less. Unfortunately I cannot find this Paper from the reference, and although there is the name of Pirani in "Science Abstracts" about the right date, the extract referred to seems missing in the body of the book, and I am therefore unable to give the method by which it was obtained. Lastly, Messrs. Mason and Vonwiller took up the subject in the Royal Society Paper already quoted from, and with some of the Selenion specially purified by Threlfall and which he had left at Sydney when returning to England.

Working with an alternating current of 50 periods, they made the capacity of vitreous Selenion about 6·14, and they refer to a previous determination by some Melbourne physicists, in which with the same purified Selenion a capacity of 5·78 was obtained, which they think too small. They also tested this Selenion with a very high frequency current and got practically the same result as at 50 periods, a point which made the writer doubt the accuracy of the result for some months after he found Messrs. Mason and Vonwiller's Paper, as he did not at first reading grasp the very high insulation obtained with this purified Selenion, and which, as pointed out above, approaches that of paraffin. Under these circumstances similar readings might be obtained for the capacity at two very widely different periods. There is, however, another piece of evidence in favour of Messrs. Vonwiller and Mason's figure from quite a different source, which is one of the chief reasons which has led the writer to pen this article, and which seems to have escaped attention by these experimenters, or they would certainly have quoted it. The writer thinks this point has much theoretical interest besides possibly practical importance later.

On February 28, 1902, Prof. R. W. Wood, of Wisconsin, who at present happens to be in London and was lecturing recently at the Royal Institution, read before the Physical Society a most delightful Paper on the optical properties of Selenion. In this he shows that there is a very strong absorption band in the visible spectrum, so that the refractive index rises to 3·14, the highest known, and falls off both ways. It seems clear that the action of light on Selenion is due to the presence of this absorption band. I need hardly refer to the relation of the square of the refractive index to the dielectric capacity which formed the basis of Maxwell's theory. Taking a value of the refractive index in a part of the spectrum free from absorption, at the end of his Paper Wood proceeds by the latest optical formula to calculate its equivalent for long waves such as are used in ordinary electrical work. His result brings the capacity of Selenion to 6·05, a result almost identical with that obtained by Mason and Vonwiller. Wood goes on to quote the received value of the capacity of Selenion as 10·2, and there leaves the matter. Five years later, and in ignorance apparently of Wood's prediction, almost the identical value is arrived at by Messrs. Mason and Vonwiller.

The writer would like to draw the attention of electricians specially to this. We electricians are apt almost to take it for granted that scientific advances will come from the electrical side, but a perusal of some of the work in the optical field the last few years will show how much leading workers in this field have, so to speak, trespassed into the electrical field, and the writer would not be at all surprised if some of the next great advances in the development of electrical theory came from that direction.

Looking back on the facts above, it is fairly clear that the Selenion used by Wood must have been of the commercial character, and that if he had used some of the pure product, while he might have got similar effects, it is probable that they would have been greatly reduced in intensity, perhaps more of the character of the similar effects as regards change of resistance to light which have been recently found in paraffin oil by a French observer. It would be very interesting if the effect could be further investigated. Such an investigation would probably clearly establish the fact that the peculiar behaviour of Selenion to light is due to the presence of a small amount of impurity, whether in combination or mechanically diffused through it. In this case it seems hardly possible that nature has already mixed just the right amount of the very best substance required to produce this effect in the most intense form, and it would certainly seem as if careful research might possibly result in producing a material with considerably enhanced powers which might find many applications of commercial as well as of a scientific importance. Anyway, the whole of the evidence the writer has collected seemed so interesting and suggestive that he thought it was worth putting together and embodying in a single article.

CORRESPONDENCE.

PATENT PROCEDURE.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: Your editorial note on "Patent Procedure" raises some very interesting points, but I hardly think the suggestion made by you will cure the defect which arises from the delay in hearing appeals from the Comptroller to the Law Officer. Your suggested remedy will certainly not, in my opinion, benefit what you refer to as the "poor working man" inventor. I think the best remedy for the delay will be the appointment of more Law Officers. The appeals to the Law Officers have a great advantage in that the procedure is very economical and a special day and time are appointed for hearing the case. A Patent Agent may (and very often does) attend on behalf of his client before the Law Officer, the employment of Counsel being a matter of discretion and expense. When the Law Officer gives his decisions, the costs given against the losing party are quite nominal, and it has been a feature of patent practice that both parties pay the best part of their own costs, with the result that the costs to both have been very nominal in comparison with cases in the High Court.

If, as you suggest, the appeals from the Comptroller were taken before a judge of the High Court the expense would be greatly increased, for it would be necessary to employ a Patent Counsel in every case, as the Patent Agent who conducted the

Digitized by Google

case whilst in the Patent Office could not appear before a judge of the High Court. The appeal would be entered in the list in the ordinary way, and the applicant might have to wait about in uncertainty for days, expecting the case to come on at any minute. In appeals to the Law Officer a time is appointed, greatly to the convenience of the parties and adding greatly to the reduction of cost.

Whilst on this subject, I might raise another point, of far greater importance. Why should not procedure in relation to patents be divorced from the High Court altogether, and questions of infringement be heard in a special Patent Office Court consisting of a Board of Judges with technical knowledge, or better still, have two Boards, a Board of first instance and a Board of Appeal? If any alteration in the procedure is to be made to benefit the inventor, it must be by way of maintenance or increase in the efficiency of the Court which gives the decisions on technical subjects, and a method of procedure by which the burden of enormous costs will not be possible.

Incidentally you state that a patent is not so readily saleable now as it was before the passing of the Act. I think you are wrong. If the patent is good, it bears on the face of it evidence of its novelty, and to this extent is more saleable; but if the patent is thin in novelty it also bears the fact on the face of it and is not so readily saleable. The fact really is this: the success of a patent is not always dependent on the quality; it is dependent on the man behind it, and whether the invention meets a real want or not. If the owner of the patent is blessed with commercial ability, money is often made, even though the patent, from a legal point of view is very thin.

I understand that the Law Officer is now giving special time to the appeals from the Comptroller with a view to working off the arrears.—I am, &c.,

Chancery Lane, W.C., July 18. H. Allen Pryor.

[The object of our notes was to draw attention to the delay in hearing appeals from decisions of the Comptroller-General and to suggest a remedy. The cost of an appeal to a judge in chambers should not be greater than the expense involved in the present procedure, and patentees could be represented by patent agents and solicitors, or by counsel, as the circumstances required. However, the suggestion made by us was only put forward tentatively. We consider it a good one, but any alternative, such as the appointment by the Board of Trade of a lawyer with good experience in patent law and procedure and technical training, would be equally acceptable to us.

Our correspondent raises another interesting, but somewhat difficult, point as to the procedure in actions for infringement. We admit that the present system has many disadvantages, as many of the judges do not possess the necessary technical knowledge, but the difficulty would be to find men with the necessary legal and technical training and experience to constitute the suggested Boards. We may say, however, that any proposal for improving and cheapening patent procedure will have our support.—Ed. *E.*]

OERLIKON PORTABLE INSULATION CUTTER FOR COMMUTATORS.

In order to obtain a really good contact between the brushes and commutator of a direct-current machine it is essential that the insulation between the individual commutator segments, whether it be mica or any other material, should not protrude above the circumference defined by the commutator metal. In fact, it is preferable that the insulation material be slightly recessed.

It very often happens that in time the insulation gradually protrudes, either due to the fact that the copper is worn down quicker than the insulation material—which is particularly likely to occur if the latter is hard mica—or due to dampness or expansion differences between the commutator metal and the insulation material.

In such cases it is necessary to scrape out the insulation material between the individual commutator segments. This is done, as a rule, by means of an ordinary scraper, a three-edged file, saw, or such like tool. The result is usually a badly scratched commutator and unevenly scraped out insulation, resulting in the necessity of grinding up the commutator afresh.

This recessing of the insulation is done very much better and more quickly by means of the transportable cutter built by the Oerlikon Co. (Fig. 1). The apparatus consists of a bronze bow, B, provided with two handles. In the recess of the bow a small cutter or mill is

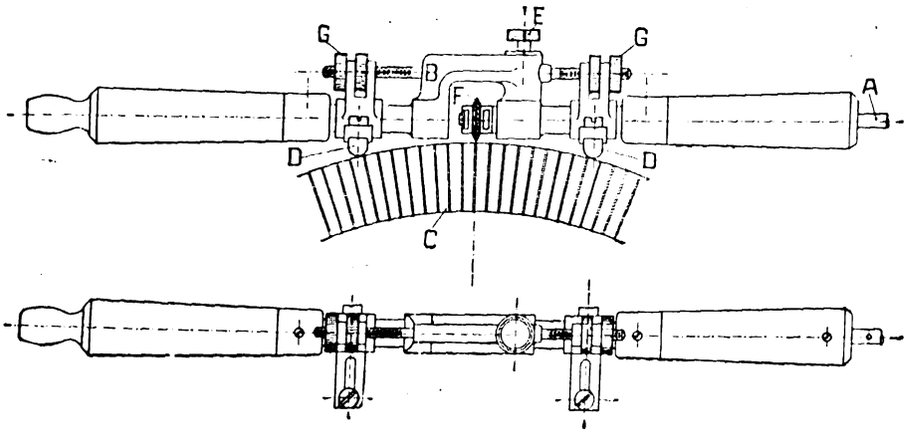

Fig. 1.—Portable Cutter for Commutators.

arranged, fitted on to a small shaft, A, passing through the right-hand handle of the bow. The whole apparatus rests on the commutator at the supports D, the distance between which is adjusted by the screws G. This device permits the accurate adjustment of the cutter or mill to the requisite depth, so that the milling out of the insulation material between the commutator segments is carried out to the same extent all round the commutator.

In order that the apparatus may be used for commutators of different diameters, the supports D are made exchangeable, supports of different height being supplied with the apparatus. The height necessary depends on the diameter of the commutator, and is tabulated below. The apparatus can also be used quite easily for very much larger commutators.

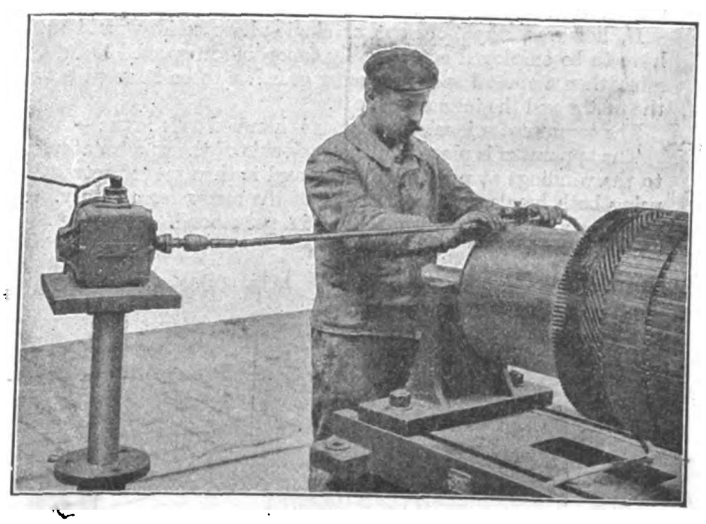

Fig. 2.—Portable Insulation Cutter in Operation.

Each apparatus is provided with five different pairs of supports. The following table shows the correct size of supports to use for different sizes of commutators:—

(*a*) With cutter of 20 mm. diameter. (*b*) With cutter of 25 mm. diameter.

Diameter of commutator in millimetres. (Approx.)	Guide supports. Dimensions in millimetres. (Approx.)	Diameter of commutator in millimetres. (Approx.)	Guide supports. Dimensions in millimetres. (Approx.)
60— 170	⌊⌋ 9×26	80— 200	⌊⌋ 9×26
171— 300	⌋⌊ 9×26	201— 450	⌋⌊ 9×26
301— 500	7	451— 700	7
501— 700	5	701—1,400	5
701—1,200	4	1,401—3,000	4

The cutter, or mill proper, is run at a speed of 500-700 revs. per min., and is driven by means of a $\frac{1}{8}$ H.P. motor through a telescopic shafting, adjusted between 500 mm. and 800 mm., this shafting being fitted at each end with a universal link.

If the apparatus is used extensively, it may be found desirable to draw off the dust and waste insulation. This can be done by connecting the handle on the left side of the apparatus to a vacuum cleaner, condenser air pump or such-like apparatus, as this handle is made hollow, and permits the drawing off of the dust direct from the mill. The lubricating medium for the shaft A is pressed into the bearings of the latter by tightening up the screw E. Either a direct-current, single, two or three-phase motor may be used.

As the speed of a standard hand-drill motor for two or three-phase

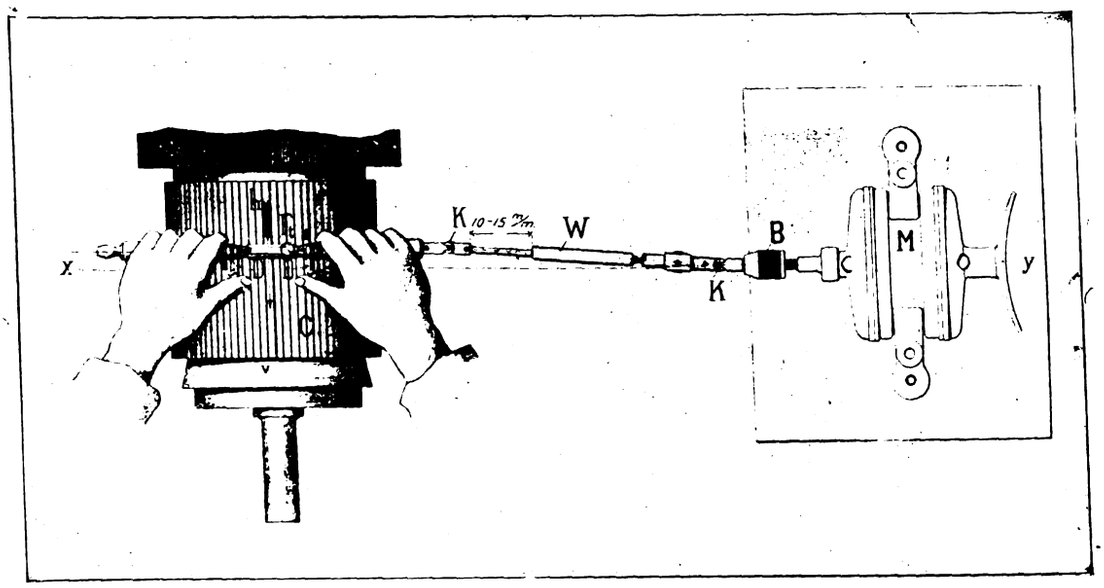

FIG. 3.—PORTABLE INSULATION CUTTER FOR COMMUTATORS WITH DIRECT-CONNECTED MOTOR.

current lies between 500 and 700 revs. per min., it is possible to couple up the telescopic shaft of the insulation cutter simply by inserting the pin of the universal link into the self-centring cone of the drill motor, as shown in Fig. 3.

If, however, direct-current or single-phase series-wound motors have to be employed considerably exceeding in speed 700 revs. per min., then a special speed-reducing gear has to be inserted between the motor and the telescopic shaft.

The commutator insulation cutter is handled as follows :—

The apparatus is placed on the back side of the commutator, next to the windings at point *h* (Fig. 3), and is then moved forward, by using both hands, in the direction of the arrow from *h* to v. The motion should be limited to about $\frac{1}{2}$ in. per second.

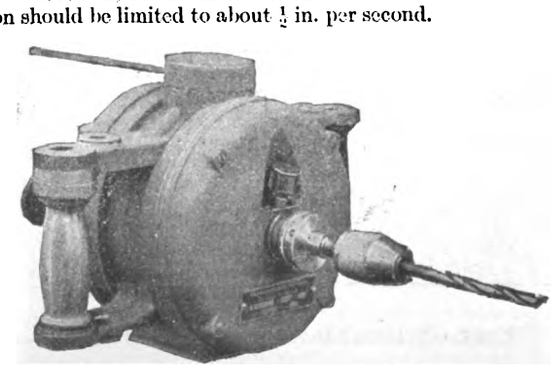

FIG. 4.—STANDARD DRILL MOTOR.

In order to guide the apparatus accurately and to ensure steady cutting, experience shows that it is advisable to place the thumbs on the one side on to the two supports D, whilst also pressing them slightly on to the commutator surface.

The whole operation is particularly easily carried out if the workman stands immediately in front of the commutator, as indicated in Fig. 2. If the insulation cutter is not constantly in use for the purpose for which it is designed, the motor can conveniently be employed as a portable drill, as shown in Fig. 4. A standard may also be supplied if required, so that the drill may be used as a stationary unit. The weight of the complete apparatus, inclusive of telescopic shaft, but exclusive of motor, is approximately 3·3 lb.

PARLIAMENTARY INTELLIGENCE.

TELEPHONE TRANSFER BILL.

In the House of Commons on Friday, on the order for the second reading of this bill,

Mr. S. ROBERTS expressed satisfaction at the fact that an arrangement had been come to between the National Telephone Co. and the Postmaster-General on the points which were raised in the bill. He then withdrew his motion to refer the bill to a Select Committee.

Mr. JOYNSON-HICKS said he had seen a deputation of the staff two nights ago, and they informed him that they had been met by the Postmaster-General and the Assistant Postmaster-General with great kindness, and that they had every reason to hope and believe that their claims would be met with justice. He understood the Postmaster General did not give his decision on some outstanding points, but tha he had given the staff the assurance that he would shortly put befor them a Memorandum. There was one point with regard to the senio staff he wished to mention. There were 12 members of the National sta in receipt of salaries of upwards of £700 a year. Those gentlemen, wh had really made the Telephone Company, and had been in its service fo many years, were not at present to be taken over by the Postmaste General. Speaking from the point of view of the public interest, I could not see how the Government could really take over that vast unde taking unless they came to some arrangement with at least a fair propo tion of those 12 senior members. As far as he could gather, the Pos master-General was not averse from taking some of them into his servic but there seemed to be a difference of opinion on the question of salar Those gentlemen were in receipt of larger salaries than those which t heads of the Post Office were receiving, but he suggested that no questio of dignity on either side should be allowed to stand in the way of a sat factory arrangement in the public interest.

Mr. WATT said Glasgow Corporation wished to be assured that by t passage of the bill nothing was being done or would be done to prejudi the existing rights of local authorities to apply to him for a licence carry on, under the terms of the Telegraphs Act, 1899, a telephone unde taking in their respective areas.

Mr. H. SAMUEL stated, in reply, that they had been able to arrive at understanding with the representatives of the National Company wi respect to two or three points that were outstanding. He thought the outstanding points were really the result of misunderstanding rath than of disagreement. The company appeared to have formed t opinion that he was anxious to vary the terms of the agreement enter into with the company in 1905 by the Postmaster-General of that d to the company's disadvantage, and to bring in the Legislature to al that agreement. Any such thought was very distant from his min After a personal discussion with the representatives of the company, th had been able to arrange that the wording of the bill should be alter in order that there should be no room for doubt that the bill did ta with the agreement, and that certain matters, such as the right of acc to the plant for inspection, should be arranged by a mutual interchan of undertakings rather than by a clause in the bill. Those points wo settled in a quarter of an hour, and the House would not be troubl with them.

With respect to the staff, it was, of course, his desire to do full justi to the members of the staff and to secure that their status should properly safeguarded, and the new employés of the Post Office would treated on the same terms as the old employés doing the same kind work. In many respects the position of the company's employés wou be greatly benefited by the transfer, for about 10,000 of them would h the first time have pensionable rights, which was no small advantag

Digitized by Google

Several points of detail had been under discussion between the Staff Transfer Association, which was very representative of the company's staff, and himself, and he had been in communication with the Treasury with respect to several of them. Many of them had been already settled, one or two were still not quite completed. He would be able to establish a considerable proportion of those classes of the staff whose position was previously unsettled, and with regard to the rest an equitable allowance would be made to safeguard them against loss. In regard to the question of the 12 senior officers of the company receiving salaries of over £700 a year, the company was unwilling to part with five, as they would need their services in the preparation and prosecution of their case before the Board of Arbitration. Some of the others had nearly attained the age of 60, which was the ordinary age of retirement of Civil servants, and it would not be considered desirable to take into the employment of the State men who had very nearly reached the age of retirement. With respect to the others, they certainly hoped to be able to bring some into the Post Office, and they would be very glad indeed to have the advantage of their large experience and their capacity. The final arrangements, however, were not yet completed. There was nothing in the bill which would prejudice the position of municipalities to undertake telephone systems if they so desired in the future. The Act of 1899, which empowered municipalities to conduct a telephone business if they desired to do so remained, and it was not affected by the new measure. His own inclinations and opinions, as he had made quite clear to the House, were opposed to the municipalisation of telephones, and he thought expert opinion throughout the country was opposed to municipal telephones. As a matter of fact, he had received no request from any local authority to embody any system of municipal telephones in the bill, nor had the Association of Municipal Corporations approached him. Nor had Glasgow Corporation passed a resolution on the subject, although some individuals in Glasgow who were interested in the matter desired that nothing should be done to prejudice municipal ownership in the future.

Lord H. CAVENDISH-BENTINCK said that the Corporation of Nottingham had asked him to find out their position with regard to wayleaves, for which substantial sums had been paid in the past. It was assumed that the Postmaster-General would have the privilege of them without payment, and he hoped the Corporation would obtain their instalments at a lower rate.

In reply, Mr. H. SAMUEL said he was afraid he was unable to give the desired assurance. The Postmaster-General did not pay for wayleaves to local authorities either for telegraphs or the existing telephone service, and it would create a great inequality if with regard to the new system he paid certain towns for wayleaves. The telephone service was a public service for the benefit of the community at large, and to pay the local authorities would be to give the ratepayers a certain advantage, while the subscribers to the telephone service would have to find the money. With regard to granting telephones at a lower rate to certain people who granted wayleaves, that would give rise to great difficulties. If local authorities received that concession, private individuals who granted wayleaves would require their telephones at a cheaper rate, and if they failed to get them might threaten to terminate the agreement.

Capt. NORTON stated, in reply to Mr. Burdett-Coutts, that it had already been decided that the sum to be paid should be referred to the arbitrators.

The bill was then read a second time.

EDUCATION ESTIMATES.

On Thursday last week the House of Commons went into Committee of Supply on the Education Vote, when Mr. RUNCIMAN made a lengthy statement as to the policy of the Board of Education. After a reference to the work of the Imperial Education Conference, which was held in the spring of this year, to the International Conference on Mathematics, and to the Conference of the Universities of the Empire which will be held next year, Mr. Runciman announced that he had arrived at an agreement with the British Museum Trustees which would give them the land required for the Science Museum, and which would not interfere with the development of the Natural History Museum. He regretted to say that from all he had learnt of the work done in the provinces and of the work done on the Continent he had to confess that it was in the field of higher technology that they had most leeway to make up. It was true that in many directions large sums of money were being devoted to the endowment of technological chairs in almost every modern university. Great progress had been made during the past year. The University of Liverpool had recently founded a Professorship of Naval Architecture, largely owing to the generosity of Mr. Elder. They had also created a department for the study of the problems of town planning—a new and interesting department. There were at the present time at least two departments in modern universities for the study of aeronautics. A professorship has been founded at Leeds for the study of the gas, coal and fuel industries. In the same university instruction was being provided in woolcombing and spinning, for which the Clothworkers' Company had given £50,000, making, he believed, the school at Leeds one of the most valuable technological schools in Europe. In the North of England £35,000 had been provided for the teaching of mechanical engineering, and in three universities sums of £30,000, £50,000 and £70,000 respectively had been provided for the promotion of chemical science. In London £60,000 had been set apart by the University Association for the training of women in the study of the science of the household. Great progress had been made in the departments of metallurgy and chemistry in the North. In the sciences at the Imperial College great improvements had been made in the last 12 months, and he believed now that the leaders of the great industries were well alive to the fact that in the development of higher technological work lay much of the hope for their future commercial success. In the 11 modern Universities of England at present there were 9,600 full-time students, with 7,000 at Oxford and Cambridge of under and post graduates, a total of 16,600 students. In Germany there were 63,000 students in similar institutions.

In regard to university grants the most important departure made in the administrative work of modern universities was to be found in the change in distribution of the Treasury grant. The Government had decided to transfer the distribution of this annual grant to the Board of Education, and now the only Government department modern universities had to deal with was the Board of Education. That met with the approval of modern universities, and in the many conferences he had had with their representatives they had shown the desire to do their best to work with them for the common end. He could not pretend to say that the Board of Education was at present sufficiently equipped to do the whole of the work undertaken by the advisory committee appointed by the Treasury. He had, therefore, set up a small advisory committee to deal with the distribution of these grants. He had secured the service of Sir William McCormick as chairman, and associated with him were Sir J. A. Ewing, C.B., F.R.S., Sir Wm. Osler, M.D., F.R.S., Miss Emily Penrose, Sir Walter Raleigh, Sir John Rhys and Sir Arthur Rücker.

The secondary education work of the Board had shown a remarkable growth during the last few years. At present there came under the purview of the Board 1,060 secondary schools and all but 90 of these received grants from the State. The amount asked for had risen from £647,000 three years ago to £770,000 for 1911-12. That amount covered 161,000 scholars, of whom just over half were boys. One fault he had still to find with secondary schools all over the country was that the children came in too late and went out too early.

In the course of the discussion, Sir PHILIP MAGNUS said he gathered that Mr. Runciman was not altogether satisfied with the higher technological work which was being done in this country, but the only fact mentioned to illustrate the cause of that dissatisfaction was that the number of students in German technological institutions was much greater than in this country. No doubt that was so; but it should be borne in mind that the higher technical institutions of Germany had been established almost as many decades as institutions of a similar character in this country had been established years. One of the reasons why higher education in this country did not compare favourably with that in Germany was that the grants provided were much smaller here than in Germany. He looked with confidence to the Board of Education to give higher grants to the new universities in this country. He appealed to the Board to take such steps as might be necessary to ensure that when grants were made to secondary schools these grants should not be given exclusively to the pupils, but that some part should go to increasing the income of the schools so that more efficient and better qualified teachers could be appointed.

Sir WM. ANSON referred to the statement by Mr. Runciman that we were behind Germany in the higher technology, but the obvious reason for that was that our older universities were remote from the centres of industry, and he looked for a remedy in the new universities, notably those of Leeds and Sheffield, which would come into closer relations with the industries in their neighbourhoods.

TELEPHONE CALLS.

In the House of Commons last week the Postmaster-General was asked whether the registration of calls on the telephone exchanges was absolutely automatic, or whether such calls were recorded by the operators; and what guarantees subscribers had as to the correctness of the number of calls registered.

In reply, Mr. H. SAMUEL said that in the large Post Office exchanges, where the calls were registered by means of meters connected with the subscribers' lines on central battery switchboards, no call could be registered on any line unless it were connected with another line. The registration was not entirely automatic, as it did not take place unless the operator depressed a key which controlled the meter. The objection to an entirely automatic register was that it would not distinguish between calls which resulted in effective conversations and those which were non-effective, and should, therefore, not be charged for. Meters of the same form as those in use by the Post Office were in general use in all the large exchanges in the United States, and the results were considered satisfactory. He was obtaining samples of a device which would register all calls automatically, but would allow the cancellation of ineffective calls, the subscriber being informed of the cancellation at the same time, and if that apparatus proved satisfactory it might be possible to allow subscribers the option of having it fixed on their lines at the small extra cost involved by its use. He had seen a statement in a newspaper article that operators, when reported to the supervisor, were in the habit of taking revenge by charging fictitious calls, but he had not heard it from any other source, and had no reason to believe that there was any truth in it. He would make inquiries.

COAL MINES BILL.

On Tuesday Standing Committee B of the House of Commons, presided over by Mr. Eugene Wason, passed, with certain amendments, clauses 58 and 59 of this bill. The following provision, moved by the Solicitor-General for Scotland, was inserted in clause 58: "No internal combustion engine shall be introduced underground in any coal mine after the passing of this Act."

An amendment to clause 58, moved by Sir A. Markham, to limit the hours of colliery enginemen (with certain exceptions) to a maximum of eight hours out of 24, was carried by 18 votes to 12.

Digitized by Google

Clause 60 (1) in the bill reads: "Electricity shall not be used in any part of a mine where* on account of the risk of explosion of gas or coal dust the use of electricity would be dangerous to life, and if the owner of a mine, on being required by an inspector of the division not to use or to desist from using electricity in the mine or any part thereof on such ground as aforesaid, refuses to do so, the question as to the application of this section to the mine or part thereof shall be settled in manner provided by this Act for settling disputes." Mr. Stephen Walsh proposed to add after the word "where" (at the place marked *) "safety lamps are in use and where." Mr. Walsh said the use of electricity should be prohibited in places where there was danger of inflammable gas.

The SOLICITOR-GENERAL FOR SCOTLAND said the hon. member's amendment would absolutely prohibit the use of electricity in any mine where safety lamps were required. He did not think he appreciated the fact that that might necessitate the taking out of a great number of installations which had been put in the mines with the approval of the Home Office, and the expenditure entailed by taking them out might lead to the ruin of a considerable number of enterprises without accomplishing any good purpose. Clause 32 provided that if there had been one ignition causing any personal injury within 12 months that would necessitate the use of safety lamps. The use of electricity was dealt with best by departmental regulations, and would be dealt with by very specific regulations.

Mr. T. RICHARDS said he and his friends were sincere in pressing the amendment because of the real alarm that had been felt in regard to the use of electricity in mines. It had been proved over and over again that the best experts could not account for the vagaries of electricity. Until they knew more about electricity and could control it better than they could at present the Home Office should be very jealous in sanctioning its extended use. There had been brought to his notice evidence that electrical coal cutting machines and conveyors gave off sparks when high-tension currents were used. They would have to ask the Home Office to tighten up its regulations.

Mr. HARVEY said it had been proved that electricity had caused explosions, and much electrical machinery had had to be removed from mines because of the sparking that had taken place. It was inconsistent to put electrical apparatus into mines where safety lamps were used.

On Wednesday Mr. WADSWORTH said the workmen were justified in their fears of working by electricity in fiery mines. The inspector of the Yorkshire district had said in 1909 that electrical engineers were not always good mechanics, and did not seem to have realised the danger of introducing electricity in fiery mines. On the surface the electrical plant was not subject to the rough usage that occurred underground. The Departmental Committee came to the same conclusion as he (Mr. Wadsworth) when they said the main directions in which the requirements needed to be strengthened were by prohibiting the use of electricity where, on account of the risk of explosion, such use would be dangerous.

Mr. LAURENCE HARDY said if the amendment were passed either the safety lamps or the electricity would have to come out, and it might be the lamps. It was in consequence of the reports of the inspectors in 1908 and 1909 that the Departmental Committee was appointed in 1909, which reported early this year. They said experience had shown that the use of electricity could not be regarded as mechanically unsafe, and that it possessed some characteristics of great value in underground conditions. The regulations had been made much stronger by the Committee, they had guarded as much as possible against the dangers, and the regulations now in force had the backing of the chief inspector, Mr. Redmayne. He had an extract from an expert's opinion stating that the danger from safety lamps was greater than that from electricity. The amendment would abolish the use of electricity in mines.

Sir ARTHUR MARKHAM said the amendment was impracticable, and if it were passed Parliament would be bound to reverse the Committee's decision. There were mines in which safety lamps were used although the gas did not exceed ½ per cent., and there would be cases where either safety lamps or the electricity would have to be taken out, and in the majority of such cases the safety lamps would be taken out. There was water in many pits, and pumps worked electrically were used with perfect safety, as there was no gas or dust, yet under this amendment every pumping plant would have to be closed down, or practically all of them. He did not know how one could work in a deep pit bottom without electricity. If the amendment were accepted half the electrical plants in mines in the country would be taken out. He only knew of one case where electricity had ignited dust, and that was not in a pit bottom, but in a coal bunker. There was no more danger in using electricity at the bottom of the downcast pit than there would be in using it in that room.

Mr. JOHN WILSON did not agree that there could not be explosions without gas. Such explosions had occurred at Altofts, Wingate and Westhoughton. The Westhoughton explosion was caused purely by electricity. He would refer Sir A. Markham to the West Stanley case.

Mr. EDGAR JONES thought the use of electricity for coal cutting should be absolutely forbidden, without any reservation. With regard to its use for haulage, in the last few years, especially during the boom, when tremendous profits were made, the colliery owners in South Wales put in new electrical machinery. It became a fever, and huge power stations were built. The colliery that first of all installed heavy electrical machinery underground were at present clearing it out as fast as they could. The manager told him it was going to be a tremendous loss to his company. He gave him examples of flashes of flame, feet in length, having occurred, and said he could hardly sleep at night for the fear of what might happen before he had cleared the electricity out. He was told the other colliery companies in South Wales had also to drop electric haulage machinery. The question of coal dust would not be tested by using the safety lamp, so he thought they might rule that out. He thought the inspector would say there was risk in every colliery in South Wales at the present time, and the inspector should have the right to forbid the use of electricity. That would obviate the necessity of passing a new Act if the development of the next few years made the use of electricity safer. He thought it would be better to say "You shall not use electricity unless you have the definite consent of the inspector."

Mr. BRACE said there could be no doubt that electricity could be, and was, the first cause of explosions where gas was absent altogether. At West Stanley it was found that coal dust between the terminals was the cause of an explosion. That was close to the bottom of the shaft. Neither colliers nor colliery owners preferred to work with safety lamps, and there must be good reason before they used them. So it might be assumed that a mine in which they were used must be a dangerous mine in the opinion of the collier, the colliery owner and the inspector, and that was the reason for putting forward the amendment under discussion. If the Committee thought it safe to light the pit bottom electrically, they could add to the clause "save at the pit bottom."

The SOLICITOR-GENERAL FOR SCOTLAND said the clause carried out the recommendations of the Departmental Committee, who recommended alterations in the regulations, and they were going to have new regulations. According to the expert opinion of gentlemen who reported, there had been no accident due to the use of electricity that was not a preventable accident, and the prevention might be accomplished by altering the regulations and the conditions under which electricity was used. He thought the proposed amendment would curtail the area of prohibition.

Mr. LEIF-JONES said the amendment would not increase the safety. He preferred the clause without the amendment.

Mr. S. WALSH thought the Committee had misjudged the application of the amendment. It read: "Where safety lamps are in use, *and where*." That meant that in any part of a mine, even where safety lamps were used, if, in the opinion of the inspector, of the district, there was no attendant danger of explosion from gas or coal dust, he thought even then electricity could be used. There had already been most effective regulations for the control of electricity, but what had happened? There was no doubt the Home Office experts had worked their best under the best regulations they could devise, but there had been enormous loss of life in the last few years. Four of the greatest disasters of modern times had happened, not because of the regulations, but in spite of them. Therefore he thought when colliery owners apprehended danger and put in safety lamps, electricity should not be used.

It was agreed to alter the word "and" in the proposed amendment to "or."

Mr. WM. HARVEY said if there were another catastrophe like West Stanley "electricity would have to be taken out of the mines," because the men would not have it.

Sir ARTHUR MARKHAM said he and others used safety lamps where there was no gas, simply to prevent timber being fired. He had never known any case where electricity had ignited coal dust, unless it was associated with disturbance. It had never been suggested by any expert or proved to be otherwise. Mr. Wilson had been speaking of shot firing. That had nothing to do with the question they were considering. At West Stanley the evidence showed that the explosion occurred simultaneously with the engine stopping. It was caused by a cloud of dust being set up and associated with the electricity.

The amendment was rejected by 26 votes to 13.

Sir ARTHUR MARKHAM had put down three proposed additions to clause 60, but announced that he had decided only to move the one set out below and to leave the others (which dealt with technical matters) to be dealt with in regulations.

Clause 60, page 31, line 17, at end, insert: "If in any place of a mine, or part of a ventilating district of a mine, the amount of inflammable gas in the air current exceeds ½ per cent. or upwards, the use of electricity shall at once be discontinued in such place or part of such ventilating district where the inflammable gas exists till the air current is clear of the same, or shall not exceed ½ per cent. A hydrogen or other type of safety lamp approved by the Secretary of State, in which low percentages of gas can be readily observed, shall be provided and used for testing for inflammable gas at least twice during every working shift by a competent person appointed by the agent or manager at the place or places where electricity is used, and a daily record, signed by the aforesaid competent person or persons, shall be kept at the mine of all such tests and the occasions on which, in accordance with this rule, it has been found necessary to discontinue the use of any electrical plant."

In moving the above amendment Sir A. MARKHAM said where there was electricity there was always a liability to open sparking, and he asked the Committee to set the standard of ½ per cent. of gas. There were many places where gas was present and where electricity was being used.

The SOLICITOR-GENERAL FOR SCOTLAND said the desire for a precise standard was commendable, but there were considerations which weighed against the acceptance of the amendment as presented. In the preceding clause there was a classification of mines, and they might probably find by the classification of mines a means of arriving at an exact standard, but the effect of the amendment as proposed would probably mean prohibition, not only where safety lamps were concerned, but also where naked lights were concerned. The Home Office were advised that the presence of ½ per cent. of inflammable gas in the air current was not necessarily dangerous. The amendment would be almost impossible to enforce, because those working at the face would not have means readily available for detecting ½ per cent. of gas, and if it were detected all use of electricity would have to cease. It was not desirable to have an act in that stiff and precise form unless it was certain that it could

Digitized by Google

be enforced without unnecessarily inconveniencing the management and those working at the face.

Mr. EDGAR JONES thought the amendment might limit the power of the inspector to have electrical plant removed. At present a man might refuse to go on working a coal-cutting machine if it was sparking, but if the machine were tested, say, twice a day, the man might be more careless, and the conditions might be less safe than heretofore. No decent colliery manager would work electricity where there was ½ per cent. of gas.

Sir ARTHUR MARKHAM then withdrew the latter part of the above amendment, retaining only the first portion, ending "½ per cent." in the sixth line.

The amendment thus altered was carried by 15 votes to 12.

Mr. ADAMSON moved in clause 60, page 31, line 17, at end, to insert: "Pending the result of the arbitration proceedings, electricity shall not be used in a mine or part thereof respecting which objection has been taken to the use of electricity by the inspector of the division."

The SOLICITOR-GENERAL FOR SCOTLAND said the general rule with regard to arbitration was that the status quo remained until the decision of some competent authority had been given.

Mr. BRACE and Mr. C. EDWARDS thought the use of electricity should be discontinued pending the arbitration, as explosions might occur in the interim.

Ultimately Mr. Adamson withdrew his amendment in favour of the following, which the Solicitor-General for Scotland agreed to insert: "When any question under this section has to be referred to arbitration, the owner shall, pending the settlement of the question, comply with the requirements of the inspector, subject to an appeal to the chief inspector."

Clause 60 as amended was then passed.

TRAMCAR TRAILERS IN LONDON.

In the House of Commons on Monday Sir A. Griffith-Boscawen asked the President of the Board of Trade whether London County Council, in April, 1909, asked the Board of Trade for permission to run coupled tramcars, to enable it to cope with the heavy tramway traffic on the tramways during the busiest hours of the morning and evening; that the Board agreed, in Jan., 1910, to the experimental use of single-deck cars on the Euston to Hampstead tramway route, subject to their not being run between 10 a.m. and 5 p.m.; that the Board, in July, 1911, further restricted its consent by limiting the running of the cars to the hours between 7 and 9 in the morning and after 7 in the evening; that the Board had declined to allow double-deck cars to be used as coupled cars on any suitable routes or to permit smoking in one of the single-deck coupled cars; whether he was aware that coupled or trailer cars were extensively used on tramways in Europe and America; and whether the President was now prepared to grant fuller facilities to the Council to carry out this system, in order that the congestion of traffic might be relieved, and workpeople might be able to get more expeditiously to and from their work.

In reply, Mr. S. BUXTON said the facts were mainly as stated. In the special circumstances of London traffic, it appeared to the Board of Trade that, before the question of any general permission to use coupled tramcars could be considered, some experience of their use should be obtained, and an experimental service was permitted, after consultation with the Chief Commissioner of Police, and restricted to hours fixed upon representations made by him. The police, as responsible for the control of the traffic, were necessarily concerned in the matter. The Board were advised that double-decked cars should not be permitted to be coupled together, in view of the great weight of those vehicles, and they had suggested to London County Council that the question of allowing smoking in one of the coupled single-deck cars might be deferred until it was settled whether a general consent could be given to the running of coupled cars. Some further experience was desirable before the matter could be finally decided.

Corporation of London (Bridges) Bill.—On Tuesday this bill was read the third time in the House of Commons.

LEGAL INTELLIGENCE.

Thermal Synd. Ltd. v. Silicaware Ltd.

On Monday Mr. Justice Swinfen Eady commenced the hearing of an action for an injunction to restrain an alleged infringement of letters patent for an improved electrochemical plant for working silica.

Mr. Walter, K.C., with Mr. A. B. Shaw, appeared for plaintiffs; and Mr. Bousfield, K.C., and Mr. Colefax were for the defence.

Defendants denied infringement and pleaded prior knowledge.

Mr. WALTER, in opening, said the letters patent, dated 1904, related to improvements in the manufacture of silica. Silica was a body very difficult to fuse. Mixed or combined with potash of soda or lead it had been known for years in the form of silicates, as in ordinary glass. The fusing point of glass was 800 deg. One of the great difficulties in the working of silica was that the difference between the melting point and the solidifying point. The material was worked at an enormous heat—viz., 1,800 deg.—and the workmen had to be enveloped in asbestos. Owing to the small difference between the melting and solidifying temperatures it was impossible to work silica by the same process as that used in glass manufacture. Silica had to be worked immediately, because it solidified 16 times more rapidly than glass. When it was in a soft condition it skinned over almost immediately. The patentees of plaintiffs' device were Mr. J. F. Bottomley and Mr. Arthur Paget, now Sir Arthur Paget. After many experiments they discovered a method of working silica commercially as follows: They mounted a carbon rod between two electrodes of an electric furnace. This was surrounded by sand. By working to a temperature rising to 1,800°C. a melting action took place, which eventually formed a cigar-shaped piece of silica round the carbon resistance of the furnace. It was here that the gases which were thrown off by the process were used in a curious manner. As they were thrown out from the carbon core they formed an envelope between the core and the silica, enabling the former to be withdrawn. No one hitherto had believed that this material, except in the furnace flame could be dealt with, because the heat disappeared rapidly and a skin formed immediately. The patentees, however, discovered that when sufficient force had been used to break this outer skin there remained underneath a plastic mass which could be easily worked like glass. That was what the plaintiffs' patents embodied, and counsel produced great vessels which as the result of the discovery had been blown in silica, and were specially suitable for the storage of strong acids; also silica tubes, beakers, morters and pestles, &c. The current used in the process was roughly 1,000 amperes at 15 volts for half an hour. The result of the discovery had been to reduce the price of silica from £20 to 1s. a pound. Defendants were a company who were manufacturing similar articles in silica abroad, and were selling them on the English market. From enquiries they had made, plaintiffs had come to the conclusion that defendants were infringing their process

Mr. DUGALD CLIRK said he had examined plaintiffs' plant, and had studied the past history of silica working. He was convinced that there was nothing in earlier specifications similar to plaintiffs', which was undoubtedly a useful invention.

The hearing was adjourned.

Aktiengesellschaft Mix & Genest v. H. Oppenheimer.

This case came before Mr. Justice Eve on Friday on a motion by plaintiffs, asking the Court to substitute their nominee for the receiver appointed by the Master in chambers.

Mr. DANCKWERTS, K.C., said plaintiff company, who are manufacturers of electrical goods at Berlin, and defendant entered into an agreement in September, 1905, under which a certain electrical business that was being carried on in London under the title of the International Electric Co. was declared to be the property of plaintiffs. Defendant was to act as manager and plaintiffs were to furnish all the materials with which the business was to be carried on. It was also agreed that all disputes should be settled according to German law in the German Courts. There was also a provision that if the profits in any two years did not exceed 20,000 marks the agreement should be determined. At the beginning of the present year the agreement was determined, but the *status quo* was kept up for a short time by arrangement. In February last plaintiffs commenced an action in order to get possession of the premises in London and the assets, and they also claimed an injunction to restrain defendant from preventing plaintiffs from entering upon the premises. Defendant retaliated by moving that the action should be stayed pursuant to the agreement. Plaintiffs had no answer to that, and the only thing left for them to do was to protect the property in the interim. That point was recognised by counsel, and an order was agreed on Feb. 1 by which a receiver was to be appointed, and all further proceedings stayed, defendant undertaking to carry on the business with due diligence and to give plaintiffs access to the premises. Mr. Pixley was appointed receiver in pursuance of that order. Eventually an action was commenced in Germany by Mr. Oppenheimer, in course of which plaintiffs asked for an interim order in the Lower Court, which was refused, but granted on appeal. Mr. Danckwerts said what he wanted the Court to do was to make a parallel order here for the purpose of carrying out the German order. He could not have brought an independent action on that order of the German Court, and he only put it forward as an interlocutory order, and to say that such Court was the one to which the parties by agreement had said should settle their disputes. The findings of the German Court were that Mr. Oppenheimer did not deny that the assets of the firm in London belonged to plaintiffs and that defendant set up that the goodwill of the International Electric Co. belonged to him and not to plaintiffs. The International Co. dealt in the manufactures of plaintiffs, and could not get on without them. The Court further decided that plaintiffs were entitled to the assets of the London business, subject to certain conditions. Mr. Pixley asked for £150 per month for his remuneration, and that was a material fact to be taken into account. If plaintiffs' nominee was appointed receiver there would be no expense for remuneration.

Mr. Justice EVE: You seek to discharge Mr. Pixley and appoint someone else?

Mr. DANCKWERTS: Yes, one of our directors is over here, and could be appointed. We contend that plaintiffs carry on business in England as the International Electric Co.

Mr. Justice EVE: What position are the German proceedings in now?

Mr. DANCKWERTS: The action is proceeding on the point as to whether or no Mr. Oppenheimer is the owner of the goodwill.

Mr. LAWRENCE, K.C. (for Mr. Oppenheimer), pointed out that up to the present the proceedings in Germany were merely interlocutory, and that there were no pleadings, and also that the appointment of a receiver was left to the Master in chambers, and he appointed Mr. Pixley.

Mr. Justice EVE: What has happened to show that I ought to make a change? The only thing that weighs with me is that Mr. Danckwerts asks for a receiver who will act without salary.

Mr. LAWRENCE submitted that no ground had been shown for going behind the appointment of Mr. Pixley. He did not admit that the

Digitized by Google

capital of the International Electric Co. belonged to plaintiffs, as his client had a substantial interest in it.

In giving judgment Mr. Justice Eve said that the only thing that made him hesitate was his desire to pay proper respect to the Court of a friendly nation, and if he saw his way to make any order which would secure defendant as well as plaintiffs, adopting the decision of the German Court, he would have been relieved. But he must treat the matter strictly. Defendant had asserted his right to go to Berlin for the ascertainment of some position between him and the company, and in the course of the proceedings the German Court thought that plaintiffs should be put in possession of the assets of the London business subject to Mr. Oppenheimer's right to have security amounting to 150,000 marks deposited by plaintiffs to answer any possible damage that Mr. Oppenheimer might suffer. Plaintiffs were willing to do that, and also to treat themselves as managers of the business for whoever it might ultimately turn out to belong. He was impressed with the fact that the continuance of Mr. Pixley's receivership would involve a claim for remuneration, but on the whole he did not think the circumstances warranted him in acceding to the application which would, therefore, be dismissed, with costs.

Leave to appeal was granted.

Electricity Supply Works Assessment.

At the County of London Sessions last week the Westminster Electric Supply Corpn. appealed against the assessment of their undertaking by the Assessment Committee of the St. George's, Hanover-square, Strand and Westminster Unions, in the parishes of St. Margaret and St. John the Evangelist.

Mr. Clavell Salter, K.C., M.P., and Mr. A. B. Shaw appeared for appellants, and Mr. W. Ryde, K.C., and Mr. Konstam for respondents.

Appellants were assessed for their undertaking in the parishes of St. Margaret and St. John the Evangelist at £34,900 gross and £17,449 ratable. The Assessment Committee reduced the figures to £33,650 gross and £16,825 rateable, but the company appealed from the latter amount. Before the Assessment Committee the principal point at issue was whether the calculation of the annual value should be based upon the actual receipts and expenditure for 1909, or whether the hypothetical tenant would base his calculation on the probable receipts and expenditure for the ensuing five years. In 1905 appellants decided to make a large reduction in the price for electric current, and they prepared an estimate of the balances that would probably be shown by the revenue account during each of the ensuing five years. Owing to the effect of metal filament lamps on the consumption of electric current the expected increase did not take place. The estimated balance in Dec. 1905, was £75,000, actual balance £74,409; 1906, £80,000, actual £72,267; 1907, £85,000, actual £66,429; 1908, £90,000, actual £76,507; 1909, £95,000, actual £76,676. Following this experience appellants estimated that in the five years from 1910 to 1914 the balance on revenue account would be respectively £65,000, £56,000, £52,000, £54,000 and £57,000. As a matter of fact the balance in 1910 was only £60,330. Under these circumstances they estimated that there would be a diminution of their balances during the next five years, as the enormous increase in the use of metal filament lamps had made a serious difference in the sale of the units for lighting. The effects of the increased competition of the gas companies would compel them to further reduce prices, and the number of empty houses in the area of supply was still large and increasing: the chief houses were now supplied, and, therefore, the ratio of increase could not be the same as that before 1905. The receipts for 1909 were £4,400 below the estimate, and 1910 had shown the decrease was continuing. Appellants therefore asked that the amount in the parish of St. Margaret and St. John should be reduced from £33,650 gross and £16,825 ratable to £27,450 gross and £10,625 ratable. In regard to St. George's, Hanover-square, the grounds of objection were the same. The assessment in that case was first made at £65,150 gross and £32,574 ratable. On objection before the Assessment Committee the amount was reduced to £61,350 and £30,675 respectively. The company now asked that the amounts should be further reduced to £50,050 gross and £19,375 ratable.

Evidence was given by Mr. Humphrey Davies and Mr. H. H. Fuller.

For respondents it was stated that in 1905 the rating in the Hanover-square district was £73,980 gross and £36,990 ratable. Since then a new transformer house had been built, despite which the assessment had been reduced to £61,350 gross and £30,675 ratable, and they contended that in so reducing the assessment they had allowed sufficiently for any change that might have taken place in the value of the property and that the circumstances did not warrant such an estimate of decrease in profits as that anticipated by appellants.

After hearing evidence for respondents the appeals were dismissed, with costs.

Bartlett v. Boot.

At the Westminster County Court on Monday, before Judge Woodfall, Mr. Geo. Bartlett, solicitor, sued Mr. Horace Boot, consulting engineer, for £21 as a fee which he claimed was due to him for introducing defendant to members of the Chichester Council in connection with an electric lighting scheme.

Counsel for plaintiff said his client was a member of Chichester Council for some years. Early in 1900 the Council was contemplating an electricity scheme. Ultimately the Council became anxious to transfer their provisional order to a company, and plaintiff and defendant, who had known each other for some years, meeting at Tunbridge Wells, the latter suggested that plaintiff should introduce him to the chairman of the Electric Lighting Committee of the Council. Plaintiff accordingly introduced defendant to Councillor Aylmore, and negotiations led to the provisional order being transferred to a company. Much correspondence passed between plaintiff and defendant, and in one of his letters plaintiff wrote: "I shall be pleased to do all I can for you in the matter of introducing your company on the understanding of the usual *quid pro quo*." In a letter from defendant to plaintiff at a later date, the former said: "I need scarcely inform you that if you obtain the provisional order your position will be well looked after." When, however, plaintiff sent in a claim for 20 guineas for obtaining the introduction defendant denied that there had been any promise of a fee, but offered to transfer 20 £1 shares of the company to plaintiff. This offer was declined, and the present action brought.

Plaintiff gave evidence, and said he thought 20 guineas a moderate fee for obtaining the introduction. He had been told that 100 guineas was not an unusual fee to be paid under such circumstances.

For the defence Mr. Boot said there was never in his mind any question of a fee being paid to plaintiff when the early negotiations were entered into. Plaintiff told him that the transfer of the provisional order to a company would be of great benefit to the ratepayers, and would also benefit himself, and witness understood that he was anxious for the transfer to take place because he was one of the Council who had recommended the obtaining of the order. Witness also understood that plaintiff would be able to find money for the company and would have a seat on the board, which would have constituted a *quid pro quo*. He did not arrange to pay him a commission. He offered to give him shares because at the time he was worrying him, and being an old personal friend and related to a mutual friend, he thought it would be better to give him 20 shares and have done with it.

His Honour, in giving judgment, said the expression "the usual *quid pro quo*" might have meant money or it might have meant plaintiff being made a director or being appointed solicitor to the company, and the words in defendant's letter "if you obtain the provisional order your position will be well looked after" were equally ambiguous. There was no evidence to prove that there was an agreement to pay money, and under those circumstances there must be judgment for defendant, with costs.

Light Railways.—An inquiry was held at Birmingham on Friday into the application of the Corporation for a light railway order.

Mr. Hutchinson, K.C., said the matter arose out of an application of the Hales Owen Light Railway Co. for power to construct a railway under the Hales Owen Order of 1902. Birmingham Corporation opposed as half the proposed railway was within the city. Smethwick and Oldbury also opposed, and desired that the application of the Corporation should be acceded to. The Commissioners granted the application partially and the inquiry was adjourned. In May, 1910, there was a further hearing in London, and the result was that the Commissioners—on the undertaking of the Corporation to construct the railway and introduce certain provisions—came to the conclusion that the Corporation should make the railway. Certain technical difficulties arose, and in February last another application was made by the Hales Owen Co., and in the result the Commissioners acceded to the application of the Corporation on condition that they should submit to the Commissioners and the company, a clear statement of the nature of the undertaking they gave. Therefore, he presented to the Commissioners the order for the construction of a double line of railway upon a road intended, in the main, to be 80 ft. wide, between Balden-road and the termination of the authorised Hales Owen railway, and the termination of the tramway which belonged to the Birmingham & Midland Tramway Co.

After hearing evidence, the chairman (Col. G. F. O. Boughey) said the Commissioners were prepared to grant the order irrespective of any schemes which might be in the background, and with which they were not concerned.

Olympia Electrical Exhibition.—The management of this exhibition have made arrangements for an elaborate display of cooking demonstrations in the galleries at Olympia from Sept. 23 to Oct. 21, and manufacturers who are exhibiting have had space granted to them without rental charge, and a free supply of current provided they supply the demonstrations in question during the exhibition. It is considered that this arrangement will be of great public interest. We are informed that one of the large firms of house furnishers and electrical contractors have secured a large block of space in the galleries where they are erecting a model electrical home of elaborate description and worthy of a great international exhibition. There is also to be a garage, an electric laundry, electric kitchens, country house lighting and a series of living rooms equipped to show the advantages of electricity in the home.

Our Canadian Visitors.—England, and London especially, has been the rendezvous for many hundreds of Canadian visitors during the past two or three months, and surprise has been expressed by our visitors at the absence in our streets of electric telegraph poles and wires. It is notorious that in some parts of Canada and the United States it is difficult to "see the forest for the trees"—that is, it is difficult to see the houses on the footpaths for the numerous wires, posts, poles, &c., which disfigure the streets. The "Canadian News" of Toronto advises the local authorities of Canada to follow the example of the old country.

COMMERCIAL AND INDUSTRIAL SECTION.

MUNICIPAL, FOREIGN & GENERAL NOTES

BRITISH NOTES.

Acton.—The Metropolitan Electric Supply Co. (Acton District) Act, by which the Metropolitan Electric Supply Co. take over the municipal electricity undertaking at Acton, contains two interesting clauses to the effect that if the local authority wishes to purchase at the end of the term of 42 years, for which the company have obtained powers, they must give three years' notice of purchase instead of the usual six months. If such notice is not given the local authority cannot return to the subject. Moreover, during this period of three years, any capital required for the extension of the undertaking is to be supplied by the local authority.

Baildon.—The Council will oppose a proposed application of the Wharfedale Electric Light & Power Synd. for a provisional electric lighting order.

Birmingham.—The Corporation will consider on Tuesday next an important report of the Tramways Committee, recommending the purchase of the outstanding interests of the City of Birmingham Tramways Co. and the British Electric Traction Co., and also various extensions and improvements of the local tramway system.

In their report the Committee state that it is so obviously desirable that the whole of the tramways within the existing city, and the areas to be included within the city on Nov. 9 next, should be under the control and jurisdiction of the Council that they had been in negotiation with the City of Birmingham Tramways Co. with a view to the purchase of their interests and the interests of the British Electric Traction Co. As a result of these negotiations the committee are now in a position to state that the City of Birmingham Co. are willing to sell after Nov. 9 next, subject to confirmation by the Council of the enlarged city, the whole of their interests and those of the British Electric Traction Co., including the rolling stock (except 21 cars), lands, buildings, generating stations, appliances and apparatus, for £151,500. This amount includes payment due from the Corporation in respect of rolling stock, &c., in connection with the Bristol-road route, and payment from King's Norton Council in respect of the rolling stock, &c., in connection with the Pershore-road route. It is part of the arrangement that the stores at Yardley and Bournbrook depôts shall be taken over by the Corporation from the City of Birmingham Co. at a valuation. Provisional arrangements have also been made for working by the City of Birmingham Co. on behalf of the Corporation, as from June 30 last, of the tramways proposed to be acquired.

The Committee also recommend that powers be obtained for constructing 16 new tramway lines and for carrying out various improvements of the system.

Conway.—The Rural Council have consented to the supply of electricity by Colwyn Bay and Colwyn Council in a portion of the parish of Lydiate.

Customs Duties.—A special customs agreement between Germany and Japan came into force on Monday (July 17), and so far as the rates fixed by the Agreement represent reductions of the rates of the new Japanese General Tariff, and the existing German Tariff, such reduced duties will be applicable to British goods sent to Germany or Japan.

The following are some of the duties specified in the agreement for imports to Japan, the duties fixed by the new Japanese Tariff, and hitherto in force, being shown in parentheses :—

Gas, petroleum and hot air engines, between 5,000 and 50,000 kilogs, 4·50 yen per 100 kin = 7s. 9d. per cwt. (5 yen); between 50,000 and 100,000 kilogs 4 yen = 6s. 11d. per cwt. (5 yen); over 100,000 kilogs 3·50 yen = 6s. per cwt. (5 yen); dynamos with gas, petroleum or hot air engines between 10,000 and 50,000 kilogs 5·50 yen per 100 kin = 9s. 6d. per cwt. (5·80 yen), between 50,000 kilogs and 100,000 kilogs 5·20 yen = 9s. per cwt. (5·80 yen); over 100,000 kilogs 4·90 yen = 8s. 6d. per cwt. (5·80 yen).

Ealing.—The charge for electricity for power, heating and cooking has been reduced to 1d. per unit.

G.P.O. Flower Show.—The Central Telegraph Office Amateur Gardening Association, which now numbers nearly 400 members, held its annual flower show on the 18th inst. in one of the rooms of the old G.P.O.

There were 193 entries, divided into 29 classes, and all the competitors were members of the Association. The exhibits are declared to have reached in many cases a high standard of amateur gardening.

Hastings.—The Clive Vale and Tower Schools are to be wired by the Education Committee.

Ilford.—The Council have received sanction to a loan of £8,070 for mains, meters, switchboards, &c.

Inquests.—On Monday an inquest was held at Penge (London) on Richard Archer, a telegraph linesman, who was killed at the Crystal Palace low-level station on the 13th inst.

Evidence was given that deceased was engaged with another linesman named Stephenson in making an estimate for electric signalling. Deceased mounted an iron ladder of a signal with a steel measuring tape in his hand, witness holding the other end. Deceased had reached the platform of the signal when he received a severe shock from an overhead wire, which was conveying current at 6,000 volts, and he was thrown to the ground.

Dr. SCOTT TURNER said that death was due to a fracture of the base of the skull. His left hand was burned as though he had received an electric shock on the hand, and the steel tape which was used showed plainly at one end that it had touched the electric wire.

A verdict of accidental death was returned.

An inquest was held at Jarrow last week into the death of Robert Anderson, jointer, who was killed at the Jarrow sub-station of the County of Durham Electrical Power Distribution Co.

The father of deceased said that he was assisting him to uncover an oil switch. They had completed the work and deceased stepped upwards and upon an angle bar. Witness suddenly saw a flash from above where they had been working. He ran to the other end of the chamber, and when he returned he saw his son lying on the floor. Deceased had been working at the sub-station about seven years.

Mr. H. A. MYLES, senior assistant engineer at the power station, said when the oil tank was removed he examined the switch and told deceased to file the contacts.

In answer to Mr. W. Lauder, factory inspector, witness said he did not put in the protecting tray to protect the terminals as he did not think it was necessary. If the tray guard had been in position deceased could have climbed on to the top of the oil switch and would have been protected from the live terminals. He also admitted the regulations in regard to making dead conductors in the cell when work was being carried out had not been complied with.

Mr. JOHN MCLAREN, district engineer of the company, admitted that when work was being done in a cell the tray when in position was a safeguard. He did not look into the cell to see if the tray was in position.

It was stated that deceased received a shock from current of about 12,500 volts.

The jury returned a verdict of accidental death, and expressed the opinion that the accident would not have occurred if the regulations had been complied with. Mr. Burton, on behalf of the company, expressed sympathy with the relatives.

London County Council.—On Tuesday the adjourned recommendation of the Highways Committee to expend £21,300 on the extension of the tramways in the East India Dock-road, and £18,150 on adapting a portion of the tramways in the Seven Sisters-road for electrical working, were agreed to.

Electricity Loan.—In May Stepney Council applied for a loan of £15,710 for laying feeder mains, and requested that the amount, which ordinarily would be subject to repayment over 30 years, might be granted with the proviso that no repayment should take place during the first three years. They further asked that all loans in respect of machinery and mains for electricity account should be subject to a three years' suspension of repayment. The County Council would not agree, and the loan was granted on the usual terms. The Borough Council were not satisfied, and after considering a memorandum by Mr. Gordon, the Finance Committee now reported that they considered a case had been made out for concession. The Committee, however, had dealt with the case solely on its merits, and desired it to be understood that their recommendation must not be held to have committed them to approving the principle of generally allowing a postponement of repayment of loans for electricity mains and machinery. The reasons given by the Committee for their decision are (i.) The work in respect of which the loan is required (laying a large feeder main) is part of a large scheme for the supply of electricity over the whole of the borough, the present requirements and anticipated demands for current having rendered it advisable for the Borough Council to undertake large extensions and to change the whole system of generation of current; (ii.) it is estimated by the Borough Council that the feeder main in question will not be fully productive of a revenue until 15 years have elapsed; (iii.) it is urged nevertheless that it is more economical to do the whole of the work at one time rather than to do it in stages as the demand grows. In order to meet the exceptional circumstances of the case the Finance Committee advised the Council to sanction the repayment of the loan by equal instalments of principal within the last 27 years of a period of 30 years from the date of the borrowing.

Luton.—An inquiry was held here last week into the Council's application for sanction to borrow £13,497 for extensions of the plant at the electricity works and for laying mains, &c.

Digitized by Google

Margate.—The Council have entered into an arrangement with the Isle of Thanet Tramways & Lighting Co. for supplying and erecting 24 Osram lamps of 300 c.p. each on the Lower Foot Promenade and approaches at a cost of £101. 10s. per annum. Ten of the lamps are to be summer lamps only at £3. 3s. per lamp per annum.

Oldbury.—The Urban Council have instructed the Electricity and Tramways Committee to consider the possibility of arranging for a service of trackless trams or other suitable motor traction for passengers between Oldbury and Blackheath and Langley.

Public Library Lighting.—At the last meeting of Stoke Newington Council the Mayor (Coun. H. J. Beavis, J.P.) announced his intention to pay the whole cost of the electric light installation for the public library, and also the cost of lamps, estimated at £30, total £210.

Radcliffe.—The Council have consented to Bury Corporation supplying electrical energy to the Co-operative Wholesale Society's weaving shed in Dumer's-lane.

Torquay-Paignton Tramways.—Major Pringle made an official inspection of the Torquay-Paignton tramway on Monday and the line was opened for traffic.

Sales Managers' Association.—There was a meeting of this Association at the Holborn Restaurant last evening, when, after dinner, a number of speeches of interest to salesmen and sales' managers were dealt with. We are informed that Mr. F. R. Jones, Audrey House, Ely-place, London, E.C., will furnish particulars of the association.

Sheerness.—The Council have made an arrangement with the Sheerness & District Electric Power & Traction Co. for the electric lighting of five thoroughfares.

Smoke Abatement.—A meeting of the Advisory Committee of the Manchester and Salford Smoke Abatement Exhibition, which will be held on Nov. 10 to 25 next, was held at Manchester on 13th inst., and among those present were Councillor G. Howarth, chairman of Manchester Electricity Committee, and Mr. S. L. Pearce, electrical engineer to Manchester Corporation.

Councillor Kendall read a list of exhibitors who had booked space to date, and the following gentlemen were elected to the Advisory Committee: Councillors Wm. Kay and W. Dagnall, and Mr. E. D. Simon, secretary of the Smoke Abatement League of Great Britain. After the general business of the meeting, Councillor Howarth promised, on behalf of Manchester Electricity Committee, that domestic electrical appliances sold at the exhibition would be fixed and wired by the Corporation free of charge. It was proposed by Mr. Councillor Kay and seconded by Mr. S. L. Pearce that a letter should be sent to the National Electrical Manufacturers' Association with a view of obtaining their active support. Satisfaction was expressed at the success which is now assured to the exhibition, and also the prominent and influential part electrical appliances and electricity for power purposes will take in the exhibition and in smoke prevention.

Southport.—Application has been made for sanction to a loan of £1,500 for laying a duplicate electric cable to Crossens.

Wolverhampton.—On the recommendation of the borough electrical engineer (Mr. C. E. C. Shawfield) important extensions of the electricity undertaking are to be carried out at an estimated cost of £19,700 and the Council have applied to the L. G. Board for sanction to a loan of £11,000.

Mr. Shawfield, in a lengthy report, stated that the extension scheme was intended to deal with the present and future requirements of the generating station, with a view to providing that accommodation in the way of workshop and store-room facilities which were urgently necessary for the satisfactory and economical working of the station, and also to provide such additional means of meeting the present and future demands for current as was suggested by the experience of the largest and most successful generating stations. The estimated cost of buildings, &c., is £4,900, electrical machinery and switch gear, £3,000; overhead travelling crane and steel work for sub-station, £540, workshop equipment, £400, contingencies, £160—total £9,000. Various fittings and other items amoulting to £700 are charged to revenue, and £10,000 for supply, delivery and erection of a storage battery is charged to reserve. Mr. Shawfield urges the necessity of replacing the amount proposed to be taken out of reserve as quickly as possible, and he thinks that, if the profits of the undertaking allow, a sum of not less than £4,000 a year should be placed to reserve until it reaches the statutory amount of 10 per cent. of the capital.

Sports, &c.—At Bradford Hospital Fund sports on Saturday Hull Corporation tramwaymen's tug-of-war team won the Masham and the Herbert Gill Challenge Cups.

At the annual Hospital Carnival at Ilford on July 8 two cars equipped by the Council's electricity department, respectively demonstrating the advantages of electricity in the cottage and in the mansion, took part in a procession. An occupant of the latter car was a leisurely "slavey" (doubtless on the lines of the "That's done it" poster) and six attendant sprites represented different makes of lamps. These two cars, which were arranged by Mr. A. H. Shaw (electrical engineer to the Council) and some of his staff, took two out of four certificates.

Wedding.—On Tuesday the marriage took place at the Friends' Meeting House, Westminster, of Mr. Thomas E. Harvey, M.P., to Alice Irene, youngest daughter of Prof. Silvanus P. Thompson.

COLONIAL AND FOREIGN NOTES.

Australasia.—The "Australian Mining Standard;" says a meeting of telephone subscribers was held at Sydney recently, the Postmaster-General (Mr. J. Thomas) being present.

Several speakers complained that the service was defective, and Mr. Watt suggested that an automatic system might be useful.

Mr. Thomas said the present plant was admittedly not all up to date. When the Federation took control there was not a single metallic circuit in use, but 64 per cent. of the subscribers' lines were now metallic circuits. Only 24 out of 346 junction lines remained on single wire, and the work of changing them would not be stopped until the whole of the service was metallic. There were 30,000 subscribers, compared with 10,000 in pre-Federation days. In 1906-7 the expenditure on the system was £84,064, and this year it was estimated at £229,000. The staff in the city and central exchanges had increased from 247 in 1910 to 336 in 1911, and in the metropolitan area the staff increased from 503 in 1910 to 766 in 1911.

Mr. John Hesketh (chief electrical engineer to the Commonwealth Government) said he found from analysis of all the complaints received that the department was only responsible for 2½ per cent. of them.

The Official Year-Book of the Commonwealth of Australia contains statistics regarding the electricity supply works in the Commonwealth States in 1909. The heads of the particulars are: (A) number of stations, (B) number of employés, (C) horse-power of engines employed, (D) value of land and buildings occupied, (E) value of plant and machinery (F) wages paid during year, and (G) value of out-put. The figures are as follow:—

—	A	B	C	D	E	F	G
N.S.W.	103	769	40,479	£349,663	£1,047,680	£100,906	£620,478
Victoria	13	442	13,293	161,911	577,403	54,621	207,95
Queensland	6	90	4,517	15,429	74,797	9,865	44,149
S. Australia	1	149	5,068	28,030	262,710	17,175	...
W. Australia	18	218	84,632	64,586	452,230	42,198	265,215
Tasmania .	7	159	8,564	7,825	106,984	17,180	65,400
Total ...	148	1,827	86,583	627,414	2,521,804	241,945	1,143,201

The value of output in South Australia was not disclosed.

British North Borneo.—At the meeting last week the chairman (Sir West Ridgeway) said that there were in the State 625 miles of telegraph and 313 miles of telephone line. They had also sanctioned a scheme of telephone communication between the different estates and district headquarters on the West Coast, the cost of which will be practically defrayed by the contributions of the companies interested.

France.—A great extension of the outer part at Nice harbour is being pushed forward and expected to be completed in 1912. The quays are lighted electrically, and four new electric cranes have been ordered.

Germany.—A report states that new issues of stock and shares (municipal and companies') in Germany amounted to £120,000,000 in 1910, and £27,000,000 worth of foreign scrip was also floated on the market. Electricity and gas companies raised their share capital by nearly £4,000,000, compared with £1,000,000 in 1909.

Imports of iron, iron goods and machines in 1910 were valued at £7,735,000 and exports of the same classes of goods were £65,700,000.

All electrical works have made rapid progress and have developed phenomenally, though the returns and dividends do not show corresponding rise, owing mainly to severe competition. One of the largest electrical firms increased the number of its hands from 33,056 in 1909 to 41,663 in 1910, and turned out 72,460 electrical machines compared with 47,351 in 1909; it also turned out 174 steam turbines of 363,188 H.P. in 1910 against 152 engines of 226,507 H.P. in 1909; its insulating material turnover increased by 60 per cent.; the sale of metal filament lamps increased 100 per cent.; it turned out motors of 350,000 H.P., but the company only increased its dividend from 13 to 14 per cent.

A report from the Grand Duchy of Baden says trade in machinery and tools for factories was satisfactory, the exports especially increasing. However, electric power being substituted for steam is influencing the trade to some extent. An increased import duty on machinery is suggested. British competition, especially in the north, where freight cost is lower, is said to be detrimental to German industry. Mannheim firms, for example, are said to have greater freight expenses to the north of Germany than British firms.

Madeira.—A consular report states that the Madeira Electric Light Co. during 1910 extended its mains in many directions.

The company is substituting Diesel oil engines for steam plant, and the distribution system will be gradually changed to the three-wire system.

The project for the installation of a telephone service appears to have been abandoned. It is considered that a telephone service would be a great boon if the charges were not too high.

Digitized by Google

Russia.—Ekaterinoslav Municipality have been authorised to borrow about £274,000 for tramway and other works.

Spain.—An electric tramway is being constructed from the northern end of Barcelona across the mountain of Tibidabo (at an elevation of 1,500 ft.) to the manufacturing town of Rubi. The work is proceeding slowly as the authorities have insisted on the company increasing the width of the road by 2 metres.

The large works, known as La Industria Electrica, have passed into the hands of Siemens-Schuckert Co., who have built an up-to-date factory in Cornella, a suburb of Barcelona, and it may now be considered that nearly the entire electrical manufacturing business there is in the hands of German makers.

Imports into Barcelona in 1910 included electrical material 260 tons (compared with 1,434 tons and 444 tons in 1909 and 1908) of which total the United Kingdom supplied 7 tons (against 26 tons in 1909). Machinery imported from the United Kingdom was 3,985 tons (against 3,218 in 1909), from Germany 1,437 tons (against 1,250 tons) and from the United States 525 tons (380 tons).

A telephone exchange having been installed at Mercadel, all the towns in the island of Minorca can now communicate with each other either by telegraph or telephone. Electricity supply in Cindadela and Villa Carlos (Minorca) was inaugurated in 1910.

United States.—The British Consul at St. Louis states that of 110 makes of passenger motor cars made in the district 10 are driven electrically. The electric cars are generally used and driven by ladies.

The wages of workmen in the electrical industry are said to be 65c. per hour in St. Louis, 50c. in Kansas City, 34⅜c. in St. Joseph and 28c. to 45c. in other towns. The charges for electrical energy for lighting in St. Louis are 12c. per unit up to 100 units and 5c. per unit for all over 100 units. 4s. 2d. is the minimum charge per month. Large consumers for power, are, it is said, given a rate as low as 2c. In some large office buildings the electric company holds contracts for lighting the building, and to obtain this have included the heating. This has been done to induce the owners not to put in a plant of their own.

A large dam is being built across the Missippi at Keokuk, Iowa, and current will be brought thence in a year or two, when the present plants will be shut down, or kept as a stand-by.

ELECTRICITY SUPPLY AND TRAMWAY ACCOUNTS.

Bradford.—The income of the tramways department for the year ended March 31 was £270,965, including £256,063 traffic revenue, and £8,257 from parcels department.

The working expenses (£176,002) included £63,822 for traffic and £22,965 for general expenses, £32,287 for general repairs and maintenance and £47,717 for power. The gross profit was £94,964, and after paying £21,200 for interest, £2,530 income tax and £4,137 rent of leased lines and £30,695 for repayment of loans and sinking fund, £20,000 was voted to relief of rates and £19,374 placed to reserve. The total capital expended is £944,928, an increase of £14,814. The car-miles run amounted to 5,461,562, and 52,919,559 passengers were carried.

In the report of the general manager (Mr. C. J. Spencer) it is stated that there was an increase in traffic revenue of £10,380 over 1910, and in expenses of £5,302, and in gross profit of £5,966. The total nett profit was £39,374, against £32,365. The revenue of the department has been steadily increasing for years and the expenditure has not increased in the same ratio. The advent of the rail-less trolley system will, it is anticipated, open up a new field for extension purposes.

At present investigation is being made as to the possibility of adopting a new form of truck so as to minimise oscillation.

During the year Mr. Spencer gave evidence as to their practice in painting cars before the Home Office Committee which is investigating the question of lead substitutes in the painting of tramcars, &c., in lieu of white lead.

The through service of cars between Leeds and Bradford has proved very popular, and 256,407 through passengers were carried during the year. A dispute between Leeds and Bradford Corporations as to the allocation of fares has been referred to arbitration.

Norwich.—On Tuesday the chairman of the Electricity Committee (Mr. E. Wild) presented to the Council the annual report on the working of the electricity undertaking.

The report stated that there was an increase of 704,215 units in the output, or 17 per cent. increase over the 1910 figures. For private lighting 2,179,767 units were sold (against 2,008,167), public lighting 61,473 units (against 42,598) and power 2,576,172 (against 2,062,432). The income was £41,729, an increase of £4,097, and the expenses were £18,326, an increase of £4,340, but some special items were included. The gross profit was £20,866, a decrease of £243. Interest and sinking fund absorbed £15,122, compared with £15,146, leaving a nett balance of £5,744, compared with £5,963, a decrease of £218. With £3,728 brought forward the total available was £9,472. 17s. 10d., off which had been deducted £1,032, or amount expended to March 31 on public lighting. The balance (£8,441) was carried forward to be available for further expenditure on public lighting, and, among other things, a new battery of accumulators, which, with additions to the building and special machinery, would cost £5,100. The cost of new meters during the year was £198, and the cost of special renewals of mains amounted to £2,338. The increase in the cost per unit of coal was accounted for by an advance in price. It was anticipated that there would be a reduction in cost, but owing to the non-delivery of the new Willans-Siemens turbine set that was not obtainable. However, the total cost per unit showed a reduction from 0·943d. to 0·913d. The total length of distributing mains was 49 miles, an increase of 3½ miles. Some of the trunk mains in certain streets were relaid at a cost of £2,338. Those mains had been in use 17 to 18 years and were not sufficiently reliable or adequate for present requirements. They consisted of bare copper strip laid in culverts, and had now been replaced by cables drawn into conduits, provision having also been made for further cables as required. It will be necessary from time to time to relay other mains, and the committee anticipate having to spend further considerable amounts for the purpose. Work on the large new storage battery at Duke's Palace Wharf was proceeding, but it was not expedient to go to the L.G. Board for a loan, as the Board would only sanction seven years for repayment of loans for accumulators, and the Committee decided that it would be better to pay the cost out of revenue. A considerable number of the gas lamps have now been converted to electric lighting and the remainder of the first section will be completed by Sept. 30 next. The total cost of altering the lamps in the section will be about £5,000, and the Committee propose to pay this out of revenue.

Poplar (London).—The accounts of the electricity supply department for the year ended March 31 have been issued and show a net profit of £3,877, against £4,426 in 1910.

The net income from the sale of current was £45,953, an increase of £3,702. The working expenses were £25,248, an increase of £3,412, leaving a gross profit of £20,705, an increase of £289. After providing for interest on loans (£8,989) and repayment of loans (£8,595) the balance was £3,122. After making provision for small charges (£89) and adding income from property, sale of lamps, &c. (£844), the net balance was £3,877 (decrease £549), making with £5,337 from previous year's accounts a total surplus of £9,213. The engineer and manager (Mr. J. Horace Bowden) recommends that £2,386 be applied in paying for services and meters during the year and other work, leaving £6,828 to be carried forward. The new loans raised during the year amounted to £8,910, but £8,595 was paid off, leaving a balance of £250,269. During the past three years the output has increased 73·6 per cent. and the capital only 5·45 per cent.; the net profits have increased by 45·5 per cent. but the charges for supply have been reduced 25 per cent. Extensions of buildings and plant are proposed which will increase the capital to £320,000 and the generating plant by 6,000 kw. The cost of coal per unit sold rose from 0·291d. to 0·31d., but the total cost of production was reduced from 0·665d. to 0·659d. and the total charges from 1·156d. to 1·098d. There was an increase in the output for power of 25¾ per cent. and in private lighting of 2 per cent., but in public lighting a drop of ½ per cent.

West Ham.—The accounts of the electricity undertaking for the year ended March 31 show total capital expenditure of £503,357, an increase of £46,495.

The total income was £93,497 (against £79,454), and included £26,581 from sale of current for private lighting (against £22,928), £37,823 from power supply (£29,179), £21,593 from traction (£20,165), £6,619 from public lighting (£6,589) and £252 from heating (£163). The expenses were £55,858 (against £48,814), and included £32,662 for generation, £4,649 distribution, £1,889 public lamps, £6,620 rents, rates and taxes, £5,307 establishment charges, £4,170 special charges and £514 net deficit on sales department. The gross profit was £37,639 (against £30,640), and after providing for contribution to sinking fund (£23,626) and interest on and repayment of mortgage loans (£7,404), making for provision of stores (£2,100) and special works (£3,070), including £1,413 for meters and £754 for depreciation of motors, a sum of £1,758 was applied for paying the capital debt on accumulators and arc-lamp rectifiers, and £2,229 the outstanding debt on transformers, &c. 22,690,266 units were sold (against 19,156,399), including 2,253,904 for private lighting (increase 15·6 per cent.), 14,518,555 for power and heating (increase 24·2 per cent.), 5,182,257 for traction (increase 7·6 per cent.) and 735,550 for public lighting (increase 5·4 per cent.). The average price obtained per unit was the same as in 1910; there was a record increase in the sale of current for private lighting, due to metal filament lamps. The percentage of capital repaid to capital expended is 27. There was a slight increase in cost of coal, due to increased price, decreased load factor and other causes, and the total cost per unit decreased from 0·93d. to 0·888d. The results of the sales department show an improvement, but owing to the heavy capital charges (the period of the loan being only three years) the department is somewhat handicapped. The schemes for the hire of arc lamps and motors also show improvement.

TRADE NOTES AND NOTICES.

TENDERS INVITED.

HAMMERSMITH (London) Council invite tenders for supply of h. and l.t. feeder cables and stoneware ducts. Specifications and forms of tender from the borough electrical engineer (Mr. G. G. Bell), 85, Fulham Palace-road, W. Tenders to town clerk (Mr. H. Thompson), Town Hall, Hammersmith, W., by 4 p.m. July 26. See also an advertisement.

Tenders are invited for supplying plant and materials and the erection of electric supply station buildings for lighting the DUNDALK Urban District area, under its Electric Lighting Order, 1897.

Digitized by Google

The plant includes generating station buildings, gas producing and generating plant, balancer and booster, switchboard, storage battery, mains (overhead and underground) electricity meters and travelling cranes. Copies of specifications, general conditions, &c., may be seen at the offices of the clerk, Mr. Mathew Comerford, Town Hall, Dundalk, or at the offices of the consulting engineers, Messrs. T. L. Miller, Wilson & Pegg, Donegall-square, Belfast, 709, Tower-buildings, Liverpool, or 19, Brazenose-street, Manchester. Tenders to the town clerk, Dundalk, by 10 a.m. July 24. See also an advertisement.

Tenders are invited by the FARNHAM GAS & ELECTRICITY Co. for the supply and erection of two high-speed Diesel oil engines coupled to two 90 kw. alternators with direct-coupled exciters, piping, tanks, overhead traveller and accessories, and main high-tension switchboard. Specifications, drawings and forms of tender may be seen at, but not obtained from, the offices of the consulting engineers (Messrs. Handcock & Dykes), 11, Victoria-street, Westminster, S.W., and copies of the specifications, drawings and form of tender may be obtained from the Secretary of the company, Mr. Arthur E. Saville, to whom tenders are to be sent by noon of Aug. 16. See also an advertisement.

Tenders are invited for the supply of 530 a.c. meters, 495 d.c. meters and 133 maximum demand indicators to the City of MELBOURNE, Australia. Copies of specification, conditions of contract and form of tender from the agents for the City Council (Messrs. McIlwraith, McEacharn & Co. Propy. Ltd.), Billiter-square Buildings, London, E.C., to whom tenders are to be sent by noon Wednesday, Aug. 9. See also an advertisement.

Tenders are invited up to Aug. 23 for the supply of telegraph and telephone material to the Postmaster-General's Department in SOUTH AUSTRALIA. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W. See also an advertisement.

LONDON County Council require tenders by 11 a.m. Aug. 1 for installing about 250 lamps at Great College-street elementary school, Rochester-place, N.W. Specifications, &c., from the Chief Engineer, Spring Gardens, S.W.

LONDON County Council also require tenders by 11 a.m. July 25 for roadwork and platelaying of conduit system tramways in Green-lanes, Mildmay Park and Southgate-road and Seven Sister's-road, and for the construction of a tramway from Brixton to Herne Hill on the overhead system and for paving works and street widenings. Specifications from the Chief Engineer.

BRADFORD Corporation invite tenders for the supply and erection of two water-tube boilers, stokers and superheaters, and one 12-ton electrically-operated overhead travelling crane. Tenders to the Town Clerk, Mr. Frederick Stevens, by 10 a.m. Tuesday, July 25.

WOLVERHAMPTON Electricity Committee invite tenders for the supply, delivery and erection of a 264-cell, 6,000 ampere-hour storage battery together with a motor-driven regulating switch; two motor-driven boosters (approximately 150 kw. output each) and switchgear and instruments. Specifications from the borough electrical and tramways engineer, Mr. C. E. C. Shawfield, M.I.E.E. Tenders, addressed to the Chairman of the Electricity Committee, Town Hall, Wolverhampton, must be in by 10 a.m. July 31.

ANNFIELD PLAIN Industrial Co-operative Society (Ltd.) require tenders by noon July 24 for electric lighting of branch stores, Chopwell. Specifications, &c., may be seen at the architect's office, 22, Durham-road, Blackhill.

The Knowles Oxygen Co. (Ltd.), WOLVERHAMPTON, want tenders for the erection of a complete station with plant to generate 440-volt d.c., with an output of 1,000 kw.

PEMBROKE (Ireland) Council require tenders by July 31 for installation of electric light in new artisans' dwellings and new streets. Specifications, &c., the Clerk.

Tenders are invited (up to Aug. 15) for the supply of (*a*) 80,000 insulators and (*b*) indiarubber covered wire to the Postmaster-General's Department in VICTORIA,; up to Aug. 16 for cable, conduits, c.i. pipes, iron poles, insulators, wires, &c., and up to Aug. 23 for the supply of letter box fronts to the Postmaster-General's Department in QUEENSLAND.

Tenders are also invited up to Aug. 8 for measuring instruments, telephone instruments and parts, trembling bells and gong to the Postmaster-General's Department in VICTORIA; and up to Aug. 23 for telegraph, telephone and electric lighting material to the Deputy Postmaster-General in NEW SOUTH WALES. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W.

Tenders are invited up to Aug. 30 for the supply of porcelain insulators, copper wire, sleeves, &c., to the Postmaster-General's department in SOUTH AUSTRALIA. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W.

The Metropolitan Water and Sewerage Board, Albert-street, BRISBANE, Queensland, want tenders by noon Jan. 30 next for supply and erection, of one, two or three complete units, each consisting of power generating plant and pump or pumps to lift not less than 6,000,000 gallons per day. Particulars from the Secretary.

MORTLAKE (Victoria) Butter & Cheese Factory Co. require tenders by noon Aug. 14 for supply of dynamo and booster, storage batteries and accessories, switchboard, cables, &c. Specifications from Messrs. F. A. McCarty & Co., 31, Queen-street, Melbourne.

WELLINGTON (N.Z.) Corporation require tenders by 4 p.m. Aug. 24 for supply of a motor power waggon and accessories for the electric tramways department. Gonville and Castlecliff Tramway Board, Ridgway-street, WANGANUI (N.Z.) require tenders by 4 p.m. Aug. 14 for supply of overhead tramway material, feeders, &c. Conditions, &c., can be seen at 73, Basinghall-street, London, E.C. Representation in New Zealand is necessary.

STAVROPAL (Caucasus) Municipal Council invite tenders until Aug. 14 (O.S. Aug. 1) for the construction and working of an electric tramway.

Tenders will be received at the Town Hall, SYZRAN, Russia, on Oct. 14, for the construction of an electric tramway and the supply of electrical energy for lighting.

PHILIPPOLIS (Bulgaria) Municipality require tenders by Aug. 4 for a 50 years' concession for electric or gas lighting and for the provision of electric tramways. A deposit of £6,800 is required.

Tenders will be received at the State Railway Offices, STANISLAUS, Austria, on Aug. 1 for supply of five electric motors.

The Ministry of Marine, Rio de Janeiro, will receive tenders until Aug. 21 for supply and fixing of an electric lift and an electric crane at the Naval Depot on the Island of COBRAS. Local representation is necessary.

Tenders will be received at the Ministry of Public Works, Rio de Janeiro, until Sept. 25 for supply of electric light fittings, fans, lamps, conductors, &c., for the new Postal Telegraph building, PORTO ALEGRE. Upset price £3,100. Local representation is necessary.

TENDERS RECEIVED AND ACCEPTED.

Bolton Tramways Committee have accepted the following tenders: Foster Engineering Co. and W. E. Burnand & Co., single-phase transformers; Ferranti Ltd. and British Westinghouse Co., three-phase transformers; British Insulated & Helsby Cables, surface and cable boxes, &c.; British Thomson-Houston Co., incandescent lamps; British Insulated & Helsby cables, insulated cables; British Westinghouse Co., Bat Meter Co., Chamberlain & Hookham and Electrical Co., meters; Ferranti Ltd., motor starters; British Westinghouse Co., continuous-current motors.

London County Council have accepted the tender of Dick, Kerr & Co. (at £2,180. 11s. 10d.) for laying stoneware ducts on Brixton to Herne Hill tramways, and that of Le Carbone (Ltd.) (at £49. 5s.) for motor and generator brushes.

Islington (London) Council have accepted the tender of Allen & Simmonds (at £124. 8s. 6d.) for supplying new pistons to an engine at the generating station.

At the last meeting of Stoke Newington (London) Borough Council the tender of Messrs. W. J. Fryer & Co. was accepted for the installation of electric lighting, wires and fittings at the Public Library, Church-street, N., for £180. 5s.

Buckingham Council have accepted the tender of the local electric light company for street lighting for five years at £140. 7s. 6d. per annum.

Swinton and Pendlebury Council have placed an order with Callender's Co. for overhead cables to the Moorside works.

Heston and Isleworth Education Committee have accepted the tender of G. N. Virgo for wiring three schools at £92. 18s.

The D.P. Battery Co. have secured the contract from Aberdeen Corporation for the renewal of the Cults sub-station battery.

Dover Council have placed orders with the Brush Co. for three car bodies, at £303 each, and with the British Thomson-Houston Co. for electrical equipments at £272 per car.

Dewsbury Council have accepted the tender of Cowans Limited for a feeder switchboard, and that of Callender's Co. for a feeder cable.

Foot's Cray (Victoria) Council have accepted the tender of the Union Electric Co. for 30 Excello arc lamps and patent swinging centre-pole carriers and high and low-tension switchboards.

Eaglehawk (Victoria) Council have accepted the tenders of W. McLean & Co. for supply of cables, wires and insulators for their electric lighting scheme at £1,293, and that of R. Hornsby & Sons, for 81 M.B.H.P. engine and suction gas plant, at £943. 5s.

Digitized by Google

BUSINESS NOTICES.

The Armorduct Mfg. Co. have opened a depot at 137A, Suffolk-street, Birmingham, where stocks of the company's specialities will be kept. The company's representative is Mr. H. B. Done.

The partnership between Ebenezer Ryan and Geo. Bristow (trading as W. M. Ryan & Son), electrical engineers, 2, Church-lane, Leytonstone, and 16 and 17, Devonshire-square, London, E.C., has been dissolved. Debts by Mr. Ryan, who continues the business.

Patents Development.—The proprietors of British patents No. 14,304/1899 and No. 16,489/1902, relating to "Improvements in and the application of electric motors for automobile vehicles," desires to enter into arrangements for developing same in this country. Inquiries to Messrs. W. P. Thompson & Co., patent agents, 285, High Holborn, London, W.C.

The proprietor of patents No. 16,577/07 and 13,837/08, relating to "Improvements in frames for supporting electric conductors in the open," desires to grant manufacturing licences. Particulars from Mr. Clement Lean, 231, Strand, London, W.C.

"Stannos" Wiring.—Messrs. Siemens Brothers & Co., Caxton House, Westminster, S.W., notify that, owing to increased manufacturing facilities and the reduced price of rubber, they have increased the discounts off the price of "Stannos" wire and fittings as from 17th inst. Particulars will be supplied on application.

BANKRUPTCIES, LIQUIDATIONS, &c.

A meeting of creditors of the Bombay Hydro-Electric Synd. (Ltd.) will be held at 208, Gresham House, Old Broad-street, London, E.C., on July 24, and claims are to be sent to Mr. F. J. Horne, 214, Gresham House, by Aug. 14.

A receiving order has been made against Alfd. Sitch, electrical engineer, &c., 77, Brecknock-road, London, N.W. First meeting of creditors at Bankruptcy-buildings, London, W.C., on July 26, and public examination on Sept. 5.

Cuthbert Fenton Lindop, electrician, 62, Dale-street, Liverpool, has been adjudicated bankrupt.

A receiving order has been made against Wm. Hy. Ridpath (trading as Ridpath & Wells), electrical engineer, 20, Bath-street, Ilkeston.

First meetings of creditors and contributories of J. G. Childs & Co. (Ltd.) will be held on Aug. 1 at 33, Carey-street, London, W.C.

COMPANIES' MEETINGS AND REPORTS.

Telegraph Construction & Maintenance Co. (Ltd.)

The half-yearly general meeting was held yesterday under the presidency of the Right Hon. the EARL OF SELBORNE, K.C., chairman of the company.

The SECRETARY (Mr. C. W. Clarke) having read the notice convening the meeting,

The CHAIRMAN said: Gentlemen, I have very little to trouble you with on this occasion. Your business is progressing satisfactorily, and the usual interim dividend has been declared. On the occasion of the Naval Review the "Colonia" went down to Portsmouth, and we took that opportunity of inviting to meet on board, not our private friends, but those who are concerned mainly with your business—the representatives, rather, of other businesses with which your business is brought into contact; and although we certainly enjoyed ourselves greatly, yet I think that the occasion was not amiss in your interests, because it enabled all those who are connected with the manufacture and the use of cables to meet in rather an unusual manner, know each other, and discuss matters. On the last occasion of this half-yearly meeting, you yourselves, gentlemen, expressed a doubt whether there really was any occasion to hold it. Let me remind you how our meetings at this time of the year originated. Forty years ago, when the business of the Company was not exactly in the position in which it is now, certain of the shareholders desired to have this half-yearly meeting, at which no accounts would be presented, but which would enable them to come into contact with the Directors, to ask questions, and to ascertain how the business of the Company was progressing. Now, I would ask you, does the same occasion exist to-day for this half-yearly meeting as existed 40 years ago? The shareholders' doubts on this point are shared by the Directors, and I give notice of our intention, at the next annual general meeting, to propose to the shareholders to omit for the future this half-yearly meeting. That is really all I have to say to you to-day.

Mr. H. S. S. CROFT: There certainly does not seem to be the same reason which prevailed many years ago for holding this meeting: and if that is the feeling of the board—and I imagine it is shared by the majority of the shareholders—then the board would be quite justified in suggesting that this meeting should be dispensed with. At the same time one cannot, of course, help feeling that occasions sometimes arise in the interval between the meetings which would make it interesting for the shareholders to know exactly the position of things. I do not see that there could be any necessity for presenting accounts—that, of course, has never been done at this meeting—but there might sometimes arise some unprecedented circumstance which would make it rather important for the shareholders to know what the state of things was. For instance, on the present occasion, I should like to ask whether the strike which, as we know, has been operating so very disastrously in the shipping trade has affected this Company in any way. You have alluded to the presence of one of our ships at the Naval Review, and I know, from other sources, that some of the large steamers were actually prevented from taking passengers in consequence of the strike, which, as I say, has had rather as disastrous effect elsewhere.

The CHAIRMAN: I would remind you, gentlemen, that it is in your power to have a meeting summoned if you wish it, and I think that that meets the point which has been referred to. I am glad to say, as to the relations between the Company and its employees on the telegraph ships, that the strike at Southampton did not affect us. I cannot, of course, say what is going to take place in the future, but we have every reason, from our experience in the past, to suppose that the existing relations between us will continue. That concludes our business.

A cordial vote of thanks to the Chairman and directors terminated the proceedings.

Electric Construction Co. (Ltd.)

The eighteenth annual general meeting was held yesterday, Mr. WALTER S. B. MCLAREN, M.P., presiding.

The SECRETARY (Mr. David Willock) having read the notice convening the meeting and the report of the auditors,

The CHAIRMAN then said: Gentlemen, I am pleased the forecast of an increased demand for electrical machinery and of increased profit I made last year, has been fulfilled. We have not been engaged on large contracts, but the number of machines supplied for industrial purposes at home has been greater than in any previous year. We have experienced a diminished demand for electrical machinery for mining purposes, but I am glad to think that the questions which have arisen under the new Mines Regulations are now in a fair way of being solved. After several years' experience of the use of electrical machinery in some of the largest collieries in the country, I can say that, where reasonable and proper care is exercised, mining operations can be carried on with probably a greater degree of safety than with the older appliances. The demand for our plant for Colonial markets continues to expand, and during the year we have opened up new connections.

The resumption of dividends on the ordinary shares depends upon overturn. This view has been fully demonstrated during the past year. Our plant and tools have been fully employed during the greater part of the year, but our standing charges were not materially increased. Moreover, we obtained the full use of the up-to-date tools which we had installed, and our low prime cost per kilowatt produced proves conclusively the wisdom of the management in recommending such expenditure, and of the Board in authorising it—at a time when the outlook for the industry was not encouraging. The result of the year's working is that we are able to recommend a modest dividend of 2½ per cent. on the ordinary shares—the first since 1904. It is a poor return for all the capital employed and all the skill and energy exercised in the conduct of the business, but it is something to find ourselves once more in a position to recommend a dividend, however small. We have commenced the new financial year with a larger amount of work on hand than last year, and, as stated in the Directors' report, we view the future with confidence if the present demand be maintained. I wish to emphasise this condition, however, because the capacity for production at home has not diminished, nor has the keen competition among British and foreign manufacturers in all parts of the world relaxed.

As indicated in the report, we have disposed of our holding of ordinary shares in the Madras Tramways. Our holding is now represented exclusively by 6 per cent. cumulative preference shares, and, as the traffic receipts are still developing, and the extensions (to which I referred last year) have now been sanctioned, our investment will yield a steady and satisfactory return. With part of the proceeds from the sale of these shares we have redeemed the remaining £10,000 second mortgage debenture stock and also £17,300 of our first mortgage debenture stock. During the past two years, therefore, we have redeemed £67,300 of debenture stock and the amount now outstanding is £182,700 only. This reduction has strengthened the financial position of the Company, reduced the charge for interest, and established a more equitable relation between the amount of our mortgages and the amount of share capital issued. As I informed you last year, the whole of the stock redeemed will be kept alive for the purpose of re-issue, if required, but we do not expect this will be necessary.

A net deficit of £18,827 arising out of the sale of the Madras tramway shares less the surplus on the redemption of our debenture stock has been debited to general reserve fund; but I would remind you that the sum of £10,000 was credited to this fund last year out of the surplus arising from the redemption of the first portion of the second mortgage debenture stock, and, therefore, the net debit to general reserve fund for the whole series of transactions has been £8,827 only. We have always recognised this fund as a reserve against realisations of shares in other companies, and the sum of £25,000 which will remain at the credit of the fund, if you adopt our recommendations to-day, is a very substantial reserve against our reduced holdings, which now amount to £73,331. 17s. 6d. There was an increase in gross profit on manufacturing and contracting of £8,075. Interest and dividends received show an apparent reduction of £434, due to an alteration in the period for which one of the dividends has been

Digitized by Google

calculated. On the other side of the account there has been a reduction in debenture interest of £1,813, and an increase in general charges of £1,203, due chiefly to the increased volume of business transacted. In common with others, our investments show some depreciation. They are entered this year at the market value, £277 having been written off. I am pleased to be able to inform you that the judgment in our favour in the action brought against us by a German concern for alleged infringement of a patent (which I reported last year) was unanimously confirmed by the Court of Appeal. We have not heard whether the plaintiffs intend to prosecute the matter further.

In conclusion, I wish to put on record how greatly the Board appreciates the patience and confidence of the shareholders during the past seven years. I also wish to record how much the improved position of the company is due to the untiring zeal of its staff, and how greatly we have been helped by the amicable relations which have at all times existed between the company and its workmen. I now move the adoption of the accounts and report and the recommendations therein.

Mr. JAMES GRAY (managing director) seconded the resolution.

In replying to shareholders,

The CHAIRMAN said that the item of shares in other companies were taken at par value, and although they were shown in the accounts, everybody knew that they were not worth par. On the other hand, the general reserve fund was deliberately car-marked to set against the depreciation in the price of the value of those shares.

The resolution was then agreed to.

The retiring directors, Mr. McLaren and Sir Irving Courtenay, were then re-elected, the retiring auditors were re-appointed, and a vote of thanks terminated the proceedings.

Chili Telephone Co. (Ltd.)

The twenty-second ordinary general meeting was held yesterday. Mr. GEORGE KEITH presided.

Mr. EDMUND PETLEY (the Secretary) read the notice calling the meeting and the certificate of the auditors.

The CHAIRMAN said: Gentlemen, ever since the earthquake disaster in 1906 our business year by year has been making steady progress. Last year the Chilian Centenary was celebrated, and it has also been a year of activity and progress in Chili, in which our business has largely participated. The currency revenue in Chili has increased about 10 per cent. during the year. This improvement was due to the general expansion of all classes of our service throughout the country. Whilst by far the larger part of the revenue is collected in annual subscriptions payable quarterly or half-yearly, the measured rate or toll system has for some considerable time been introduced for inter-town communications, which has resulted during the past year in a satisfactory increase in the revenue derived from that service. The working expenditure in Chili has also increased, but not in the same proportion as the revenue, and comes out at 48 per cent., or a decrease for the year of about 2 per cent., which may be principally attributed to the lower maintenance expenses produced by the transfer of overhead lines to the underground cables in the City of Santiago. The rate of exchange has also been favourable. The average rate for the previous year was 10·49d., and for the past year 10·90d. The income in Chili, converted into sterling, shows an increase for the year of £7,946. Interest and transfer fees are about £258 more, while the expenses in London show an increase of £126 due to small increases in salaries and office expenses. Income tax is also £204 more. Altogether the result of the year's business is a credit balance of £46,144, which after providing £22,805 for the reserve and £9,900 for the interim dividend paid in January, enables the Board to recommend the payment of a final dividend of £13,200, making with the interim payment a total distribution for the year of 7 per cent., free of income tax, and to increase the balance carried forward to next year's account by £238 to £3,225.

Turning to the balance-sheet, the issued share capital has been increased to £330,000 by the issue of new shares made last November. The reserve account stands at £52,300, and investments at cost £34,784. Altogether, I think I may congratulate the shareholders upon the result of the year's operations. A large amount of new construction has been carried out during the year. In addition to the ordinary work of joining up new subscribers to the existing exchanges throughout the country, the trunk line communication has been greatly increased and extended to a number of small towns where offices have been opened. The new districts of Tocopilla in the North and Malleco in the osuth have been developed, and offices opened in their principal towns. Over 1,900 miles of new overhead wire have in all been erected and equipped during the year. The work of placing the lines undergound in the City of Santiago has been progressing satisfactorily in advance of the paving of the streets. The overhead wires are being removed as the underground cables are laid, and a considerable improvement is beginning to show itself in the maintenance and service. As regards the current year, the business conditions in Chili continue to improve. Several sections of the Longitudinal Railway, which is to join Santiago with Iquique, is now in course of construction, and the works for the improvement of the Valparaiso and other ports are being carried out, all of which is in favour of the trade and commerce of the country. The dividend we now propose, making 7 per cent. on the increased capital, is a much larger distribution than we paid last year, and if our business continues to expand as it has been doing up to the present, I have every hope we shall be able to return next year to an 8 per cent. basis, although we may have to deduct the income tax.

The highly satisfactory condition and progress of our business reflects great credit on the management in Chili and the staff generally, to whom I have great pleasure in expressing our appreciation and thanks for their successful services during the past year. I now move the adoption of the report and accounts.

The Hon. HERBERT T. ALLSOPP seconded the motion, which was carried unanimously.

Resolutions approving the dividend, re-electing the retiring director and auditors, and according a hearty vote of thanks to the chairman and directors terminated the proceedings.

United River Plate Telephone Co. (Ltd.)

The twenty-fifth ordinary general meeting was held on Tuesday, under the presidency of Sir IRVING COURTENAY, Kt., M.A.

The SECRETARY (Mr. David Smith) having read the notice calling the meeting and the auditors' report,

The CHAIRMAN then said: Gentlemen, the result of our year's operations is, I think, highly gratifying, especially when we remember that the prosperity of the Argentine generally has not this year been so great as it might have been. In spite of disturbing factors the business goes on increasing, and a most satisfactory feature is that, although the large additions to our subscribers have entailed a severe strain on the staff and on our equipment, the service, I am glad to say, steadily improves. I mentioned last year how abnormal was the demand on our general service owing to the unusual influx of visitors from all lands into Buenos Aires. We got through that time of unusual pressure very well, and in August last we inaugurated a new common battery board in the Avenida Exchange, our most important exchange in Buenos Aires. Warm congratulations on this improvement have been received from all quarters. Two other exchanges transformed to the common battery system are just on the point of being opened, while important extensions to three of the already existing common battery exchanges have been carried out during the year, as well as extensions to several of the magneto exchanges. We have also completed and opened a common battery exchange in the Sanchaks district of Rosario, and as soon as we can come to terms with the municipality of Rosario we hope to instal a full common battery board in our central exchange in that city. In Bahia Blanca we have a common battery board undergoing its final test, and doubtless one of our duties in the near future will be the joining up of that city to Buenos Aires by trunk lines. The distance is about 500 miles, and the operation will be a somewhat costly one, but traffic between the two places is ever growing. There appears some probability that the Government will build large docks for warships in Bahia Blanca, and in that case communication with the federal capital will be an absolute necessity. In the city of La Plata, the provincial capital of Buenos Aires, we have, since I last met you, been granted a concession to put our plant underground. This concession came after years of constant and strenuous effort. We have been much hampered in La Plata by the fact that the lines were aerial and liable to damage by every severe storm, and the plant was somewhat old-fashioned, but until we got the concession we were helpless to improve matters. Now, however, the necessary plans for a new board and building will be taken in hand. We are engaged in building a new line between La Plata and Buenos Aires with creosoted pine poles carrying 20 circuits of different gauges to take both long and short distance traffic, the extensions having been rendered necessary by the continual growth in the number of messages between La Plata and other parts of our system. The city of Cordoba also claims attention, and already we have had plans prepared for a new building, and a new and modern switchboard will before long be necessary. In some of the smaller towns we have had to enlarge our boards during the year as the number of subscribers increased, while we have opened up in several towns where we had not hitherto been established. In most cases these smaller towns are connected up to the nearest large town, while in other cases through and direct communication with Buenos Aires has been necessary. You can thus see that we have been exceedingly busy during the year, notwithstanding that our operations were constantly hindered at the end of last year and the beginning of this by a series of storms and floods unprecedented in our experience. One satisfactory feature of the business is the increase in toll line receipts We have during the last few years extended the toll lines in many directions. The country, and especially the province of Buenos Aires, is developing rapidly, and it is our ambition to be worthy of our responsibilities. So far as possible we desire, of course, the development of the district and the development of our lines to proceed contemporaneously but we recognise that we have obligations to our subscribers as well as to our shareholders, and sometimes we find it necessary for a variety of reasons to build a line even before it would, taken by itself, be what one might call a payable proposition; but it gives me great pleasure to state that the growth of the toll line receipts has during the last year or two increased in the most gratifying way, and has more than justified the expenditure.

Another branch of our business to which we are looking with great expectations is the private branch exchange. In Buenos Aires we have already installed 73 of those exchanges, controlling 2,114 instruments through 265 exchange lines in banks, public offices and large business establishments, and their convenience has appealed to the commercial community. These private branch exchanges afford us an opportunity of gradually introducing the message rate, which system we hope to make universal, in the large cities at any rate. Owing to the constantly increasing demand for female labour in Buenos Aires we experience some difficulty in keeping the ranks of our operating staff fully supplied. We are, therefore, installing an operators' school in connection with the Avenida exchange on the most modern lines, and here in the future we shall train the girls. The directors record with deepest regret the death during the year of Mr. R. Inglis Runciman, chairman for many years of our local committee, one of the most universally respected members of the

Digitized by Google

British community in the Argentine. We have been fortunate in securing in his place Dr. Luis Drago, a lawyer of international repute. He was, as you will remember, one of those who took part in the arbitration at the Hague Conference. We have also secured as a member of the committee Dr. Federico Pinedo, a gentleman of the highest reputation in the Argentine. The Board in London has been strengthened by the addition of Mr. Eustace Quilter, an addition of real advantage to the company. From what I have said you will realise that the extensions which we have in hand and in contemplation necessitate fresh capital, and we propose to make an immediate issue of 40,000 new ordinary shares, offered to the ordinary shareholders at par.

There are one or two points in the accounts upon which I will comment briefly. The nominal capital has been increased by the 100,000 £5 shares authorised at the general meeting last year, and the new issue of 40,000 shares has been brought into the accounts, making our paid-up capital £1,150,000. The reserve is increased by the amount of the appropriation last year, and reserve for renewal of plant, &c., has also been increased, for we have this year charged direct to revenue the provision for renewal of plant, which hitherto we have only dealt with by means of an appropriation from profit. You have doubtless noticed that the expenditure on plant of all kinds is £1,376,539. Now telephone plant is unique. Its life at the best is comparatively short, and much of it, such as outside lines, poles and the like, is, from its nature, of a rapidly deteriorating character, although the use of cables and underground ducts in cities is modifying this to some extent. We propose, as you will see, to add a further appropriation of £25,000 to maintenance account. On the credit side our expenditure for the year is £177,821 on capital account and £23,011 in connection with the special replacement account, this latter account being opened to deal with the special expenditure in conduits, cables, boards, &c., necessitated by the change over from magneto to the common battery system in Buenos Aires. This work is now practically completed, and this year we have written off the balance, and in future all replacements of this nature will be debited against renewal of plant. Real estate has increased by £25,930, representing new buildings and sites for exchanges, &c. The increase of £30,000 odd in sundry debtors is owing to increase in business generally, and also represents sums paid as the work proceeds on account of jobs being done under contract. There is practically no change in the amount of our securities, and it is satisfactory to state that the market value is well in excess of the figure appearing in the accounts. Our stock of materials is £17,269 more than last year, the result of a general growth of the business. Profit and loss figures represent increases in receipts and expenses in the Argentine of £64,885 and £60,658 respectively, due to the fact that we have this year included our provision for the renewal of plant under the heading of "Maintenance." The profit for the year is £129,854, against £123,557 in the previous year. There is a proposal that £2,000 shall be voted to the staff provident fund, which promises to be a great help to the staff. It was started a year ago with 744 members and already the membership has increased to 1,444, with a monthly income from staff subscriptions of about $1,900. The directors recommend a final dividend of 5 per cent. on the ordinary shares, making 8 per cent. for the year (tax free). I now move the adoption of the report and accounts and the declaration of the dividend set out therein.

Mr. FREDERICK GREEN seconded the motion, which, after a brief discussion, was carried unanimously.

The re-election of Sir John Gavey, Kt., C.B., was then approved, as was that of Mr. Eustace Quilter. The retiring auditors, Messrs. Welton, Jones & Co., were re-appointed.

A vote of thanks to the Consultative Committee in the Argentine, to Mr. Parker, the general manager, and his staff, and to Mr. David Smith, the secretary, and the staff in London was proposed by the Chairman, seconded by Mr. E. Quilter, and carried unanimously.

A cordial vote of thanks to the chairman and the directors brought the proceedings to a close.

CHATHAM & DISTRICT LIGHT RAILWAYS CO.—The revenue for the half-year ended June 30 amounted to £21,444. 12s. 8d. and the expenses to £12,514. 4s. 2d., leaving £8,930. 8s. 6d. Deducting rent of Rochester Corporation lines (£1,871. 16s.), debenture interest (£1,234), &c., and adding amount forward (£633. 10s. 4d.) the balance is £6,236. 12s. 6d. The directors recommend payment of the preference dividend and a dividend at the rate of 3 per cent. on the ordinary shares, carrying forward £1,705. 12s. 6d. Traffic receipts show a small increase and expenses a small decrease, compared with the corresponding half-year of 1910.

CITY & SOUTH LONDON RAILWAY CO.—The report of the directors for the half-year ended June 30 states that receipts from all sources amounted to £93,873. 7s. 4d., and the cost of working was £42,738. 3s. 10d., leaving a profit of £51,135. 3s. 6d. Including balance forward, net revenue shows an aggregate total of £52,923. 4s. After making provision for debenture stock interest, rent charge, and the transfer to renewal fund of £1,500 and £800 for general purposes, a balance remains available for dividend of £36,049. 2s. 11d. The directors recommend payment of the full preference stock dividend and a dividend at the rate of 1½ per cent. on the consolidated ordinary stock for the half-year, leaving £2,797. 19s. 11d. to be carried forward. Inclusive of the estimated number of season ticket journeys, 13,318,622 passengers were carried, against 12,800,719 in the December half-year and 12,357,324 in the June half-year, 1910. The receipts were £87,591 against £86,103 and £83,413 respectively. The directors state with much satisfaction that the enormous number of passengers using their railway during the Coronation celebrations were carried without a single mishap or delay of any kind whatsoever. The high level subway, connecting the public subways of the Central London Railway and the booking hall of the company's Bank station was opened by the Lord Mayor in May, and its utility and convenience have been since amply demonstrated by the free use of the subway made by large numbers of the public. The directors announce with deep regret the death of their esteemed colleague, Mr. Harvey Ranking. The vacancy thus occasioned has been filled by the election of Mr. J. F. S. Gooday, formerly general manager of the London, Brighton & South Coast and Great Eastern Railways and now a director of both companies.

EAST LONDON RAILWAY CO.—In the report for the half-year ended June 30 the directors state that they had hoped to be in a position to make a definite statement as to the scheme of electrification which they had reason to believe would be adopted by the lessee companies. Owing, however, to unavoidable delay, the lessees have been unable to arrive at a final decision on the scheme prior to the issue of the report. At the same time the directors anticipate that the chairman will be prepared to make a satisfactory statement on the subject at the meeting.

EDMUNDSON'S ELECTRICITY CORPN. (LTD.)—Mr. P. D. Tuckett stated at the meeting last week that the gross trading profits had increased by £2,335, but the expenses were £517 more. The net profit (£5,369) was satisfactory in a year which had proved by no means favourable to electric supply undertakings. The increased loss on working the local authority undertakings was the one unsatisfactory feature of the accounts but was not so unsatisfactory as would appear at first sight, since £980 of the increase was due to additional interest and sinking fund charges. The output had increased by nearly 2,000,000 units, the private lighting output having increased 6 per cent., compared with 4 per cent., while the power output had increased 16 per cent., compared with 19 per cent. The lamp connections had increased by the equivalent of 107,298 33-watt lamps, against an increase of 88,935. The metal filament lamp was undoubtedly tending to stimulate new connections, while they might now consider that they had felt the worst of its adverse influence on revenue.

ELECTRIC & GENERAL INVESTMENT CO. (LTD.)—The gross profit on the transactions for the year ended May 31 was £11,848. 9s. 5d. After deducting all general charges and the interim dividend already paid on the preference shares, and providing for the proportion of the final dividend accrued on the preference shares to May 31, there remained £4,175. 17s. 10d. As a further reserve to meet depreciation in investments the directors have carried £2,975. 17s. 10d. to contingencies fund, thereby raising this fund to £78,924. 2s. 7d., leaving a balance of £1,200. The directors recommend that this £1,200 be distributed by payment of a dividend of 6 per cent. on the paid-up capital on the ordinary shares for the year. The warrants for the dividend on the ordinary shares will be posted on 27th inst.

In June, 1907, a scheme for the reconstruction of the company in order to extinguish the founders' shares was submitted to the shareholders, but the scheme had to be adjourned sine die as it was found impossible at the time to obtain the necessary majority of holders of founders' shares in its favour. The directors now submit an amended scheme, which they hope will meet with the approval of all classes of the company's shareholders. The proposals are to the effect that the existing 100 fully-paid founders' shares of £5 each be converted into 10,000 fully-paid deferred shares of 1s. each; that the investments deposited with trustees on behalf of the holders of the ordinary and founders' shares respectively, be capitalised by the creation and issue of £22,500 five per cent. redeemable debenture stock and of 30,000 fully-paid deferred shares of 1s. each, making in all 40,000 deferred shares of 1s. each; that there be issued to the holder of each founders' share £125 in 5 per cent. debenture stock, 200 deferred shares of 1s. each fully paid (of which 100 shares will represent the converted founders' share), and a cash distribution of £7; and that there be issued to the holder of each ordinary share 10s. in 5 per cent. debenture stock, and one deferred share of 1s. fully paid, and a cash distribution of 6d. The holders of the present founders' shares will receive 20,000 of the deferred shares, and the holders of the ordinary shares will receive the remaining 20,000 deferred shares, thus preserving the existing equities and rights of the two classes of shares.

GENERAL ELECTRIC CO. (LTD.)—At the meeting on Monday Mr. H. Hirst referred to the loss sustained by the company through the death of their late chairman and managing director (Mr. G. Byng). The company was evolved out of a small business which Mr. Byng started in the early eighties. Mr. Byng was at all times a brilliant business man, a deep thinker, thorough organiser and hard worker. Mr. L. G. Byng, who has been for a number of years actively engaged in the firm, has joined the board, Mr. Ernest Byng fills the position vacated by him—namely, the vice-chairmanship. Mr. M. J. Railing (a director since 1900), who had been nearly 20 years with them in different departments, and who during recent years managed their Witton works so successfully, joined them at the head office as general manager, and Dr. A. H. Railing, who enjoyed a brilliant engineering experience outside their firm, and who had been for the last four years the speaker's chief assistant in London, in order to add to his commercial and financial experience, went to Witton to take over the works management. The trading profits for the year (£107,858) showed a healthy increase of £16,728. Their depreciation was about £5,000 more than last year. During the present company's 10 years existence they had written off £186,000, not taking into account the £92,000 which they appropriated this year for writing off goodwill, and he was not making a sanguine estimate if he valued their assets at a considerably higher figure than they appeared in the balance-sheet. Their reserve account amounted to £202,103. This year they had been able to satisfy a long-cherished wish by writing down goodwill and patents to £1, which still left the reserve account at £110,000. Their investment account

Digitized by Google

was the same as last year, but it yielded £7,000 more, owing to the successful working of the British General Electric Co. in South Africa, and the satisfactory results of the Peel-Connor Telephone Works. They had recently formed the British General Electric Co. of Australia and the British General Electric Co. of China, and similar arrangements for India and the Argentine were under the directors' consideration. Those subsidiary concerns were practically departments of the company in the shape of limited companies so as to limit their responsibilities, and they were managed principally by selected members of their staff trained at their head office and works. Their engineering works at Witton turned out every description of motor and dynamo, from small motors for fans to turbo-generators of 5,000 kw. They installed lighting power plants for tramway companies, electric light stations, mines and country houses. They equipped factories and steamships and carried on every kind of electrical engineering work for Government departments, municipalities and trading concerns. The Robertson lamp still sold in very large quantities and the Osram lamp continued its great career. At present they were engaged in serious litigation for establishing the patents of the latter. Their carbon works—the only works of the kind in the country—had been a great loss to them in the past, but they had this year arrived at zero point. They were grateful to the Admiralty and Government departments, who did their best when ever they could to insist on the supply of British-made carbons. At present their works were fully occupied and extensions were being carried out.

INDO-EUROPEAN TELEGRAPH CO. (LTD.)—At an extraordinary general meeting on Monday, under the presidency of Mr. T. Herbert Tritton, the special resolution passed at the meeting on June 28 was confirmed. The resolution cancelled the existing articles of association and substituted a new set, which had been approved by the shareholders.

NATIONAL TELEPHONE CO. (LTD.)—The income accrued in respect of the business of the half-year ended June 30 amounts to £1,807,871. 13s. 3d. compared with £1,678,311. 18s. 5d. for the corresponding period of 1910, an increase of £129,559. 14s. 10d. The working expenses amount to £1,058,169. 6s. 9d., compared with £971,914. 6s. 2d., an increase of £86,255. 0s. 7d. The net result (after deducting P.O. royalties amounting to £173,424. 7s.) is a profit balance of £576,277. 19s. 6d. compared with £544,516. 7s. 9d., an increase of £31,761. 11s. 9d. The rentals carried forward for unexpired terms of running contracts amount to £1,577,419. 0s. 10d., against £1,482,179. 1s. 8d., an increase of £95,239. 19s. 2d. Out of the available balance of £436,886. 13s. the board will recommend payment for the half-year of a dividend at the rate of 6 per cent. per annum on the first and second preference shares, 5 per cent. per annum on the third preference shares, 6 per cent. per annum on the preferred stock, and 6 per cent. per annum on the deferred stock, less tax in all cases. The board also propose to transfer £200,000 to reserve, and to carry forward the balance of £18,136. 13s. On March 20, 1911, the directors invited tenders for the repayment of part of the 3½ per cent. debenture stock, and up to May 31 last the amount of stock which had been thereby extinguished was £336,972. The sum of £211,121. 15s. 10d. has been expended on capital account during the half-year in the erection of 15,675 additional exchange and private stations and in the construction of underground works.

MARCONI'S WIRELESS TELEGRAPH CO. (LTD.)—At the meeting yesterday the chairman (Commendatore G. Marconi) moved the adoption of the report. He said the figure on the credit side of profit and loss account of £127,452, representing balance of contract and trading account, showed in itself the magnificent progress of the business. It had not been considered prudent to continue to set out the figures of the profit and loss account in the same form as submitted last year, but the accounts were treated in their books exactly the same as theretofore, and no profits had been taken into consideration on account of contracts in course of completion. There was no truth in the suggestion that the trading account embraced any sums received by way of compensation resulting from the patent action. He referred to the satisfactory working of the trans-Atlantic services, which had been opened in April last year. They had had, and would continue to have, some trouble owing to the mutilation of code words by the land-lines, but they had arrangements in view which would eliminate that trouble, and it was possible that at an early date they should carry into effect their intention of accepting plain English messages at 4d. per word, which should bring them in a great many messages in plain English which were now sent by code at 7½d. per word. He was engaged at the moment in introducing their duplex system at Clifden, and thereafter at Glace Bay, which should double the capacity of their service with a very small increase of running expenses. The work completed during the year included two stations in Brazil for the Madeira Maore Railway. Other important contracts entered into included the erection of stations in Italy, Turkey, Greece, Spain and the Canary Islands, while a first agreement made with the Eastern Extension Telegraph Co. for the erection of a station at Cocos Island was the first of a series of coast stations extending to Hong Kong, Singapore, Malta and Gibraltar, which should materially assist their international maritime business. Important negotiations had also been carried on with the French Government, which had resulted in a working arrangement between it and the affiliated Marconi companies, while a press agency had been organised upon the high seas. He also referred to a development from a scheme they had submitted to H.M. Government to put all British possessions into wireless communication with each other. The Imperial wireless scheme introduced by Sir J. Ward at the recent Imperial Conference would seem to have originated in that idea. They would have preferred to have carried out the scheme they themselves had proposed, but quite appreciated the attitude of the Government, and would be equally satisfied if eventually they erected the stations on terms which would compensate them for the large sums of money and the immense amount of work which the company had devoted to the development of long-distance commercial wireless telegraphy. No other company than their own had been able to erect stations for long-distance commercial radio-telegraphy, and they might recollect that they had succeeded in receiving messages between Glace Bay and Buenos Ayres, a distance of over 6,000 miles. They were engaged in negotiations with foreign Governments for the erection of other long-distance telegraph stations outside the British Empire. The judgment obtained against the British Radio-Telegraph & Telephone Co. had materially strengthened their position, and they were setting aside a substantial sum of money for vigorously protecting their patent rights throughout the world. They regretted that after the report was drafted they had found it incumbent to issue a writ against the Lodge-Muirhead Wireless & General Telegraphy Syndicate, who had, in turn, issued a writ against the Marconi International Marine Communication Co., and they should not hesitate to take further legal proceedings whenever it became incumbent. In regard to dividends, he said the board was unanimous in contenting itself for the present with the declaration of an interim dividend on the ordinary shares for the six months ended June 30 at the rate of 10 per cent. per annum.

SOUTH BRAZILIAN RAILWAYS CO. (LTD.)—The directors' report states that the concession and undertaking of the urban and suburban tramways of Curytiba, capital of the State of Parana, had been transferred to the company by the Empreza Ferro Carril Curytibana. Contracts had been entered into with Mr. E. Fontaine de Laveleye for converting the lines to electric traction. The contractor has undertaken to deliver the whole of the tramway system in working order not later than Jan. 22, 1912. During the period of electrification the contractor was working the public service, all receipts and outgoings during that period being for his account. The company had also purchased from the Empreza de Electricidade de Curytiba the electric lighting enterprise. Contracts had also been entered into with Mr. E. Fontaine de Laveleye, under which he would improve and extend the electric lighting system of the city and district, and also erect a hydro-electro plant at the Caiacanga waterfall, the concession for which had been acquired by the company. The contractor further undertook to connect such hydro-electric works with the distributing plant in the city. The company had also obtained from the Municipality of Curytiba the sole concession for the supply of electrical energy in the city. To provide for the acquisition of the electric lighting enterprise and the carrying out of the new works the capital was increased to £300,000 by the creation of a further 37,500 shares of £4 each. The board have also created a further 25,000 5 per cent. debentures of £20 each (second series), secured by a first charge on the electric lighting undertaking and a second charge on the tramway undertaking. Arrangements have been made with the contractor for carrying on the undertaking during the construction period.

CITY NOTES.

MEMORANDA (July 20).—**Bank rate 3 per cent.** (March 9, 1911. **Price of silver,** 24¼d. per oz. **Consols** 78⅞—79 **for money and to account. Consols Pay Day,** Aug. 2; **Stock and Shares Continuation Days,** July 26 and Aug. 14; **Ticket Days,** July 27 and Aug. 15; **Pay Days,** July 28 and Aug. 16; **Mining Shares Carry Over Day,** July 25

PRICES OF METALS (London).—*Copper*, cash, 56⅛; three months, 57⅝ *Lead*, English, 13⅛—14⅛; Foreign, cash, 13⅜—13½, three months 13¼—13⅛. *Spelter*, 24¾—25. *Tin*, English, 190—192; Foreign, cash 188½; three months, 182½. *Iron*, Cleveland, cash, 47/0, three months 47/9.

ANGLO-AMERICAN TELEGRAPH CO. (LTD.)—The directors have declared an interim dividend for the quarter ended June 30 of 15s per cent. on the ordinary stock and £1. 10s. per cent. on the preferred stock (less tax), payable on 1st prox.

BRITISH COLUMBIA ELECTRIC RAILWAY CO. (LTD.)—A circular has been issued by the directors inviting applications from existing stockholders for £600,000 new capital. Owing to the continuous increase in the trade and population of the cities and districts served by the company, a further development of the railway, light and power systems is necessary. The receipts for the 11 months ended May 31 increased over the corresponding period of 1909-10 by $1,110,733, or 41 per cent.

A dividend has been declared at the rate of 5 per cent. on the preferred ordinary stock for the half-year to June 30, together with an additional dividend at the rate of 1 per cent. per annum for the same period.

MADRAS ELECTRIC TRAMWAYS 1904 (LTD.)—This Company's traffic receipts for the fortnight ended July 16 were R.23,048 (increase R.3,672). Aggregate from Jan. 1, R.284,339 (increase R.22,891).

METROPOLITAN RAILWAY CO.—A half-yearly dividend is announced at the rate of 2 per cent. per annum, £4,000 being carried forward, against 1½ per cent. and a carry forward of £6,000 in June, 1910.

ST. JAMES' & PALL MALL ELECTRIC LIGHT CO. (LTD.)—The directors have declared an interim dividend on the preference shares at the rate of 7 per cent. per annum and on the ordinary shares at the rate of 10 per cent. per annum for the half-year ended June 30. The share transfer books will be closed from July 22 to Aug. 4 inclusive.

STOCK EXCHANGE NOTICE.—The Stock Exchange Committee has granted a quotation to 467,000 £10, fully-paid shares of *The Underground Electric Railways Co. of London (Ltd.)*

NOTES.

Electricity in Mines.

The debate in Committee on the Coal Mines Bill has been characterised by a certain want of knowledge on technical points. As an instance, we may mention the amendment proposed by Sir Arthur Markham to the effect that if in any place of a mine or part of a ventilated district of a mine the amount of inflammable gas in the air current exceeds one-half per cent. the use of electricity shall at once be discontinued in such places until the air current is clear or shall not contain more than the above amount of such inflammable gas. In order to make tests in regard to this point, safety lamps are to be provided which shall be capable of showing low percentages of gas, and such tests are to be carried out twice during every working shift by a competent person. Sir Arthur Markham evidently does not know much about gas analysis or he would not suggest a safety lamp as an instrument whereby to determine whether the amount of gas in the air is more or less than one half per cent. Apart from gas, there is the question of coal dust, so that a regulation of this kind would be practically unworkable. The Government objected that such a regulation would probably mean prohibition where safety lamps as well as naked lamps were used and that they could not enforce a condition of this kind without inconvenience to the management and to those working in the mine. Nevertheless, the amendment was mainly carried. It seems unfortunate that these matters should be arranged by people who are so ignorant of the technical points involved as an average member of the House of Commons.

The Education of Engineers.

In our correspondence columns this week Dr. Stanley P. Smith makes the somewhat startling assertion that the technical training of engineers in this country is by no means general; he goes on to state that in many of the departments of engineering faculties scarcely a dozen students reach the final year's course, and that in many colleges half this number would be nearer the figure. We scarcely think that this assertion can be maintained. Unfortunately, we have no means at our disposal for verifying such a figure; but as examples we may say that the average number of third-year engineering students in the City and Guilds (Engineering) College from 1906 to 1911, both inclusive, was 118, the lowest figure being 111 in 1906 and the highest 123 in 1909. At University College, the total number of students in engineering has seldom fallen below 100. Of course, there has been some falling-off in recent years in many cases, and this may be traced partly to the great multiplication of engineering faculties in provincial colleges and universities. This has very naturally had the effect of distributing the students more widely and diminishing them at some places, though probably the total number is larger than it was before. Further, the electrical industry has not been in a flourishing condition during the past few years, and this also must have produced some effect, at least in this particular branch of engineering.

We should certainly have thought that most engineers would by now have had some technical college training either at the City and Guilds Colleges, University College, King's College, Faraday House, the Northampton Institute, or some other technical school of University rank. On the other hand, when it comes to artisan apprentices, we think Dr. Smith is correct in taking the view that in Germany and other Continental countries the theoretical training is better than in this country. We believe that Continental

Digitized by Google

foremen have a much better theoretical knowledge than our foremen, and are consequently able to deal with work on a broader basis.

WITH regard to engineering degrees, and generally degrees of any kind, we think that Dr. SMITH is right in saying that they carry little or no weight. The reason for this is not far to seek and has been emphasised by Dr. J. A. FLEMING on more than one occasion, but we may well recapitulate some of the points he has raised. Such degrees are awarded too much as the result of written examination work instead of on practical laboratory work. The questions set are generally academic instead of being concerned with really practical problems, and the questions have to be answered without reference to books and against time. The result is that the man with a good memory is at an undue advantage, whereas, in practical work memory does not play such an important part.

OWING to the fact that students are keen on degrees the decision arrived at by the University of London some few years ago to give degrees in engineering has reacted in an undesirable way upon the teaching in our technical colleges. Instead of ample time being given to laboratory work, this is now sacrificed to the acquirement of book knowledge which will be useful in the examination. Although a certain amount of such knowledge is very desirable, more harm than good is done by overloading the memory in this way, for in actual life it is more important to know where information is to be found than to carry it in the memory. Initiative and the power of overcoming difficulties in actual practice are the most important qualities in an engineer, but they are by no means developed by this class of work. We agree with Dr. FLEMING that if engineering degrees are to be given they should be awarded under more practical conditions, and then, no doubt, they would be accepted as being of practical value.

The Official Secrets Bill.

ELECTRICAL engineers, whose business it is to deal with the supply of energy for lighting and power, are, we suppose, in general too occupied with that business in times of peace to consider the possible importance of the plant under their charge in time of war. That our rulers are not however oblivious to the strategical importance of electric generating stations is shown by clause 3 of the new Official Secrets Bill, which was introduced the other day by Lord HALDANE. This clause defines a "prohibited place" under the Act; this may include, besides works of defence, arsenals, dockyards and ships, any railway, road, way or channel or other means of communication, by land or water, or any place used for gas, water or electricity works. Before, however, such a place can be placed under the working of the Act, it has to be declared "prohibited" by a Secretary of State, on the ground that information with respect thereto, or interference therewith, would be useful to an enemy. The communication of information or retaining unauthorised information regarding a "prohibited place" is a misdemeanour under the Act and is punishable by imprisonment for not exceeding two years, with or without hard labour, or by a fine, or by both fine and imprisonment. Any person who "for any purpose prejudicial to the safety or interests of the State," approaches or is in the neighbourhood of a "prohibited place," or "makes, obtains or communicates any sketch, plan, model, article, note or other document or information" which might be or is intended to be directly or indirectly useful to the enemy, is guilty of a felony punishable by penal servitude. A person may be punished under this Act without being proved guilty of any particular action, if from his known character it can be proved that his purpose was prejudicial to the State. Inciting a person to commit an offence under this Act is a felony or misdemeanour, as the case may be, while harbouring spies is also an offence punishable by imprisonment.

IN our opinion the military authorities are quite right in recognising the importance to the enemy of information regarding such places as generating stations. Nothing is more prejudicial to the success of surprise night attacks than good illumination, and before part of a modern town of any size were invested it would therefore be the object of any enemy to cut off the supply of artificial light. For this reason any details regarding the position of the station and the arrangement of the plant in it and, more important still, the roads along which the mains were laid would be of great utility. Supply engineers might, therefore, now be saddled with the further responsibility of keeping details regarding their system and plants from "anxious enquirers" of every nationality. On the other hand, the whole force of such an Act lies in the way it is administered and, if precedent is anything to go by, we do not anticipate it will press very hardly on the ordinary electrical citizen.

"Tramways and Light Railways Legislation of the Future."—The concluding Paper read at the recent Congress of the Tramways & Light Railways Association at Edinburgh was by Ald. Wm. Ivey, and dealt with the above subject. The author described past tramway legislation at great length, and showed how the existing Acts should be modified to meet present and future requirements. Among the improvements suggested the abolition of the local veto was insisted upon. In conclusion, a model Bill embodying several proposed new clauses was sketched out.

The London Telephone Service.—"The Times" announces that a telephone conference of municipal representatives in the London telephone area (over which the Lord Mayor has undertaken to preside) will be held at the Guildhall in October. The efforts of the conference will, it is said, be directed towards deciding whether a flat rate shall be demanded or whether the Postmaster-General shall be asked to institute some other tariff. If the conference decides for a flat rate, efforts will be made to secure a maximum subscription of £10 per annum. Resolutions will be submitted calling upon the Postmaster-General—[Query, the Government?—ED. E.]—not to permit the telephone to be controlled by a Government Department and asking that a Board, on the lines of the Port of London Authority, shall be established, such Board to include representatives of the Post Office, the municipalities, traders and private telephone users. It seems to us that the conference would be well advised to stick to one thing at a time. The question of a Board is the important point; the subject of tariffs cannot be understood by the average layman.

Cable Interruptions and Repairs.

Electrolytic Disinfecting Fluid at Poplar.—The report of Dr. F. W. Alexander, Medical Officer of Health to the Metropolitan Borough of Poplar, shows that 50,726 gallons of electrolytic disinfecting fluid were made by the department during 1910. This included the fluid distributed to private inhabitants at the various depôts and the amounts used at the public baths, the workhouses, farm colony, asylum, electricity works and County Council schools. The cost of material and manufacture was £98, of which £50 was for electrical energy at 1½d. per unit. The plant is in good working order.

University of Yale.—It is announced that Mr. Chas. F. Scott has been appointed professor of electrical engineering at this University. This appointment is another example of the American practice of appointing men thoroughly trained in the commercial side of engineering work to high scholastic posts. Mr. Scott, after studying at the Ohio and Johns Hopkins Universities, entered the test room of the Westinghouse Electric & Mfg. Co. In 1897 he was appointed the company's chief electrician and in 1904 he became its consulting engineer. He was president of the American Institute of Electrical Engineers in 1902-03.

Proposed Memorial to the late Prof. J. Joubert.—It has occurred to a number of old fellow-workers, pupils and friends of the late Prof. Joubert that the time has now come when a memorial to his memory should take some concrete form. The proposal has received the approval of the Union des Physiciens, L'Institut Pasteur, La Société Française de Physique and La Société Internationale des Electriciens, while L'Academie des Sciences and L'Ecole Normale have also given the idea their support. A committee to deal with the question has been formed, and has decided that the memorial shall consist of scholarships at L'Ecole Supérieure d'Electricité, Le Collège Rollin, Le Lycée Fénélon and Le Lycée de Tours. Subscriptions should be sent to M. Gauthier-Villars, imprimeur-éditeur, 55, Quai des Grands-Augustins, Paris.

Electric Power on the Rand.—Interest was created by a statement published in the "Financial Times" a few days ago to the effect that steam power was to replace electric power on the Rand, because the latter had failed to rise to the occasion. The statement having been traced to its source, it was found that a report issued by the Victoria Falls & Transvaal Power Co. stated that, owing to the enormous demand for power on the Rand the old steam engine plants had been commandeered to supplement the electric supply pending the installation of the larger electric units now in course of erection or on order. This is, of course, quite another story. The economies effected by the introduction of electric power into the mines in the Witwatersrand District of South Africa have been very large, and the remotest possibility of steam plant being more than assisting in tiding over a period of stress or serving as a standby may be at once dismissed. Mr. A. W. Judd, secretary of the Victoria Falls & Transvaal Power Co., states that the statement of the chairmen at the recent meetings of the General Mining & Finance Co., and of the New Goch Co., that the saving by the change-over from steam power to purchased electric power is equal to 7·28d. per ton milled forms a complete reply to the statement published by the "Financial Times."

Current Topics.

Subjects of current interest dealt with in this issue include the following:—

An article by Mr. J. R. Dick deals with the resonance effects that occur in cables and their influence on breakdowns.

In a Paper (of which we give an abstract) read before the Tramways & Light Railways Association, Mr. C. W. Mallins goes into the question of the variations in first cost and cost of upkeep that exist in tramways operating in this country under very similar conditions.

Mr. E. Shepherd, in a Paper read before the same Association, discusses the advisability or otherwise of adopting transfer fares on tramway systems.

We give the first part of a description of the electrical equipment on board the new White Star liners "Olympic" and "Titanic."

We give an abstract of a report on Prime Movers which was submitted by a Committee to the National Electric Light Association at their recent meeting.

We conclude our report of the recent Engineering Conference organised by the Institution of Civil Engineers.

We give a short description of the petrol-electric equipment which has been installed on the "Electric Arc."

An excellent report is made by the Portsmouth Electrical departments, a total profit of £11,000 being shown, £6,000 on the tramways, £4,500 on electricity supply, and £500 on the telephone department. £9,500 is contributed towards the rates.

Abstracts are given of the accounts of Bristol, Broughty Ferry, Hammersmith and Weymouth electricity supply undertakings, and the Cardiff electricity supply and tramway departments.

Budapest Municipal Council are advertising for tenders for turbo-generators, boilers, &c.

Birmingham City Council decided on Tuesday to enter into an agreement to purchase for £151,500 the whole of the interests of the City of Birmingham Tramways Co. and the British Electric Traction Co. in Aston Manor, King's Norton and Northfield and Yardley.

Parliamentary.—A Select Committee of the House of Lords has this week considered the Rotherham Corporation Bill, which seeks powers for tramway extensions, the running of rail-less trolley vehicles, &c.

A House of Lords Committee has been considering the Greater London Railway Bill this week.

The Telegraph Construction Bill has been before a House of Commons Select Committee this week.

The Gloucester Corporation Bill came before the Chairman of Committees in the House of Lords last week when the new model clause as to wiring was inserted, and the Bill ordered to be reported for third reading.

The Brighton, Hove & District Rail-less Traction Bill will now go forward unopposed.

A House of Lords Special Committee has passed the London, Tilbury & Southend Railway Bill, which authorises the electrification of the line.

A House of Lords Committee has ordered the London County Council (Tramways and Improvements) Bill to be reported with amendments.

Legal.—The proceedings in the Court of Appeal in connection with the West Hartlepool Tramway transfer are of more than passing interest. The Hartlepool Electric Tramways Co. (Ltd.) and Messrs. Sellon & Ashby, the promoters of the tramways, were again successful.

Mr. Justice Swinfen Eady concluded the hearing of the action by the Thermal Synd. (Ltd.) against Silicaware (Ltd.), and has reserved judgment.

Mr. Justice Swinfen Eady on Monday declined to grant an application by the Electrical Co. for a variation of the judgment in the patent action recently brought against them by the British Westinghouse Co.

The Court of Appeal has allowed the appeal of the Central London Railway Co. against a decision of Mr. Justice Swinfen Eady with regard to land tax on a portion of the Company's works or property under the public highway.

At the County of London Sessions the appeals of the Gt. Western & Metropolitan Railway Companies in reference to the assessment of the Hammersmith & City Joint line in Kensington and Hammersmith were allowed, and the assessments reduced.

The Lord Chief Justice, Mr. Justice Lawrence and Mr. Justice Avory on Friday granted a rule nisi for a mandamus to Islington Council calling upon them to show cause why they should not have five testing stations to their electric lighting undertaking.

Fines were inflicted upon the Newcastle & District Electric Lighting Co. in consequence of the fatal accident to Mr. Middleton on April 6 last.

Companies' Meetings and Reports.—The Directors of the Mersey Railway Co. are able to make another good report showing an increase in revenue and large decrease in working expenses.

In this issue are reports of the meetings of the National Telephone Co., City & South London Railway Co., the Madras Electric Supply & Tramways Co., the Metropolitan Railway Co., the Electric & General Investment Co., and abstracts of the directors' reports of the Anglo-American Telegraph Co., Crompton & Co., the London, Brighton & South Coast and Central London Railway Companies, the Dublin United Tramways Co., South American Light & Power Co., the Lanarkshire Tramways Co.

OBITUARY.

ARTHUR STREET.—We regret to state that Mr. A. Street, assistant electrical engineer to Batley Corpn., received fatal injuries in a motor bicycle collision at Allwoodley on Monday morning. He was riding at the time with a friend, Mr. Arthur B. Chappel, of Shipley, and during a momentary turn to look back Mr. Street's front wheel caught the rear wheel of Mr. Chappel's machine. He fell over on his head, fracturing the base of the skull. He was at once driven to the infirmary near by, but succumbed to his injuries before reaching there. Mr. Street, who was much respected, leaves a widow and five children, the eldest only 11 years of age.

PERSONAL NOTES.

Mr. Gerald Hooghwinkel, M.I.E.E., M.I.M.E. (Messrs. Hooghwinkel Anthony Brown & Partners, and director of the San Luis (Mexico) Tramways, Ltd.), is leaving for Mexico and Cuba on 29th inst. on professional business, and also to prepare for the electrification of the San Luis Company's lines.

APPOINTMENTS VACANT AND FILLED.

Shanghai Municipal Council require for their electricity department an assistant clerk with experience in the office of a firm of electrical contractors. Three years' engagement. Salary about £24 per month. Free second class passage. Applications to Messrs. Preece, Cardew & Snell, 8, Queen Anne's-gate, London, S.W., by Aug. 3. See also an advertisement.

Test room assistants are required for adjusting and calibrating a.c. and d.c. ammeters, voltmeters and wattmeters; also for adjusting watt-hour meters. See advertisement.

The Rochester, Chatham and Gillingham Joint Higher Education Sub-Committee require a lecturer for engineering subjects. Commencing salary £150. Forms of application &c., from Mr. R. L. Wills, M.A., 2, Military-road, Chatham, to whom applications by Aug. 9.

A demonstrator or assistant lecturer is required in the physics department of the University College of Wales, Aberystwyth. Salary £150. Applications to the Registrar by Aug. 24.

York Electricity Committee have recommended the appointment of Mr. Rayner, of Rhondda, as charge engineer, at £91 per annum.

INSTITUTIONS AND SOCIETIES.

British Association.—We give below a list of Discussions and Papers which will be read before Section A of this Association at the forthcoming meeting at Portsmouth: Discussion on "The Principle of Relativity," opened by Mr. E. Cunningham; on "Stellar Distribution and Movements," opened by Mr. A. S. Eddington; and on "Mechanical Flight" (in conjunction with Section G), opened by Mr. A. E. Berriman. Papers on "Great Boundary Waves; Parallactic Tides set up in the Bottom Layers of the Sea by the Moon," by Prof. A. Petterson; "On the Infra-red Spectrum," by Major E. H. Hills, F.R.S.; "On Peculiarities in the Absorption of Salts by Silica," by Prof. F. T. Trouton, F.R.S.; "On the Reflection of Sound by Air Currents," by Prof. F. R. Watson; "On the Corpuscular Nature of Rays," by Prof. W. H. Bragg, F.R.S.; "On the Properties of the Radiation Producing Aurora Borealis," by Prof. L. Vegard; and "A Friction Permeameter," by Mr. W. H. F. Murdoch.

Associated Municipal Electrical Engineers (Greater London).—This Association held its annual general meeting at the Institution of Electrical Engineers on July 5, when the following executive officers were appointed for the Session 1911/1912. *President:* Mr. W. C. P. Tapper (Stepney); *Vice-Presidents:* Messrs. F. A. Bond (Battersea), L. L. Robinson (Hackney) and A. H. Shaw (Ilford); *Hon. Treasurer:* Mr. G. G. Bell (Hammersmith); *Hon. Auditors:* Messrs. J. G. Bruce (Willesden) and E. Calvert (Finchley); *Hon. Secretary:* Mr. N. Staniland (Hornsey); *Council:* Messrs. S. W. Baynes (St. Pancras), J. H. Bowden (Poplar); H. H. Couzens (West Ham), C. S. Davidson (Barnes), A. J. Fuller (Fulham), F. Hill (Hammersmith), W. Innes (Poplar), C. Newton Russell (Shoreditch), P. E. Rycroft (Heston), E. Sayer (Hampstead), A. H. Seabrook (St. Marylebone) and W. C. Ullmann (East Ham.)

EDUCATIONAL NOTICES.

University of Sheffield.—The faculty of applied science comprises the departments of engineering, metallurgy, coal mining and architecture. The courses in engineering or in metallurgy extend over three years and prepare respectively for the degree of B.Eng. or B.Met. of the university. The lecture courses commence on Oct. 4, and the technical laboratory courses on Sept. 18. Prospectuses and other particulars from the registrar, Mr. W. M. Gibbons.

University of Manchester.—Prospectuses giving full particulars of the lectures and laboratory courses in physics preparing for both the ordinary and honours degrees, will be forwarded on application to the Registrar.

City and Guilds Technical College.—This college provides a scientific training for students preparing to become electrical and mechanical engineers or chemists, and for engineering pupils who desire to supplement their practical training by a two years' course of instruction in the principles of engineering science. There are also arrangements for three-year courses in engineering. Particulars at the college, Leonard-street, City-road, London, E.C., or from the City and Guilds of London Institute, Gresham College, Basinghall-street, London, E.C.

In consequence of the rebuilding of Gresham College the head offices of the City and Guilds of London Institute have been removed temporarily to 3, St. Helen's-place, London, E.C.

University of Bristol.—Prospectuses and particulars of the faculties of arts, science, medicine and engineering (civil, mechanical, electrical and motor car) and of the secondary training department, day training colleges, evening classes, halls of residence, scholarships and bursaries will be sent on application to the registrar, Mr. James Rafter. The session in the faculty of engineering commences Sept. 15 and in faculties of arts, science and medicine on Oct. 2.

University of Durham.—Armstrong College, Newcastle-upon-Tyne.—The 1911-12 session commences Sept. 25. There are departments of mechanical, marine, civil and electrical engineering, naval architecture, mining, metallurgy, agriculture, pure science, arts and letters. Particulars may be obtained from the secretary, Mr. F. E. Pruen, M.A.

University of Birmingham.—The session commences Oct. 2. The full courses extend over four years and students who enter after matriculations and who pass successfully the examinations at the end of each year will be entitled to the degree of Bachelor of Science in the branch of engineering to which they devote themselves. The technical engineering classes are detailed, and a list of the professors, lecturers, &c., is given in an announcement on another page.

Northampton Polytechnic Institute, Clerkenwell, London.—The full day courses in the theory and practice of mechanical and electrical engineering, and in electro-chemistry will commence on Oct. 2, and entrance examinations will take place on Sept. 27 and 28, at which five entrance scholarships will be offered. The courses for mechanical and electrical engineering include periods spent in commercial workshops, and extend over four years, and they also prepare for the degree of B.Sc. in engineering at the University of London. There are also full and partial day courses in technical optics. Particulars from the Principal, Dr. R. Mullineux Walmsley.

University College, Nottingham, Engineering Department.—The College provides thorough courses of instruction (1) for the London University B.Sc. degree examinations in civil, mechanical and electrical engineering, and (2) for college and other diplomas in engineering and mining. The session begins Oct. 2. Prospectus from the Registrar.

Board of Education Grants.—A statement has been issued as to grants available from the Board of Education in aid of technology and professional work in universities in England and Wales.

The statement is prefaced by a memorandum of Sir R. L. Morant pointing out that the statement only applies to universities and to colleges forming constituent parts of universities and colleges in England and Wales. The day (but not evening) work of these institutions, with their post-graduate work (both evening and day), is thus removed from the purview of the Board's regulations for technical schools, &c.

ARRANGEMENTS FOR THE WEEK.

THE LONDON ELECTRICAL ENGINEERS.

Officer Commanding, Col. H. M. Leaf.

The following orders have been issued for the current week:—

Monday, July 31
Tuesday, August 1
Wednesday, August 2
Thursday, August 3
Friday, August 4
} Head Quarters will be open from 10 a.m. to 4 p

Saturday, August 5.—Falmouth Detachment (2nd Party) will par at Head Quarters at 8:30 a.m. Weymouth Detachment (2 Party) will parade at Head Quarters at 11 a.m. Dress for the sh Detachments will be:—Service Dress, Drill Order with Wat Bottles and Haversacks. Arms will be issued before each parade

NOTES ON TRAMWAY PROBLEMS.*

BY C. W. MALLINS.

(General Manager, Liverpool Corporation Tramways.)

After referring to the difficulties that have to be faced by a local authority or company before powers to construct a tramway in any given district can be obtained the author goes on to deal with the cost of construction. This cost shows an amazing variation when different districts are compared. Conditions, of course, vary in different localities; the writer is, however, acquainted with a number of undertakings where the conditions are similar, and are, therefore, to a considerable extent comparable, and yet an extraordinary variation exists. Figs. 1 and 2 show, diagrammatically, the cost of construction of permanent way and overhead equipment per mile of single track on 12 typical undertakings (which are numbered). The cost

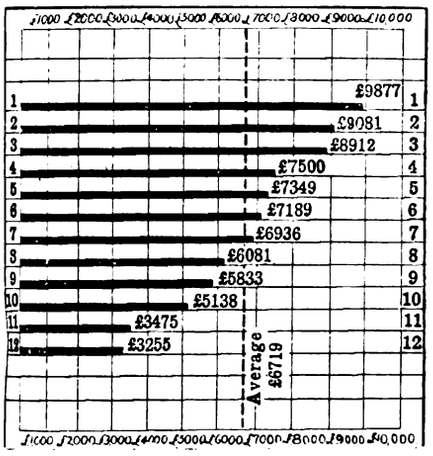

FIG. 1.—DIAGRAM SHOWING COMPARATIVE COST OF CONSTRUCTION OF TRACK PER MILE OF SINGLE LINE IN CONNECTION WITH VARIOUS TRAMWAY UNDERTAKINGS.

of maintenance of track is also a matter which deserves attention. Fig. 3 shows the cost of maintenance per mile of single track per annum on the same undertakings.

The question of road widening where tramways or light railways are about to be constructed has been found, in many cases, to present considerable difficulty, owing to the fact that some road authorities hold that, if tramways or light railways are to be constructed in public roads or streets which are not considered sufficiently wide, the cost of widening should be borne by the promoters. This is considered by most people to be unjust, and a real hardship, which should be abolished for the following reasons:—(1) It must be assumed that tramways and light railways are only constructed to meet a public

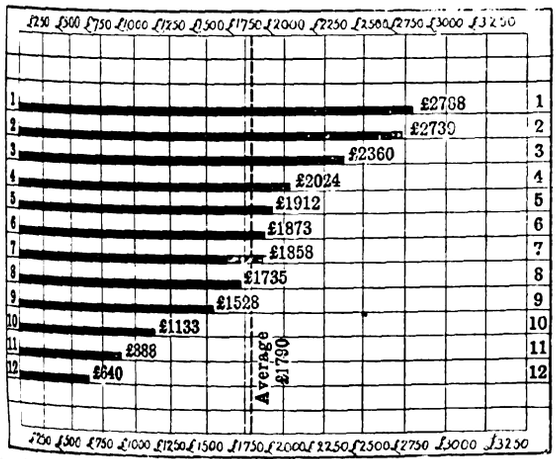

FIG. 2.—DIAGRAM SHOWING COMPARATIVE COST OF OVERHEAD CONSTRUCTION PER MILE OF SINGLE LINE IN CONNECTION WITH VARIOUS TRAMWAY UNDERTAKINGS.

requirement; therefore it becomes the duty of the road authorities to provide roads of sufficient width to deal with the volume of traffic of all descriptions using the road, including tramways and light railways. (2) Tramways and light railways are called upon to pay rates and taxes the same as any other user of the roads, and, therefore, should not be further penalised by being called upon to pay for road widening. (3) Tramways and light railways are compelled, under statutory obligation, to maintain the width of the two sets of rails, where double lines are in operation, and the space between, besides 18 in. outside the rails, which is undoubtedly a hardship, as this portion of the road is used by all other vehicles. In several places motor omnibuses are allowed to ply in competition with tramways or light railways, which have had to pay for road widening and maintenance of the portion of the road referred to, whilst the competing omnibus owners are not called upon to contribute anything. From these facts it will be apparent that an injustice is being done, and therefore some modification of the existing unfair conditions should be requested by all who are interested in the progress of the business.

The question of the best type of car for present-day requirements has often been discussed. Some persons advocate the bogey truck car, whilst others prefer the single truck. The claims of each have been pressed forward with equal vigour, but the writer is of opinion that, having regard to general experience in this country, the single truck car is undoubtedly the most suitable and economical for the following reasons: The carrying capacity of this type of car has now been so much increased as to make it possible, without much overcrowding, to get as many as 70 passengers on at one time, which is about as many as one conductor can reasonably attend to. Therefore, if the carrying capacity of the car is any greater, it is obvious that an assistant conductor would be necessary during the maximum hours of traffic, or otherwise a considerable percentage of the fares would be lost, which in either case would affect the financial result. The bogey car is certainly not the best type for dealing with the hours of minimum traffic, which we, unfortunately, have on most undertakings. It cannot be doubted, too, that the consumption of current on this type of car is greater than on the single-truck car, both during hours of maximum and minimum traffic. In addition, the maintenance of the car itself is heavier. For these reasons the single-truck

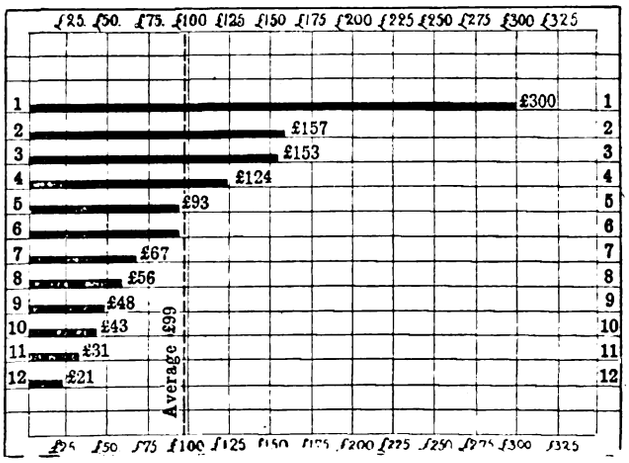

FIG. 3.—DIAGRAM SHOWING COMPARATIVE COST OF MAINTENANCE OF TRACK PER MILE OF SINGLE LINE IN CONNECTION WITH VARIOUS TRAMWAY UNDERTAKINGS.

car of the newer type, with 7 ft. 6 in., or 8 ft. wheel base, should be the car of the future for this country, as it has now been demonstrated that it is quite practicable to increase the length of the wheel base of single-truck cars without much disadvantage in operation. Two items of car equipment which are continually under criticism in courts of law are brakes and lifeguards, both of which have caused managers and engineers the greatest anxiety. Every conceivable improvement has been introduced in order to make these appliances as perfect as possible. It remains to be seen whether any further improvement can be made. If so, it would be welcomed by all.

The cost of current to undertakings which do not generate their own energy is a matter that deserves consideration, as the price charged varies so much that in some cases it means the difference between an undertaking proving remunerative or being worked at a loss. We know that the cost of production varies in different parts of the country, but not to such an extent as to justify the large disparity referred to; therefore, any expression of opinion by the Congress as to the correct charge that should be made for current would prove helpful to those who purchase current from other undertakings.

It need hardly be stated that it is the desire of all who are interested in tramways and light railways to give the best and cheapest travelling facilities possible to the public generally, and to the industrial classes in particular, consistent with business methods. That this has been accomplished on almost every system in the United Kingdom there can be no doubt, but the further demands which are being made by various sections of the public for cheaper fares is becoming one of the most serious problems in connection with management. Demands for preferential treatment to the working classes during certain hours of the day are continually being pressed forward,

*Abstract of a Paper read at the Congress of the Tramways and Light Railways Association at Edinburgh, July, 1911.

Digitized by Google

and when such concessions are granted to labourers and artisans, various other classes of the community, such as shop assistants, clerks, &c., demand similar treatment, and certainly with some show of reason, because, if it be conceded to another class who are equally well paid for their labour, their requests cannot reasonably be refused. In addition, there are agitations for free travelling for certain sections of the community, with the result that about 60 per cent. of the travelling public plead for preferential treatment, or free travelling, on many systems where the general rate of fares is already so exceedingly low that if a close examination were made it would be found that they were not in as sound a position as could be desired. It has now been discovered by certain undertakings which have given preferential treatment on a large scale to various sections of the public that a tremendous loss has resulted on that portion of their business, seriously endangering these undertakings. Hence, great care should be exercised and a firm attitude adopted by those responsible for the management, or disastrous results may ensue. The general public in addition to the preferential treatment referred to, expect long penny stages, with twopenny and other stages correspondingly extended. Demands have also been made from time to time for ½d. fares and transfer tickets, contracts, &c., all of which tend in one direction, *viz.*, to imperil the financial stability of the business. It is the opinion of most persons who are intimately acquainted with this subject that even on the largest systems operating in the great centres of population the longest distance a passenger can be carried for 1d. with remunerative results is a fraction under two miles, and the distance should be proportionately shorter on the smaller systems operating in sparsely populated districts. To fully appreciate the advantage which the general public derive from this cheap method of transit it is only necessary to make a comparison between the fares charged by the railway companies throughout the United Kingdom and those charged by tramways and light railways. It is well known that 1d. per mile third class is the usual charge made by railway companies, together with the granting of contracts and cheap excursions, but these latter concessions are amply compensated for by the higher rate charged to first and second-class passengers. Although the writer has no actual data, it may reasonably be assumed that the railway companies derive an all-round rate of 1d. per mile per passenger. If tramways and light railways charged the same rate of fare, instead of the total revenue per annum being £13,077,901 as at present, it would amount to £19,616,851.

From the foregoing it will be observed that tramways and light railways, apart from the preferential treatment referred to, are carrying the general public at very little more than half the fares charged by railway companies. Those responsible should, therefore, consider very carefully the financial result which a haphazard method of charging fares may bring about, especially having regard to the difficulty of some struggling undertakings, which are, unfortunately, operated at a loss, and others whose income merely covers operating and other expenses, or yield but very small returns to the proprietors. Railway companies have found it necessary to fix some general basis of charging, with the result that 1d. per mile third class appears to have adopted as their standard. If a similar basis could be adopted by tramway and light railway proprietors—not necessarily 1d. per mile—there is no doubt that good would result, and the public would not, on the whole, suffer, as it is surely beyond cavil that the passenger should pay for his ride just as he expects to pay for any other service rendered to him. Whether the undertaking belongs to a municipality or to a company it involves its owners in responsibilities; the municipality to its ratepayers as a whole, and not to any particular section; and the company to its shareholders. For these reasons the business should be conducted on sound financial lines. Through the courtesy of certain colleagues, the writer has been able to ascertain approximately the annual loss to 29 tramway and light railway undertakings in the United Kingdom, *viz.*, £165,000, caused by the granting of preferential treatment in various forms, and free travelling to certain sections of the community, together with the running of unremunerative cars to meet the requirements of the industrial classes. The amount of loss would, of course, be proportionately great if the whole of the tramways and light railways in the United Kingdom were included. Tramways and light railways have practically no source of revenue other than the extremely low fares collected from passengers, which leave but a slender margin of profit between the total income and the total charges. They are not in the same position as ordinary railways which derive a large revenue from the carriage of goods.

The transport of merchandise by tramways and light railways has on several occasions been discussed, yet nothing has been done to develop this class of business on anything like a large scale in this country. The time has, therefore, arrived when the matter might be seriously considered. It must be recognised that there are certain difficulties in the way, but these difficulties, in the opinion of the writer, are not at all unsurmountable. A large business might be developed in the carriage of goods without encroaching upon what has come to be regarded as the exclusive domain of the existing railways. Tramways and light railways might, with advantage, be utilised for the transit of goods between ship and warehouse, and railway and warehouse, and *vice versa*, in the large manufacturing and distributing centres where an enormous quantity of merchandise is stored in warehouses from time to time, most of which is conveyed to and from ship and railway by animal traction at the very heavy cost of about 1s. 9d. per mile. The cost by tramway need not exceed 1s. and this class of traffic could be carried on at night without causing obstruction during the day time. Tramways and light railways would prove an ideal method of dealing with agricultural produce in a way the railways cannot do and they would thus obtain a very welcome addition to their income.

TRANSFER FARES.*

BY C. W. SHEPHERD.
(General Manager Edinburgh and District Tramways Co.)

I may preface this Paper by saying at once that I am in favour of penny transfer tickets, as used in Edinburgh. The ideal service, from the passenger's point of view, would, of course, be one that would take him from anywhere to anywhere else on one car. In a complex system of city tramways it is, however, practically impossible, and at any rate unprofitable, to run a service of cars from any one terminal point to all other terminal points of the system, and passengers commencing their journey on a car which only takes them a part of the way they desire to travel find themselves of necessity compelled at a certain point of their journey to change into another car. When a passenger can get to his destination by one car, I am averse to allowing him the use of two cars for one fare. Where a change of cars has to be made, the question of the cost of the divided journey arises. If the passenger be required to pay the fare of each car—especially on a system such as we have in Edinburgh, where halfpenny fares are not in vogue—he will of a certainty complain of having to pay 2d. for a distance not more, and possibly less, than he would be entitled to on one direct-route car for 1d. It may therefore be admitted by the manager of a system where 1d. is the minimum fare, and who wishes to be fair and to encourage travelling, that a transfer ticket at the cost of 1d. is desirable under certain conditions or restrictions; otherwise business might be lost, and, as every tramway manager knows, a very small fraction of a penny per car-mile lost in earnings often means all the difference between profits and bankruptcy. I may as well state here that on systems such as Glasgow, where halfpenny fares are in operation, I do not consider transfer tickets necessary or desirable.

Assuming that transfer tickets are to be adopted, the conditions of their issue have to be considered. The public are to be reasonably provided with the benefit they desire, but at the same time the tramway manager has to take every precaution that the privilege is not abused and fraud perpetrated. With regard to the possible abuse of transfer tickets—and cases are bound to occur—I am not in favour of the exchange ticket system; that is, the conductor of the second car collecting from the passenger the transfer ticket issued on the first car, and giving in exchange therefor an ordinary ticket punched to his destination. This involves the conductor returning the collected transfer ticket as part of his drawings, and gives the ticket a cash value. Passengers might make a habit of asking for transfer tickets, although not requiring them, and a traffic in them might be carried on with the conductors, who could substitute them for cash extracted from their bag. The method I advocate is that one ticket—that is, the transfer ticket issued on the first car punched as to date and destination—should do for the divided journey, the conductor of the second car, after satisfying himself as to the correctness of the date and destination, defacing it by tearing a piece out opposite the destination punch hole.

I am aware that in America an outcry has been made by the street railway companies against transfer tickets because of their abuse by the public. It has, however, to be borne in mind that in America the fares are not graded as in Britain. The rule in America is a uniform fare for any distance, short or long, and as transfer distances are thus often of several miles length, a temptation, which many people seem unable to resist is created to demand transfer tickets, although not wanted, and to carry on an illicit traffic in them to the companies' great loss. As used in Edinburgh, the distance covered by a transfer ticket does not, as a rule, exceed half a mile by each of two cars, so that, with the checks used, there is little

* Abstract of a Paper read at the Congress of the Tramways and Light Railways Association at Edinburgh, July, 1911.

Digitized by Google

fear of malpractices. For some time we in Edinburgh indicated the hour within which a transfer ticket could be used. We still have printed on the ticket the words, "Good only for continuous journey on day of issue," but we have ceased to indicate the hour. We have done this in what I consider to be our own best interests.

A point about which there may be difference of opinion is whether the distance covered by a transfer ticket should be as great as that allowed for the same fare on one car. My opinion is that it should not. For example, if a penny ticket entitled a passenger to travel one and a half miles on one car, or, say, three half-mile stages, I would restrict the length of the 1d. transfer journey, except perhaps in a few special cases, to two half-mile stages—one by each car. One reason for this is that for the vast majority of journeys a direct service is available, and the provision of a full-distance transfer ticket could enable a passenger to break his journey on the way, make a call or transact business, and thereafter continue his journey, all for a penny, a thing which he could not do on a direct-service car. Another reason is that the company, having to provide two cars for him with their necessary staffs, the purchasing power of the passenger's penny should not be so great as when one car suffices to carry him.

In conclusion I am convinced that where transfers are judiciously placed they are remunerative to a tramway system, because it is an inducement to a passenger to take a penny transfer if he thinks he is getting good value for his money, even although in many cases the second portion of the journey is never completed.

THE ELECTRICAL EQUIPMENT OF THE S.S. "OLYMPIC" AND "TITANIC."

Summary.—In this article are described the various uses to which electricity is put on board the two latest White Star liners, the "Olympic" and "Titanic." These include, besides lighting, power for winches, cranes, fans, water-tight doors and stoking and helm indicators. The clocks and heating equipment are also electrically worked, while a complete telephone and wireless installation is to be found on board. The differences between marine and land practice are noted.

Introduction.

The tendency with Atlantic liners as with many other things has been towards increasing size. Ships which were considered monsters only a few years ago are now quite outclassed, and there seems no likelihood of the progress in this direction being checked yet a while. The latest ships to head the lists as regards size are the "Olympic" and "Titanic," the former of which made her maiden voyage from Southampton on June 14th last, while the latter will soon be completed. Both ships are products of Messrs. Harland & Wolff's famous yard at Belfast.

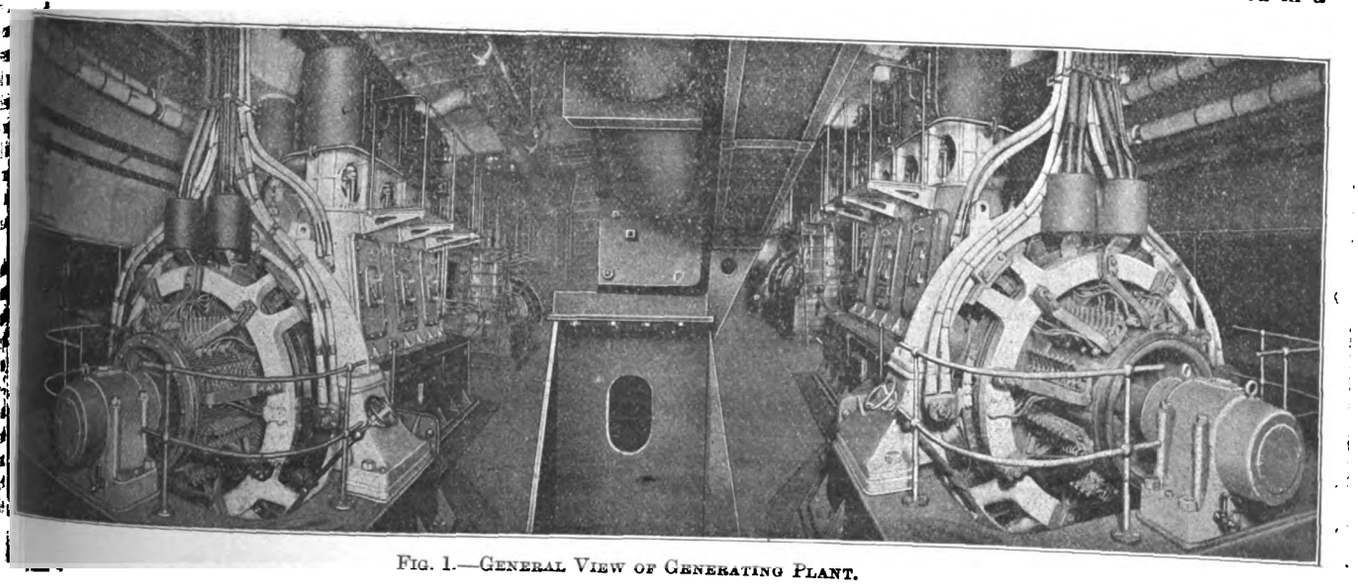

Fig. 1.—General View of Generating Plant.

Electricity is used in all departments of these mammoth ships, and before describing the large electrical installation in detail it will be of interest to the reader to enumerate the purposes to which electricity has been applied for power, quite apart from lighting. They are as follows:—Electric deck cranes, from 30 to 50 cwt.; cargo, boat and engine room winches; passenger elevators; stores, mail and pantry lifts; ventilating and stokehold fans; cabin fans; motors for cylinder lifting gear, turbine turning and lifting gear, and condenser sluice valves; pneumatic conveyor for Marconigrams; gymnastic apparatus; domestic machinery (such as ice rocker, dough mixers, potato peelers, roasters, knife cleaners, soup and sorbet machines, mincers); electric heaters and fires, hot plates, electric baths and irons; main steam whistles; sounding machines; stoking indicators; boiler room telegraphs; clocks; watertight doors; helm indicator; illuminated pictures and signs; chimes; bells; loud-speaking telephones and service telephones; submarine signalling; wireless telegraphy.

Generators.

The main generating plant, which is probably the largest electrical equipment that has been installed up to the present for marine work, consists of four 400 kw. engines and dynamos, manufactured by Messrs. W. H. Allen, Son & Co., of Bedford, and having a collective output of 16,000 amps. at 100 volts, thus exceeding in current capacity many electrical central stations. The sets are situated in a separate water-tight compartment aft of the turbine room at tank top level, their general disposition being as indicated in Fig. 2, one of the sets being illustrated in Fig. 3. The engines develop 580 B.H.P. each, and are of the vertical, three-crank, compound, forced lubrication type, running at 325 revs. per min., with one high-pressure cylinder 17 in. diameter, and two low-pressure cylinders each 20 in. diameter and 13 in. stroke. They are supplied with steam at 185 lb. pressure per sq. in., and exhaust either into a surface heater, when at sea, or to a condenser. Each engine is direct-coupled to a 10-pole compound-wound dynamo, fitted with interpoles.

The field magnets are of annealed cast steel of high permeability and are cast in halves, being divided on a horizontal plane. The ten main poles are cast in one piece with the yoke ring, and are fitted with laminated pole-shoes, the yoke ring being of specially rigid design. The interpoles are secured by

Digitized by Google

bolts to facings on the inner surface of the yoke ring. The series coils are of flat copper strip wound on edge, as are also the series coils of the commutating poles, and in all the windings great care has been taken to ensure ample ventilation, and also facilities for rapid disconnection and replacement of the different sections.

The armatures are of the slotted drum type, built up of mild steel plates on a cast-iron hub, the "former-wound" coils being of flat copper strip. The commutators having to deal with an exceptionally large current are of exceedingly massive construction, and great care has been exercised in the design to ensure only a moderate degree of heating. The brushes are of carbon and graphite, and while giving good conductivity also run with small friction on the commutator, thus preserving the surface of the latter in good condition for long periods.

Besides the four main generating sets there are also two 30 kw. sets, situated in a recess off the turbine room at saloon deck level, well above the water-line. These may be connected by means of a separate steam-pipe to boilers situated in one of several boiler rooms, and will be available for emergency in case the main sets should be put temporarily out of action; the general features of their design are very similar to the main sets, but the engines are of the two-crank compound type, and the dynamos are not fitted with commutating poles.

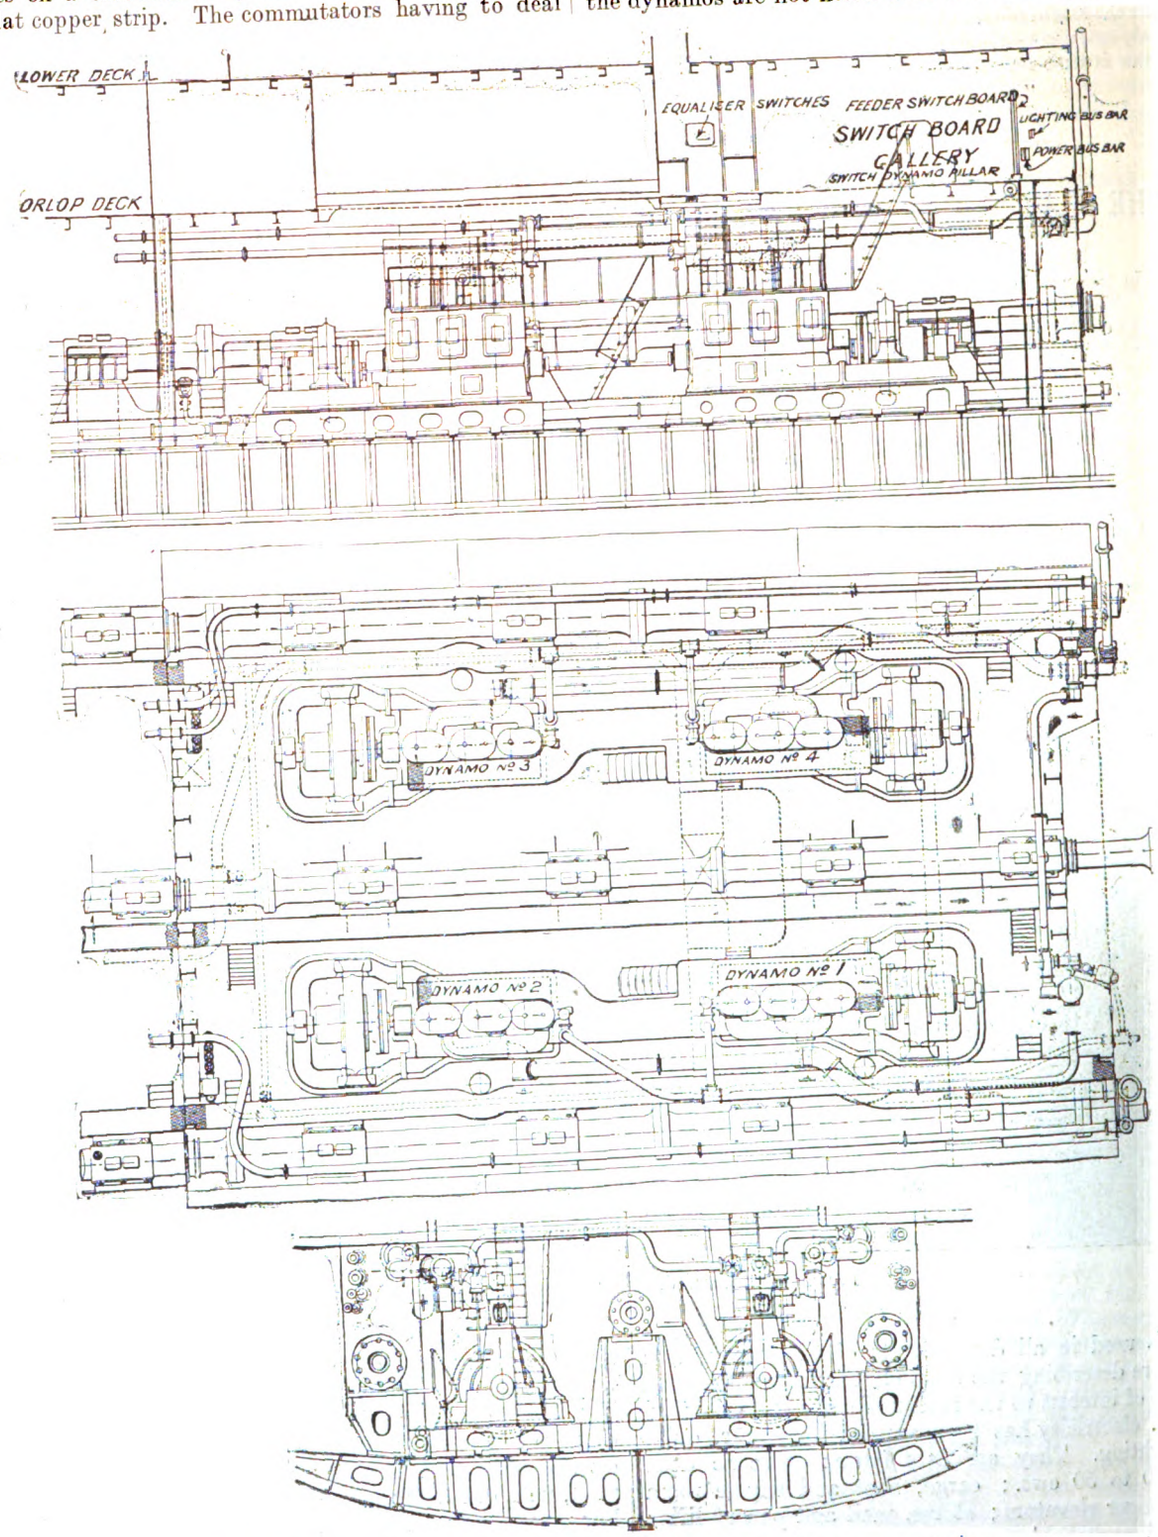

FIG. 2.—GENERAL ARRANGEMENT OF ELECTRIC GENERATING PLANT ON S.S. "OLYMPIC."

From Fig. 1, showing the general arrangement of the plant it will be seen that the four sets are arranged in pairs, one right-handed and one left-handed set, with the crankshafts in line and the stop valves inwards with a gangway passing between, and another pair immediately behind. It will also be noticed that the platform by which access is gained to the

Digitized by Google

cylinder covers, &c., extends right across the two units of one pair, the stairway being placed in the gangway between the two units.

Switchgear.

Current is conveyed from the main dynamos by means of heavy rubber insulated cables, each 1·5 sq. in. in section and 2¼ in. in diameter, to the dynamo control switches situated on the front of the switchboard gallery.

The main switchgear which is arranged on somewhat novel lines has been manufactured by Messrs. Dorman & Smith. Nearly all the gear is placed on an orlop deck across the forward end of the generator room. It consists of four sets of main switchgear, each set controlling one of the four main generators, combined with a set of four pairs of equalising switches, and also of a main feeder switchboard of 25 panels equipped with gear for controlling two circuits on each panel, making 50 circuits in all, each of 600 amps. capacity. All the main circuit breakers and switches are capable of continuously passing 6,000 amps. Each of these circuit breakers is capable of being operated by hand release or by a Ferranti overload control with an inverse time element equipment. In designing the circuit breakers, very careful attention has been given to the question of reliability. Every possible detail, such as the throw-out springs, trigger springs, cushion springs, auxiliary metallic and carbon breaks, &c., has been arranged in duplicate, so that the breakage of any one part cannot spoil the working efficiency of the breaker.

In series with each circuit breaker is the main instrument shunt, which is about twice the usual size to ensure a low temperature rise, and also a pair of main selector switches, permitting each generator to be connected to either the power or lighting 'bus bars, or to both.

All the main generator switches, shunts and connections are carried on steel bars, insulated with hard micanite. The supporting bars are in turn carried on a steel frame casting, and the whole gear for each machine is enclosed in a neat steel casing, supported on a cast frame.

Each set of main switchgear is operated by a row of five interlocked handle levers (*see* Fig. 4). The two outer handles

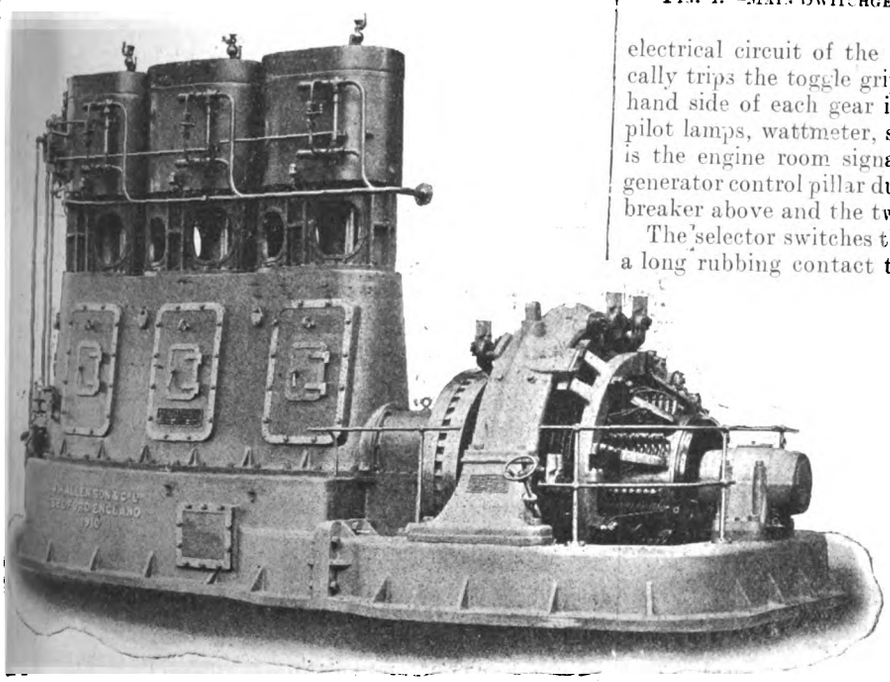

Fig. 3.—One of the Main Generating Sets, ss. "Olympic."

are connected mechanically with the lighting and power equalising switches, respectively, and are interlocked so that they must be closed before the next handles, which operate the lighting and power main 'bus-bar selector switches, can be worked. The central handle is for closing and gripping the circuit breaker, and is also interlocked with the selector switch handles, so that the circuit breaker can only be closed and gripped when the selector switches are both in the "off" position.

Fig. 4 shows the complete switchgear of dynamos Nos. 1 and 2. At the side of the casing are seen two devices for tripping the main circuit breaker; the top one closes the

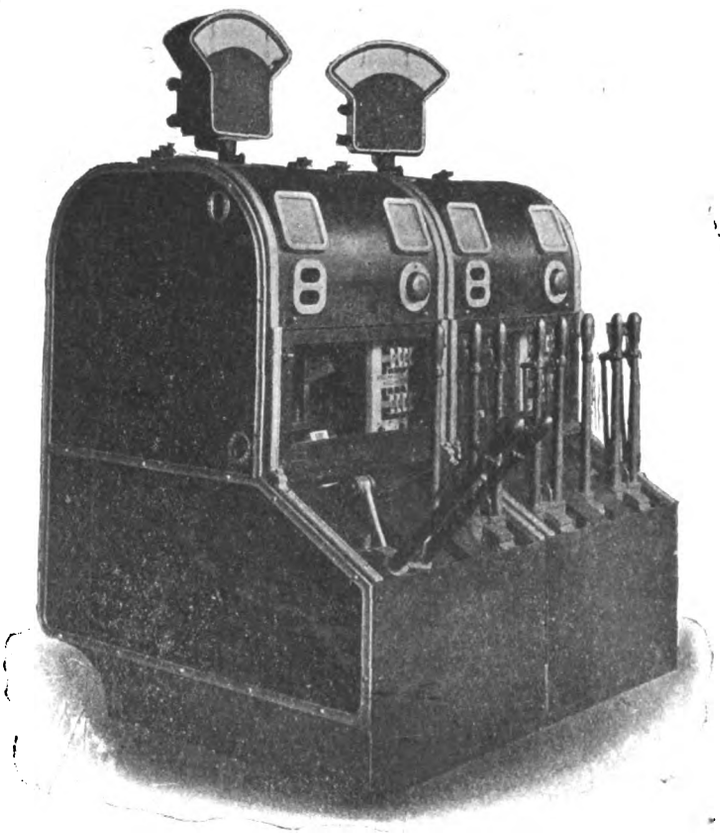

Fig. 4.—Main Switchgear of Dynamo No. 1 and Dynamo No. 2.

electrical circuit of the trip coil and the lower one mechanically trips the toggle grip and lifts the trigger. On the right-hand side of each gear is a small panel with the fuses of the pilot lamps, wattmeter, shunt, &c., On the upper right hand is the engine room signal knob. Fig. 5 is a view of a main generator control pillar during construction, showing the circuit breaker above and the two selector switches below.

The selector switches themselves are very massive, and have a long rubbing contact to avoid dirt being squeezed in under the contact faces. The section is 13·7 sq. in. and the contact surface 21 sq. in. The link connecting these switches to the operating lever handle is so arranged that no great effort is required on the part of the switchboard attendant.

Pilot lights are provided as follows: On any machine being excited the dial of the ammeter is illuminated; on closing a circuit breaker two pilot lights across the machine illuminate the inside of the casing containing the switchgear; on closing either a power or lighting selector switch two more pilot lights illuminate a bold sign at the back and front of the switchgear casing, intimating whether that machine is connected to the power or lighting 'bus bars.

The equalising switches called for very special consideration in their design. They are placed in the centre of the generator room and are as nearly as possible equidistant from the four machines. There is a power and a lighting equalising switch

Digitized by Google

for each machine, and these are mechanically operated from the switchgear deck by levers interlocked with the other main switchgear, so that no machine can be connected to a power or lighting 'bus bar until after its equalising switch is connected to the power or lighting equalising bar respectively.

These switches are very compactly constructed for such heavy gear, being identical with the main selector switches in capacity and construction. The contacts are combined with the equalising 'bus bar, so that the minimum amount of space is taken up; and the whole eight switches and two 'bus bars are carried on a massive steel frame, being insulated therefrom with micanite. This frame is arranged so that it is bolted and stayed to the ship construction work. A neat sheet steel casing to protect the switches is built round the eight switches and forms part of the steel foundation frame. A view of the equalising switchgear is given in Fig. 6. The enclosing case is arranged to open in two parts, the left-hand half being here shown open. The connecting links of some of the switches are shown on the right-hand side.

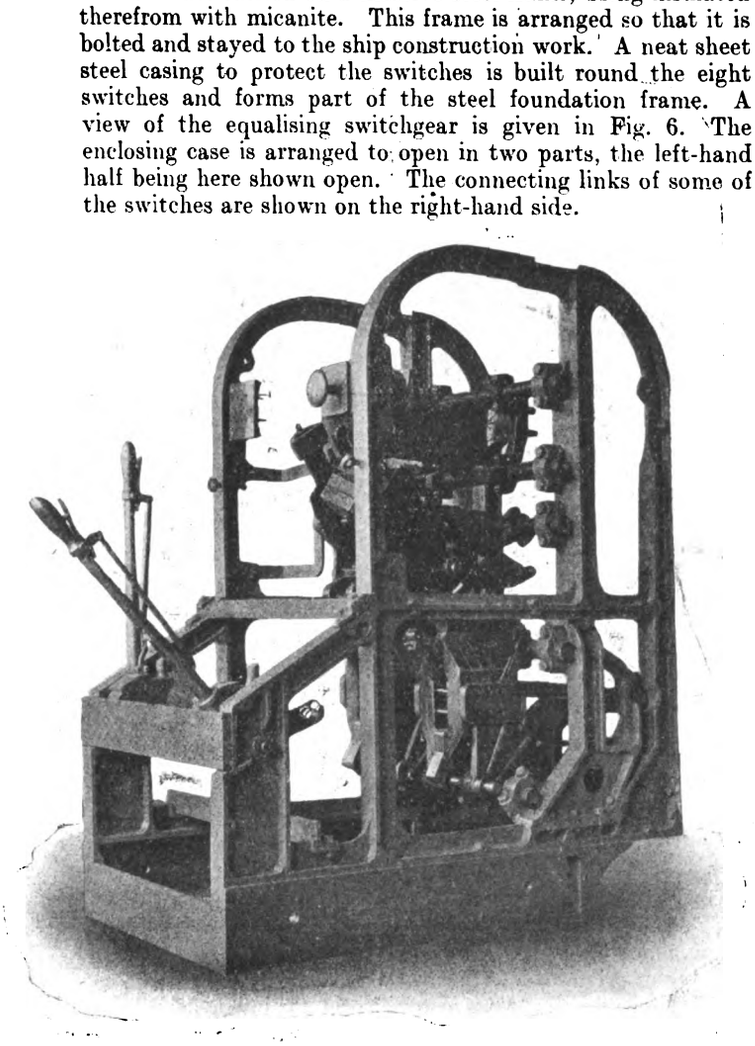

FIG. 5.—VIEW OF A MAIN GENERATOR CONTROL PILLAR DURING CONSTRUCTION.

The main voltmeters (Fig. 7), which are used also for paralleling, are carried on a cast-iron pillar amidships between the main dymamo control gear. The voltmeters themselves are mounted in pairs, each pair being arranged so that they can swing round through 220 deg.

The two outside instruments are used to give machine voltages and the two centre instruments 'bus bar voltages, the former being controlled from the plugging arrangements on the main dynamo panels, and the latter on the voltmeter pillar itself.

The voltmeter plugs are all three-pin and are fool-proof, so that machines cannot be put in parallel on to any one instrument. The third pin on each voltmeter plug is connected to the lamp circuit automatically illuminating a sign, so that the insertion of a voltmeter plug in any socket causes an indicator on the voltmeter pillar to be illuminated, intimating to the operator to what the voltmeter is connected.

Special attention has been paid to the transmitting of instructions from the switchgear deck to the engine attendant, and a signalling arrangement has been provided for this purpose. Placed in the centre of the engine room, where it can be easily seen and read from both sides, is an illuminated signal device. This can be operated from a control knob on each of the dynamo control gears. On turning the knob to the instruction required to be given, and pressing it, the corresponding sign is illuminated and a bell is rung, drawing the attendant's attention. The signs, reading "start," "raise speed," "lower speed" and "stop," combined with the number of the machine to which the signal applies, are visible in white letters on a red background when the lamps are illuminated by pressing a signal knob (Fig. 8).

SUPPLY SYSTEM.

From the main dynamo switches the current passes by insulated cables below the gallery to a massive feeder switchboard, which consists of 25 black polished slate panels for 50 separate circuits. Each circuit is controlled by a circuit-breaker and a large main "handle" type fuse. Each circuit has a moving coil ammeter, and each panel a pilot light bracket.

The main 'bus bars for the power circuit are of 8·4 sq. in. section, and for the lighting circuits 3 sq. in. section. The latter run the full length of the board, the power circuits being arranged on the centre panels, and the lighting circuits in two parts—at the port and starboard ends, respectively.

The main dynamo cable connections from the main selector switches are connected to the 'bus bars through massive copper connectors bolted up with steel clamps, and the surfaces of connection are spread along the central part of the 'bus bar, so that the current density is kept low.

From the feeder switchboard no fewer than 48 cables, ranging in size up to 61/12 S.W.G., radiate, passing vertically up

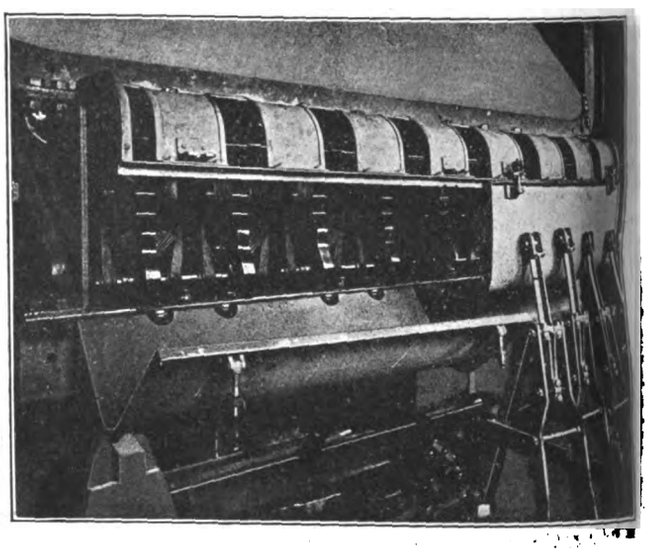

FIG. 6.—EQUALISING SWITCHGEAR.

two steel trunkways port and starboard and terminating in master fuse boxes on each deck, from whence branch the individual circuit cables. These ramify along the main passages of the different decks throughout the vessel and feed, in turn, distribution boxes. From these run branch cables supplying current to the individual lights, motors, heaters and other plant.

The system adopted is known as the single-wire, the returns being carried back, however, and bonded in such a way as to avoid stray currents. The power and heating can, if desired, be run entirely independently of the lighting, there being power and light 'bus bars on the switchboard, which can be paralleled if desired. The circuits are further so split up that passenger accommodation, saloons, crew, cargo, machinery spaces and individual motors or groups of motors, are independent, and can be switched on or off to suit the varying conditions when *en voyage* or in port. In addition, there are, of course, local switches in the cabins, and generally throughout the ship, for turning on or off individual lights or machines. The main cables and branch wires are of tinned copper covered with rubber and heavily braided, and in the machinery spaces are lead-sheathed, armoured and externally

Digitized by Google

braided. In the boiler rooms they are run in steel pipes for protection against damp and mechanical injury. Considerably more than 200 miles of cable have been employed.

Fans.

An idea of the large demand for power will have been gathered from the numerous types of electrically-driven machinery already cited. A large proportion of this is taken by the fans, which number 76, and include 12 for the stokeholds from 40 in. to 55 in. diameter, and 64 for the ventilation of the accommodation, including both suction and delivery, the latter in some cases supplying warm air. The aggregate current taken for ventilating purposes amounts to 5,250 amps. The fans themselves are of Sirocco type throughout, manufactured by Messrs. Davidson & Co., and are driven by Allen motors, which latter are designed in accordance with Harland & Wolff's specification, calling not only for hand control but also for automatic variation of speed to correspond with the par-

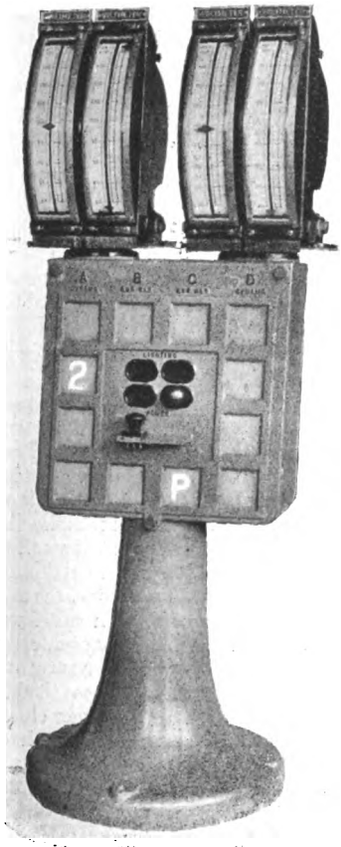

Fig. 7.—Main Voltmeter Pillar.

icular system of trunks to which the fans they actuate are nnected; this is very necessary, as, if running at a constant eed, they are liable either to be overloaded, or to fail to rise the demands made upon them as, owing to the varying conions, it is impracticable to determine beforehand the pre- e speed required for each fan.

The several stokeholds are supplied with air for boiler draught means of the electrically-driven Allen Sirocco fans menoned earlier.

Lighting.

The total number of incandescent lamps installed on board mounts to 10,000, of from 16 c.p. to 100 c.p., and for the most rt are of the latest Tantalum ship type. In the first-class ic rooms there are fitted sockets for electric portable mps or fans, and special dimming lamps with two filaments, that a light of small candle-power can be kept burning roughout the night, a feature which will appeal to nervous sengers. It may here be mentioned that in all passages, blic rooms, compartments and decks throughout the vessel e placed emergency electric lamps. These are on special circuits and derive current from the emergency dynamos previously referred to, so that in the untimely event of an entire extinction of the ordinary lighting, there would still be available illumination at all points where passengers and crew would congregate; in fact, anyone could find their way from one end of the vessel to the other lighted at night by this means.

Most of the electric light fittings in the passenger accommodation are of majolica, which does not tarnish like metal, and in the public apartments, main entrances and suite rooms the electric fittings are of a magnificent character, of style to suit the particular period of decoration employed, ranging from severe Italian Renaissance to elaborate Louis XVI. The main staircase fittings are after original French models, no pains or expense having been spared in their selection, some costing many hundred pounds apiece.

There are also a number of electric illuminated signs distributed through the first and second class accommodation, to direct passengers to the respective main entrances and public rooms, whilst on view in the gymnasium are attractive illuminated multi-coloured pictures of sections of the "Olympic" and "Titanic," and a map of the world with a network of the many White Star steamship routes, which circle the entire globe.

Lifts.

There are three passenger elevators at the forward first-class main entrance for conveying passengers between the upper and promenade and intervening decks. These are of Messrs.

Fig. 8.—Engine Room Signal from Switchboard.

Waygood's make, and accommodate 10 persons each. There is also an elevator in the second-class division running between the middle and boat decks. The necessity for these electric elevators will be apparent when it is recollected that the distance between the upper and lower decks served is 55 ft. The elevators are provided with interlocking safety gear, mechanical and electrical, of the most complete character, so as to ensure safety. The cages are guided by round turned steel runners, so as to give the smoothest possible movement. The controller is of their latest design for electric operation. It comprises a car switch in the cage and has a self-centring detachable handle. Special provisions are made to guard against overrunning in either direction in case of inattention on the part of the operator or any failure in the controller.

The other lifts are for the conveyance of stores, mail bags, and pantry supplies to the restaurant and officers' quarters; these are controlled by push buttons placed at the several entrance doors shown.

(To be concluded.)

CENTRAL POWER PLANTS AND ELECTRICITY SUPPLY FOR TRUNK LINE RAILROADS.*

BY F. DARLINGTON.

The author believes that when central station power supply is established on the larger scale to which it is surely growing, the best interests of all concerned, including the public, will be served by railroads buying electric power and keeping their railroad business distinct and separate from the business of generating and distributing power.

There is one essential to railroad work that must be met to the fullest extent before central stations can hope to succeed in the general supply of electricity for railroad motive power. The railroads must be assured of its continuity of service under all circumstances. This implies a degree of permanency and a simplicity of construction that has not been generally attained by power transmission companies, but it is possible of achievement, and will be amply justified by the very large installations which will be needed when railroad power is extensively supplied by central stations.

Comparative Costs.—Let us assume that as the capacity of a central station generating plant increases, the various things that enter into the cost of power are reduced by generating current on a large scale in such proportion that, while for plants of 50 kw. the labour cost may be about 0·37d. per kilowatt-hour, for plants of 5,000 kw. it is about one-half of this amount. For very large plants working at a good load factor we may assume that it is about one-fifth of this amount, or, say, 0·075d. per kilowatt-hour; and the very largest plants working at a good load factor have reduced the cost to about 0·037d. per kilowatt-hour. We may anticipate that the labour cost will eventually be reduced, under favourable conditions, to from 0·025d. to 0·035d. per kilowatt-hour. The cost of fuel is likewise rapidly reduced as advantage is taken of the generation of power in large quantities. A few of the largest stations report coal consumption as low as 2 lb. or 2½ lb. per kilowatt-hour. Likewise, in the matter of installation cost of generating plants and of transmission and distribution lines, increased size leads to reduced cost of construction. Many central station plants with relatively small units are to-day costing to construct £20, more or less, per kilowatt, while large plants have reduced their construction cost to the neighbourhood of £14 per kilowatt, with good prospects that in the future this cost will be reduced for very large installations to less than £10.

The production of power in very large quantities also almost always results in good load factors. In the transmission and distribution of power still more striking advantages are gained in large operations. It would ordinarily be unprofitable to transmit 1,000kw. 25 miles, for it would not pay to secure 25 miles of right-of-way and put up pole lines, &c.; but if the amount of power to be carried is much larger, say, 20,000 kw. or 30,000 kw. or more, the profitable distance for transmission may easily be 50 or 100 miles.

Thus, the economy of electric power from large generating plants as compared with isolated steam engine plants and other small sources of power is based on cheaper operation and maintenance of the large electric plants and not on a smaller first cost.

Railroad Motive Power.—By the nature of their service steam locomotives are tied down to pretty nearly all the conditions which are recognised as objectionable in stationary power generating plants. These conditions offer opportunity for central stations to furnish railroads with power and thus to widen the scope of their own profit and usefulness. On the other hand, electric locomotives can do other and better railroad work than can be performed with portable steam engines.

Much has been said about the very great cost of electric power on railroads, and the existing instances where electricity is used in heavy traction are referred to, to demonstrate this great cost, which is believed by many to be always greater with electric than with steam locomotives, and to be justified only where other questions than economy make electrification necessary. To instal an entirely new motive power system for a few miles of operation must always be disproportionately expensive. But under suitable conditions electrification of trunk line railroads is advisable in many places for purely economical reasons. I do not mean by this that to-day it is economical or would be economical to electrify all railroads. There are many places where the conditions are unfavourable for doing so, where the density of railroad traffic is small, where the distances to be covered by trolleys or third-rails are very great relative to the amount of power to be served. Up to the present time trunk line railroad power has only been furnished in one single instance—namely, the Detroit River tunnel of the Michigan Central Railroad. In every other case the railroads are making their own power for trunk line service.

I will point out two examples which seem to me to be the logical solution of the power problem for certain territories. One is in the State of Illinois and the other in Eastern Pennsylvania, including part of New Jersey. I do not propose these as exact descriptions of the most advisable developments, but as indications of general plans to be followed.

Illinois Power System.—In the State of Illinois, excluding Cook County, there will probably eventually be three or four power centres which will be located in coal mining districts. When the power business grows to its natural, most economical plan for generation and distribution, it is probable that three large central stations (or possibly more) will supply the State and will be connected together with high-tension transmission lines from which will extend branches and feeders to reach smaller outlying districts, and that this network will include and serve all of the power business for every kind of work in Illinois. The system of transmission lines and feeders will network the State in much the same manner that the State is now covered with railroad lines, excepting that there will probably be less diversity of ownership and less competition than there is among the railroads. The advantage of the central stations for serving power will be so great as compared with individual corporations and enterprises, that the latter will not be in a position to afford to generate their own power, because it will be cheaper to go to the central stations and buy power than to make it themselves.

I would here like to say that the larger and more comprehensive the power systems of the country become the more the public may be expected to demand governmental supervision of such systems. They will require the right of eminent domain, and this right will properly be granted to them in their capacity as public service companies. That they will be treated by our law makers as our common carriers are treated is reasonable to expect, and probably the same methods of regulation that are found successful to govern railroads in matters of competition, rate making, &c., will be applied to power companies. It may prove advisable that they should be subjected to some of the same restrictions that apply to railroads in the control rates charged, the prohibition of rebates, &c.

Eastern Pennsylvania Power System.—The second centre instanced which seems to the writer to constitute a natural power supply centre is the district of the anthracite coal mines of Eastern Pennsylvania. There is a very large consumption of power in mining, cement manufacturing, lighting, railroad work, &c., that is within short transmission distance or within a radius of 75 miles of these mines. This power can be better made in central stations than in the small units now in use, and if the locomotives on the railroads within the district are added to the central station service, the relative advantage of central station supply compared with small steam plants will be further enhanced. Such a centre may eventually extend its service with profit to include much power as far away as New York City and Philadelphia. The transmission distances would be about 90 to 120 miles, but if the transmission to the larger cities is done on a large scale it would be profitable as compared with the central stations now existing in the cities. It does not seem at the present time that the best economy in power service for New York and Philadelphia can be had by serving the power for the cities exclusively from central stations at the coal mines, but rather by installing very large transmission lines to Philadelphia and New York capable of carrying, say, one-third of the total amount of power now produced in the big steam central station plants in these cities. These transmission lines could be utilised to carry the base load or long-hour service of the central-station plants in the big cities, and the existing city plants could be depended upon to take care of the peak loads and shorter hour service at the times of heavy or so-called peak-load demand. In this way central station plants of approximately one-third the maximum power of the city peak-load could supply something like three-quarters the total kilowatt-hours used, and thereby cut the business of transporting coal for these large power plants to nearly one-quarter of what it would otherwise be. There is also a large amount of distributed power consumed in Newark, Jersey City, Trenton and intermediate points between New York and Philadelphia, and a vast amount of railroad motive power which could be supplied by electricity. Transmission lines installed between New York and Philadelphia could be made a sort of 'bus bar connection, tying the two city power supplies together, and thus utilising the space capacity in either city for reserve power when demanded in either city. At the same time these lines could be employed for the local distribution of power between the principal points, making the main arteries a triangular connection with one point at the coal mines, one point in New York City and one point in Philadelphia. Into this great transmission system any economical power supply could be fed.

* Abstract from the "Electric Railway Journal" of a Paper presented at the Convention of the National Electric Light Association.

REPORT ON PRIME MOVERS.*

BY THE COMMITTEE; I. E. MOULTROP, EDISON ELECTRIC ILLUMINATING CO., BOSTON, CHAIRMAN.

There were no important new developments in the field of power generation during the past year. The manufacturers of steam turbines have made a few minor improvements in design and construction which will affect the cost of maintenance more than efficiency of operation.

Balancing of Vertical Turbines.—The problem of securing a satisfactory running balance for Curtis vertical turbines was at one time a very serious one, but with experience in balancing it is now rare that trouble occurs due to serious vibration. The only rules laid down for balancing turbines appear to be, in general, "cut and try," balancing first the steam element and then later putting the field on the shaft and balancing the entire rotor. Examination of a large number of carefully kept records of balancing operations indicates that after the point of maximum eccentricity has been determined on the shaft the trial balance weight should be first applied at a point on the turbine 50 deg. away in the direction opposite to the direction of rotation.

Condenser Tube Troubles.—Troubles with condenser tubes, such as pitting, breaking, &c., are confined almost exclusively to those stations located on the sea coast and using salt water for the circulating medium. One large central station on the sea coast has reduced condenser tube troubles to a very nominal amount by using untinned Admiralty mixture tubes of most careful manufacture.

Some companies have reported that they are troubled with the condenser tubes creeping endwise, and in some instances the endwise movement of the tube has been sufficient to wear away the shoulder on the gland, and permit the tube to come out of the tube sheet. It would appear that this is caused by the high velocity of the steam entering the condenser, as the tubes which give trouble are those at the top of the condenser and receive the impact of the steam as it enters the condenser at a very high velocity. A suggested cure for this difficulty is to make a special gland for these tubes which will screw tight into the tube sheet, making a vacuum-tight joint without packing, with a groove on the inside of the gland next to the tube. The tube can then be rolled into the gland in a manner similar to the way a boiler tube is expanded in a boiler head. The other end of the tube may be packed in the ordinary manner.

Many central stations are so located that at certain seasons of the year the circulating water is very heavily laden with refuse and foreign matter of various kinds. The continuity of operation of the condenser then becomes a serious matter, as much of this refuse will pass through the usual screens, reach the tube sheets and clog up the tubes. One station has devised a remedy which is substantially an arrangement so that what was originally a multi-pass condenser is changed over to a single pass. The condensers were originally constructed for three-pass, and it was decided to cut away the first baffle, thus putting all the tubes in multiple with one another and making the condenser one-pass. When this change was made much less trouble was encountered by tubes stopping up. The tubes did become stopped up more or less, but with so many more tube ends exposed it took a much longer time to stop up a sufficient number of tubes seriously to affect the vacuum.

Cylinder Oil for Auxiliaries Using Superheated Steam.—Considerable diversity appears in the practice of different companies in the specifications for cylinder oil for this purpose. The viscosity reported varies from 145 to 240, and the flash from 531 to 660. One company reports oil compounded at 7½ per cent. of mineral oil, and another company no compounding at all. Prices reported range from 13·5d. to 20d. per gallon. The oils which should be avoided are those having an asphalt base, which tends to carbonise in the cylinders under the high temperatures.

Step Bearing Oil.—Although a few instances are reported where water is being used for step bearings, and with satisfaction, a light pure mineral oil is generally used for this purpose, and here again is found considerable diversity in specifications and price.

Feed-water Heating.—For heating feed water in steam turbine stations the general practice is to instal non-condensing steam-driven auxiliaries, and use the exhaust steam mainly in open heaters for heating the feed water. Quite a number of plants using open heaters report a feed-water temperature between 200°F. and 210°F., which is obtained without any other source of heating except that from the exhaust steam rejected by the auxiliaries. As a matter of fact, nearly all of the plants seem to have enough exhaust steam for heating the feed water, and only a few are making use of the expedient of taking a certain amount of steam from one of the intermediate stages of the turbine.

Ventilating Turbo-generators.—Most of the companies corresponded with have turbines of the enclosed self-ventilating type, and about one-half of them are taking fresh air from outside the buildings. None have installed any system of purifying the air, although in many instances the generator windings and ventilating slots rapidly accumulate a heavy coating of dirt, to the detriment of the machine. It would seem that a cheap and easily operated air-cleaning system would be of considerable value for many central stations.

A purification system about to be installed by one large company is located outside the turbine room, which contains four 12,000 kw. Curtis vertical turbines of the self-ventilating type, running at a speed of 750 revs. per min. and requiring 40,000 cubic ft. of air per minute each delivered at the inlet opening, or 160,000 cubic ft. of air per minute for the four units. After a careful study of the local conditions it was decided to place the air-cleaning equipment on the roof of the station, 70 ft. above the hoods of the units. The four units, which are located in a straight line on one side of the engine room on 20 ft. centres, have been connected to a common supply duct 8 ft. by 8 ft., of light sheet metal securely framed and supported on the wall 20 ft. distant from the units. The duct is carried through the north wall of the power station and rises vertically 70 ft. to the roof of the building, where the air cleaners are to be installed. Each unit is connected to the duct by a branch duct provided with self-closing damper. The main duct is provided in the engine room with a closed opening, which may be opened to admit air in severe weather to temper the cold air. The duct has been so designed that the velocity of the air in any part will be less than 2,500 ft. per minute, except at the inlet opening on the turbine, where the velocity becomes 2,700 ft. per minute.

One of the first propositions considered was a system of screens covered with a loose woven cloth, such as cheese cloth, but the screen area required to handle 160,000 cubic ft. of air per minute and the inefficiency of the cloth, together with the difficulty of keeping the screens clean, either with compressed air blown through the screens from the inside or a vacuum cleaner to remove the dirt from the face of the screen, caused the rejection of this type of cleaner at once.

A number of successful commercial systems of mechanical cleaning of air for ventilation of buildings by means of water spray for washing and cooling the air were investigated and found to be highly efficient and most satisfactory in removing dirt and soot and delivering clean cool air. Various makes were carefully examined, and it was decided that the straight spray system and a combination of the spray and sheet-cleaning surface were the two that offered sufficient merit for consideration.

The questions that are suggested in connection with the operation of an air washer are the danger of entrained water being carried through the eliminator; the regulation of the humidity in order that saturated air shall not enter the duct: also the degree of cooling of the air that may be reasonably expected in the summer and the protection against freezing of the water in the spray chamber in winter, and amount of steam required for tempering the coils. Large units have been successfully operated for years without the slightest trouble from entrained water being carried through, even in case of hard driving rains, when the velocity of the air passing through the eliminators has been increased several times. The humidity can be regulated so that there will never be an occasion for trouble from saturated air entering the turbines and depositing moisture.

The cost of a complete installation for thoroughly cleaning and cooling the air for large units will vary with local conditions, but the washer, eliminator, motor-driven circulating pump and housing should not exceed £160 for an equipment furnishing 40,000 cubic ft. of air per minute. For a 160,000 cubic ft. washer approximately 1,100 gallons of water per minute are required under ordinary weather conditions, which call for a 6 in. centrifugal pump, working under 12 lb. to 14 lb. pressure with a 15 H.P. motor. The amount of make-up water depends on the quantity of dirt and temperature of air, and cannot be estimated, though the total quantity should be small.

Large-sized Boiler Units.—Only one of the larger companies is seriously considering installing large-size boiler units. The Detroit Edison Co. has made an installion of some boilers, each having a capacity of 2,300 H.P. They are the largest single units reported up to date, and while they have not been in operation for any great length of time they are apparently quite successful.

The general tendency in building large plants is to provide for the possible installation of economisers at some future time, but they are not being generally installed at present.

CONFERENCE ON EDUCATION AND TRAINING OF ENGINEERS, 1911.

(*Concluded from page 587*).

Sections II. and III. held a joint meeting under the chairmanship of Mr. R. Elliott-Cooper. The following Papers, of which we give abstracts were read :—

THE RELATION OF PRACTICAL TRAINING TO COLLEGE STUDY.

BY PROF. A. BARR, D.Sc.

In defining the topics with which the conference is to deal the council has used the words "education" and "study" in referring to college work, and avoided the term "instruction" and the much-misused expression "technical training." This is as it should be. The end to be kept in view in a college course is the education of the student, and the result is to be measured not by the amount of detailed knowledge he has gained but by the extent to which his mind has been developed, and by the insight he has gained into the principles underlying successful practice. The alternatives before the colleges are : (*a*) The offering to the student in a limited time at his disposal of a general course of study that may form a basis for practice in any department of our wide profession ; or (*b*) the provision of a number of courses, from among which the student may select the one that appears to bear most directly on the particular branch he expects to follow.

If I may state my own view, it is that little specialisation should be attempted, if for no other reason than that the young engineer, if he has the elements of success in him, cannot foresee the trend his career will take. The best college course is the one that is most educational, and this will be the course that gives the student the broadest outlook upon his profession. It need deal little with the details of specialised practice ; these can best be learned in the workshop, the field or the drawing office. Men who are successful in engineering practice seldom follow in later life the particular branch of work in which they have been trained ; and of two men, one of whom has a thorough grasp of general principles and the other a knowledge only of the details of one branch—however intimate that knowledge may be—the former is in a much better position to take advantage of such opportunities of advancement as may come within his reach. Moreover, the conditions of practice, even in one limited sphere, are constantly changing. The college course should, then, be on broad lines, and should aim at giving the student a thorough grasp of general principles, illustrated by examples of their application in various branches of practice.

The question as to the order in which the two sections of the engineer's training should be pursued is also one that admits of no general answer. What will be best for one man may not suit another. Much depends upon the special circumstances of the pupil in regard to his mental qualities and attainments, the facilities he can command for study, and the opportunities he may have for securing practical training when he desires to enter upon it. Moreover, other things being equal, a man who has had a practical training is better able to benefit by a course of study in engineering science ; and, on the other hand, a man who has had a sound training in science is in a better position to take full advantage of his apprenticeship or pupilage. But he cannot have it both ways. In favour of taking the college course first, and pupilage or apprenticeship after graduation, it may be urged, with good reason, that by securing continuity in the pupil's education, the danger of his losing the habit of systematic study, and his grip of what he has already learned at school, is avoided. Further, he will enter on his practical training with his mind disciplined and developed by his study of science ; and experience comes most quickly and with most lasting effect to one who can place each item as it presents itself in its proper place in a connected system of knowledge based upon general laws the workings of which he has learned to recognise.

Further, if the college course is entered upon after practical training is completed, the pupil severs his connection with those under whom he has been trained, and he may have to make a fresh start in life when he leaves college.

In favour of practical training following directly after school, it is urged, also with good reason, that the initial stages at least of apprenticeship or pupilage should be got over at an early age. A man who has gone through a complete course of study in a university or technical college will necessarily have reached an age at which he may take less kindly than the schoolboy will to the drudgery of initiation into the routine of practice in the workshop or the office. Again, the man who takes his apprenticeship or pupilage first goes up to college with such a knowledge of his needs as will enable him to appreciate the value of what is offered for his assimilation. Furthermore, any lengthened course of study without the correcting influence of experience of the requirements and limitations imposed by the conditions of practice is liable to make a man altogether too "theoretical" in his outlook and his attitude of mind.

The disadvantages of postponing the college course to a late period in the pupil's training can be mitigated, to some extent, by private study, or by attendance upon evening classes, during the period of practical training—and good results follow in the case of men of special ability and perseverance—but the time and energy at the pupil's disposal for evening work are very limited compared with those he could command in a complete course of day study at a university or technical college.

There is then something to be said for, and something against, each of the alternatives discussed. But one branch of the pupil's training need not be postponed until the other has been completed—they may be taken on the "sandwich system." It is sometimes assumed that the advocates of the sandwich system commit themselves to a particular disposition of the slices of study and practice and to some definite quantitative relationship between their volumes. No hard-and-fast specification need be made. What is here meant is any arrangement which permits of college study being begun at a time not too distant from the close of the pupil's schooldays, which provides that during the later part of his studies the student will have the benefit of some measure of experience in the actual conditions of practice, and which ensures that the latter part of the pupil's practical training will be taken after he has had his mind disciplined by a course of study in pure and applied science. Whether a short period of practical work—a year or so—should immediately follow school, or, on the other hand, the first year course at college (in pure science) should come first, depends, in my opinion, upon the circumstances of each pupil as regards his state of preparation for higher studies and the facilities he can command for entering upon practical work when he desires to do so. I do not think any rule should be laid down.

Many objections have been raised to the sandwiching of study and practice. One is that the usual college session of eight or nine months leaves too thin slices of practice if the college course is taken in consecutive sessions. I agree with this view. When the system is adopted the college session should be limited to six months, as is done in some universities and colleges. Another objection is that engineering firms will not be disposed to take men on for half-yearly periods, with breaks of equal duration. Any pupil who finds it impossible to get entry to practical work on these lines must take his training in some other way, but hundreds of students do find openings that permit of thus sandwiching their trainings. The system is not new : it is indeed the oldest followed by university students of engineering science ; it has been adopted by generations of students since the Glasgow Chair of Engineering was founded in 1840, and my own experience, gained in the 40 years during which I have been connected with its working, has given me the firm conviction that it affords the best system of training for the great majority of men entering the profession.

In conclusion, I would plead that the engineering institutions should allow a wide latitude in the systems of training that they will recognise. Let it not be forgotten that no two of the men who have made our profession what it is have entered it by the same path, and that many of the most eminent of them have had no training that would to-day be recognised as a normal one, either in respect to education or to practice. Men differ in natural qualities as much as wood and stone and steel, and the tools and treatments that will fashion a useful product out of one may make a sorry job of it when applied to others. Let the system of training differ in different districts if need be, and let the courses of study offered by colleges vary in substance and in method. We cannot dictate to members of the profession the terms and conditions on which they will take apprentices or pupils, and it will be destructive of much that is best in the influence a teacher may have on his students if he is forced, by any detailed regulations, to work upon lines inconsistent with this bent and contrary to the dictates of his own experience. There is need in the profession for men of widely different qualifications : let us not aim at turning out our recruits like so many forgings stamped in one set of dies.

THE RELATION BETWEEN PRACTICAL TRAINING AND COLLEGE EDUCATION FOR ENGINEERS.

BY PROF. H. LOUIS, M.A., D.SC.

In the discussion of this question, it seems advisable to determine in the first place what are the points upon which there is practically a general agreement. All agree, I believe, that every engineer must have practical training, and though there may be still some who hold that when he has this all knowledge of theory is superfluous, I venture to say that no engineer of any eminence holds that view to-day

Digitized by Google

so that I shall commence with the assumption that training in both theory and practice is generally considered as indispensable to the engineer. As to the relative amounts of knowledge of either branch and the character of such knowledge there is a wide divergence of views. Possibly all will agree that there is nothing that has a greater influence upon the success of an engineer's career than the ability to deal with men. This is in many cases an innate ability, though it can undoubtedly be cultivated and developed. It is often said that one of the drawbacks of a college education is that it does not call out these traits of a young man's character, but in my opinion this charge is due to an imperfect appreciation of the scope of a college training. Mere attendance at lectures and laboratories will certainly not do much towards attaining this object, but it must be remembered that attendance at lectures and laboratories is only part of college life. In the relations between teachers and students, and still more in those among the students themselves, a British college forms one of the best schools in existence for teaching tact, good temper, honesty of purpose and that sportsmanlike sense of fair play, which form the best foundation for dealing with men of all classes. Participation in college societies, intellectual and athletic, as well as the large degree of self-government allowed to students' representative bodies, tend to foster a sense of order and responsibility, and to develop a power of administration which are of great value in after-life. Again, it has been sometimes urged that our colleges fall short in the matter of discipline; that in a works a young man will more readily acquire the all-important habits of punctuality and promptitude which in a college are not always inculcated with sufficient strictness. For this charge there may, I believe, be some foundation, but the defect is in no way essential to a college system; the remedy once pointed out is easy to apply, and I have every confidence that the importance of its application is becoming more and more generally recognised. Indeed, I think that it may fairly be argued that a college training is of quite as much value in the development of character as in the acquisition of knowledge.

There is no portion of the engineer's training upon which greater diversity of opinion exists than in respect of the manual training that should go towards making up the education of an engineer, and curiously enough this diversity is specially characteristic of the various branches of the engineering profession. Mechanical engineers, and to a lesser extent also electrical engineers, insist that a lengthy apprenticeship to the manual portion of the trade is indispensible, whereas the "civil" engineer looks upon it as wholly superfluous. The one insists that the pupil must learn how to use the hammer and the file, the other sees no reason why he should touch the shovel or the pick. For my part I cannot see why, if a man can build a bridge without being a skilled riveter, he must be a skilled fitter before he can build the engine that is to run over it. Still more curious is the anomaly in the two closely cognate branches of mining engineering; most metal-miners look upon practical acquaintance with the use of the miner's tools as an important part of the mining engineer's training, whilst the coal-miners hold that all such manual work is entirely unnecessary. Personally, I am inclined to think that this profound faith in the necessity of manual skill is to a great extent a piece of fetishism, a survival of the old apprenticeship system, which used to be the only avenue leading into any branch of the engineering profession. I will not go so far as to say that manual skill is useless to the engineer, but I am convinced that most of us rate it far too highly. It is pretty clear that the object cannot be the acquisition of manual dexterity for its own sake, but rather for the purpose of gaining familiarity with the properties and working of the materials which the student will have to employ for constructional work, though I should be hard put to it to explain why an architect should not be compelled to serve his time as a stone-cutter on precisely the same principle.

Where views as to the need for manual work diverge so widely, it is hopeless to attempt to lay down any rules generally applicable to the training in such work. This, however, does not apply to the whole of the subject of practical training, of which manual work is only one, and probably not the most important, part. If it be granted that actual technical experience amongst the men who are engaged in doing engineering work is essential, it will perhaps be fairly admitted also that the college is not the place to attempt to acquire such experience, and that any attempt to imitate works practice in a college is necessarily bound to result in failure. A college is the place to learn principles, and not practice. If this be admitted, it is not a very long step further to argue that the knowledge of principles ought to precede the study of their application, and that, therefore, college teaching should precede, and not follow, practical training. Whilst I hold this to be true, I also believe that many teachers will concur in my view that a moderate amount of practical training may be of use in the later stages of a college career, as giving more definiteness to the student's advanced work, and showing him more clearly the objective towards which his theoretical studies should be directed.

This is broadly the conclusion to which my experience is leading me. I do not find that the "sandwich system" in its true form—six months at college and six months in works—is satisfactory upon the whole, and think that it frequently results in both college work and practical work being badly done. On the other hand, after three or four years passed in the workshop, a young man usually finds it difficult to come back to his studies, and is not likely to make as good progress as if he had come to college straight from school. Of course, every teacher can quote numerous cases of highly successful students trained in one or other of these methods, but I am dealing here with average men and not with the more exceptional cases. I am inclined to think that the method now generally adopted for coal-mining students is one that embodies the soundest general principles: these students have often had a little experience of coal-mining or practical engineering of some kind before they come to college; they take a three years' college course, spending their long vacations at a colliery, where they are usually sent underground regularly with one of the officials, and thus get accustomed to seeing how work ought to be carried on, whilst they also spend a portion of their time in the drawing office and the colliery offices. After taking a college degree, the law insists that they shall have three years' practical experience underground before they are allowed to take the examination for a certificate as a colliery manager.

The above general system, suitably modified, would probably be applicable to all branches of engineering. Directly on leaving school, I would have the engineering student pass his matriculation examination, then go to a suitable works (using this word in its widest sense) for three to six months, then come to college for his three years' course, returning to the same or to a different works for some three months during each long vacation, and then finally serve a two or three years' apprenticeship. I think that any manual work is best done in the time between school and college. Many teachers will probably support my view that an engineering degree course should extend over four years instead of three as at present—a view which I have advocated for many years, and to which I find that general opinion is now gradually trending. Every branch of engineering has to-day assumed a high degree of complexity, and I do not think that seven years is too long a period to devote to the acquisition of the necessary technical knowledge, whilst I venture to think that this is best divided up in the manner I have indicated.

DISCUSSION.

Mr. H. ROLFE thought there was not enough of the commercial element in the training of students. Colleges dealt with the scientific point of view only, insufficient attention being given to such things as fine measurements, the using up of dies, and the avoidance of duplication in patterns.

Mr. W. B. WORTHINGTON (Derby) entirely agreed with Prof. Barr's last paragraph. It was absolutely impossible to lay down a hard-and-fast rule as to what was the best order of the college and practical training for every case. In his opinion it was best to take the college training before apprenticeship. A lad coming into his office was put on to structural steel work, so as to gain some practice in designing, and it was obviously better if the purely thoretical part of the college training had been obtained before he helped to make working drawings. He (the speaker) was assuming the lad had had a year in the workshop before going to the college. For the mechanical engineer the alternation was easier than for the strictly civil engineer. A year in mechanical works was self-contained, and could be broken off easily, whereas at the end of a year in the office a man had got into the swing of some work on which he was going out possibly, and if he then went to college for a year the thread would be lost, and he could not carry it forward so satisfactorily. Therefore, the sandwich system was not so applicable to the training of the civil engineer as it was to purely mechanical training.

Prof. THOS. TURNER (Birmingham) supported Prof. Barr's suggestion from another point of view. The question had been under discussion for many years, and no conclusion had been reached simply because the conditions varied so much. University students should have a certain amount of practical knowledge, so that they could understand what was being talked about; also a man going into the workshop should have a certain amount of theoretical knowledge so as to understand what was going on in the shops. The two kinds of knowledge should grow together. The ideal case was that which would be adopted by a man with a son to train, who owned works and also had plenty of money. There were many students of that character, and in such cases the whole of the vacation could if necessary be spent in the works. The sandwich system with three months' courses answered admirably. When the students met again it was very interesting for them to compare their experiences. A considerable amount of practical knowledge of the highest possible value was obtained in this way. There was no single road whereby practical knowledge could be obtained; so long as it was obtained they ought not to insist upon the particular method.

Sir ALEX. BINNIE (London) had not the slightest doubt that engineering education during the past 20 or 30 years had improved enormously. He was sorry to say, however, that the way in which students were pre-

Digitized by Google

pared at the colleges was not conducive to their advancement as civil engineers. The training in the colleges was such as to make them purely mechanics. His experience as one of the committee selecting civil engineers for the Indian service was that while many were fully qualified from the academic point of view they had little knowledge of civil engineering. The words prevalent during the conference were "workshop," "going into the workshop." That was not civil engineering; they should substitute "going out into the world." Young men came to him practically ignorant of the history of the profession. They were very good mechanics, they had been no doubt in the workshop, but of the broader views of the profession and the history of the profession they were totally ignorant. Their minds were not wide, and they were not fit to be civil engineers. As to what the education should be it was not for him to point out: he was only telling them the results. The education should be broad and wide in scientific matters and in what the old colleges and universities would call natural philosophy. He wanted to see men intending to be civil engineers understand geology, surveying and the outdoor use of instruments. Let a man go to a college and gain the largest and widest experience he could in that college before he attempted to commence his practical course. Practical work in the workshop was exceedingly useful, but not absolutely necessary. Riveting was very useful and necessary, but it was not necessary that a young man should go into a shop and be a riveter. Sufficient learning to know when the riveting was well done or not well done could be acquired in very short time. Knowledge of actual masonry construction and earth-work was very important for civil engineers. The young men should study the works of their predecessors. They should visit many of the suspension bridges. They should read up the subject. They should study the Britannia Bridge, and see how Stevenson and Fairbairn had solved problems which met with success, also the Saltash Bridge, and there study the work of Brunel. They should also study the last masonry dams erected in this country. By studying the work of the masters of their profession they would themselves be seized with an enthusiasm for their work which could not be inculcated in any other way.

Sir FRANCIS RAEBURN said when they came to the question of the training of the ordinary constructional engineer he could not help thinking there was not time for all of them to go through the mechanical course. What was required was a good general education. They should not specialise. The larger part of them required university training, but whether they could take seven years over it, as Prof. Louis desired, was doubtful. There were advantages in going through the workshops for a short time, but everyone could not afford the time. He would not go so far as to rule it out entirely.

The three Papers, of which we give an abstract below, were taken as read, by agreement with the writers.

WORKSHOP TRAINING AS A PRELIMINARY TO OTHER TRAINING IN ENGINEERING.

BY J. ALEX. BRODIE, M.ENG.

In introducing this subject I have thought it well to assume that the youth about to take up engineering as a profession is of average ability and circumstances, about 17 years of age, that he has had a good general education, a superior mathematical training, and preferably an experimental knowledge of one science subject. He should also have been trained to think for himself, to express his views clearly and concisely in speech, and to report in writing on any matter which may be put before him. If he has been accustomed to act as schoolboy captain or to work to the orders of his captain in sports and athletics so much the better; and he should be encouraged to keep up his connection with healthy outdoor sports.

By some it is thought that training in school and college workshops is of considerable value, and whilst this is, no doubt, better than no training in workshops at all, I take the view that workshop practice, to be of real value to the engineer who proposes to advance in his profession, must be conducted under commercial workshop conditions in which considerations of time, money, discipline, organisation and enterprise are factors of importance.

At the age named, the youth should have sufficient strength of character and physique to take care of himself in the workshop atmosphere, and he is yet sufficiently young to adapt himself to the dirty conditions of work, the muscular exertion, and the somewhat rough-and-ready manners of the workmen with whom he must learn to work on a friendly footing if he is to obtain their help and assistance.

Probably all experienced engineers are to-day agreed that a period of practical training both in shops or works and drawing-office is of undoubted advantage to the engineer, much increasing the value of his services as an assistant, and adding to the weight of his advice and opinion at a later stage in his career. Important points for consideration are: (1) The class of workshop he should enter; (2) the class of work most likely to be helpful in his future career; and (3) the length of time which can be given to works and drawing-office training.

As the result of experience I am firmly convinced that the best type of workshop is one in which the materials used and the classes of work done should be as varied as possible. If repair and maintenance work is done so much the better. It will generally be found that in a comparatively small works the youth's ability will be more fully utilised, the necessity for quickness and accuracy more quickly brought home to him, and he will also have the advantage of being more directly under the eye of the master.

As against this view, it is often considered that training with a well-known firm more than counterbalances the advantages obtainable in a small general workshop, and it must be admitted that training in a great works, especially if followed by a pupilage or subsequent experience in one of the best offices, is still looked upon as a good introduction to the profession, particularly for those desirous of taking up work of a public character.

For the youth who does not propose to remain in the workshop it is not, I think, so necessary that he should learn to equal the workman in his knowledge and ability to execute any one class of work as that he should acquire an intelligent knowledge of the processes and methods of treatment of the various metals and other engineering materials. Perhaps of greater importance than anything else is the ability to form a correct opinion of the capability of the men in a workshop, a knowledge of their methods of thought and work, a study of the systems adopted to get work pushed through to completion, and generally such knowledge as will enable him to handle men advantageously when occasion requires.

The importance of obtaining some practical experience in a works' drawing-office should on no account be overlooked, as efficiency and speed as a draughtsman, combined with some ability to design, has been the first step in the rise of many men who have advanced to the higher positions in the profession.

It should also not be forgotten that the young engineer may at any time be called upon to proceed abroad to take charge of works under conditions wholly unknown in this country, and, speaking from my own experience, I can say that the knowledge of workshop practice in materials such as the metals, wood, stone and cement, together with drawing-office experience, have been of the greatest assistance in settling points of importance when away from the experienced and helpful friends who are generally available for consultation in this country.

With regard to the period of time which should be given to practical work at this stage in the young engineer's career, I would, wherever possible, allow for three years in works and drawing-office, especially if, as in many cases, it is necessary or desirable that the youth should, on the completion of the additional period of study, desire to get a start in an office or works in this country. It is my experience that a youth with three years' practical workshop training as a preliminary to his college education would have much less difficulty in getting a useful start in the profession than the youth who only had a college training. In the one case, having obtained his degree, he is probably well worth starting at once on a small salary and should pay his way on any class of work. In the other case, a considerable time will usually elapse before he settles down to real work, and it does occasionally happen that the University man's estimate of his own value as an assistant is not reached in practice for a considerable period.

What I understand to be the practical objection raised to the acquisition of practical experience before taking a college course is that young engineers are generally unable to keep up their ability to study or to improve their technical education during the practical training in workshops. I number amongst my friends a large number of men who obtained most of their theoretical training whilst working the full workshop and drawing-office hours at a time when the facilities for acquiring such knowledge were not by any means so general as they are to-day. I have consequently little sympathy with young engineers who cannot do so, or with those who think it necessary that young engineers should work a reduced number of hours in the workshop so that they may be able to give greater time to study and to improve their theoretical work. It used to be, and is, I believe, still, the almost universal workshop practice, not to give important work to short-time men, and, therefore, a youth working short time is seriously handicapped in obtaining practical experience of value.

Short hours should not be allowed as a general practice, and though it may be a good thing to allow additional time for study, this should be within the works or under some form of control. I am aware of many cases in which these well-intentioned allowances of time for study have been abused, and I believe that even after a day's hard muscular work mental training may with advantage be continued, especially during the winter months, when little in the nature of healthy outdoor exercise is possible.

It appears probable that if our youths of to-day cannot or will not stand the strain of the severe training which has in the past given good results, they will probably have to take a position behind those who are prepared to do so. It may on the whole be better that they should take up work better suited to somewhat easy-going methods, and it cannot be doubted that there are many lines of life in which

Digitized by Google

young men can more easily and quickly acquire both money and position than in the engineering profession. Even with hard work, deep thought, foresight, organising power, a clear grasp of the situation, determination, and strong common sense, success in engineering is not always assured.

WORKSHOP TRAINING AS A PRELIMINARY TO PRACTICAL TRAINING IN VARIOUS BRANCHES OF ENGINEERING.

BY J. M. MONCRIEFF.

It will be of use to consider this question in the following form: What ought the student to learn during such a period of workshop training, and how does the knowledge to be gained during this period bear upon subsequent practical work in other branches of engineering than those concerned with the construction of machinery?

In dealing with this question it is only possible to touch upon some of the more important points in an introduction to a discussion.

1. The student will, or ought to, learn the value of discipline and the necessity of order, punctuality and continuity in work.

2. He will acquire a personal knowledge of the various materials used in the manufacture of machinery. This personal knowledge is entirely different from anything which can be obtained by any amount of reading or laboratory work. He will actually feel the materials as he works with them, and his knowledge, not only of what *can* be done, but of what can *reasonably* be done with them, will be greatly extended.

3. He will learn the use of hand and machine tools, and how much ought reasonably to be done *in a given time* with their aid under ordinary commercial working conditions.

4. He will see the order in and foresight with which work is distributed throughout the shops so as to ensure that the whole, though composed of innumerable units, shall all work to one common end with due regard to economy.

5. By working at the vice, the lathe, the pattern-maker's bench, in the smithy, in the foundry, or in the boiler shop or bridge yard, he will learn the various processes through which work passes, and he should become imbued not only with the scientific side, but, at this stage, still more importantly with the commercial side of engineering work.

6. By working side by side with workmen he will have the opportunity of studying their characters and modes of thought. The influence of an engineer who has had such personal contact is immeasurably superior to that of one who has merely had a bowing acquaintance with labour. The value of such personal contact is not confined to influence over workmen; it extends to subsequent business life when dealing with experienced engineers, whether consulting or manufacturing, and especially the latter, who, not seldom, make the criticism that such and such an engineer "has no real practical knowledge of the work. He is merely a paper man."

7. The student in the works should also begin to learn some of the limitations of the application of science to practical work. It is, or ought to be, common knowledge that that which on the surface appears scientifically desirable may be practically foolish and wasteful both of time and money.

8. If the student's mind be of true engineering bent he will unconsciously acquire a knowledge of the relative proportions of details of machinery and structure, and his eye and mind will be trained by the daily study of work which embodies the accumulated experience and extended study of others who are preceding him in the same walk of life.

9. A period of training in the practical side of mechanical engineering will impress on the student the great importance of accuracy.

10. By working actually at vice or bench or machine in a dividend-earning concern, the student is brought into personal touch with the money-value of time, labour and plant, and is forced to realise that without full recognition of such money-value success in everyday life will not be attained.

11. A thorough grounding in all this valuable experience and knowledge is to be gained within the gates of a mechanical or structural engineering concern, and all within an area of comparatively limited extent. No subsequent training on large works of construction can so fully and quickly and efficiently supply all the desiderata of training which has been outlined above.

12. What important engineering work was ever carried out without the use of mechanical appliances?

13. Further, what can be expected of a designer of machinery, ships, bridges, structural steel and ironwork, waterworks, gas works, electric plant or any other of the varied productions of engineering, if he has had no mechanical training? The answer may be given in the words of a works manager, who criticised the design of some of the details of dock gates which his firm were carrying out to a consulting engineer's designs, as follows: "The work might almost as well have been made of solid silver."

WORKSHOP TRAINING AS A PRELIMINARY TO PRACTICAL TRAINING IN ALL BRANCHES OF ENGINEERING.

BY PROF. J. J. WELCH, M.SC.

Since 1867 much has been done to emphasise the need of proper scientific training, and few will be found to question the wisdom of the council of this Institution in insisting upon a high standard of theoretical knowledge in those desiring membership. Also, and to at least an equal degree, their emphasis upon the need of practical training commands approval. The desirability and feasibility of preliminary workshop training are the subjects which it is desired to open up for discussion by means of this note.

In considering the latter subject the point of view of the employer must always be borne in mind, for, however desirable the training may be, it is the employer alone who can make it possible; and whole-hearted co-operation between the employer and the engineering colleges is essential if the best results are to be obtained, and if the course recommended by the Committee is to be generally adopted in practice.

In attempting to appraise the value of this preliminary training, it seems convenient to consider separately the case of those students who intend following up what may be summarised as general mechanical engineering, and those who intend to devote themselves to branches of engineering in which machinery is not so extensively employed. Dealing with the former case first, the student may, immediately after the period of preliminary training, desire to take up his college work, or he may continue his practical training in an office. In each case he would find the introductory workshop course helpful. Most colleges provide a course of study during the first year which is common to all sections of engineering, and the lectures on, say, applied mechanics are more easily comprehended by those students who have seen at close quarters, and handled, the machines and details taken for the illustration of the principles. It goes without saying that these students find one great advantage of the early training in the ease with which they can understand the allusions to technical details in the specialised courses.

If, on the other hand, the student after his preliminary course goes into an office, he will, in all probability, be early introduced to specifications of work, and here again he will find his early experience useful in understanding the terms used. Or he may be employed drawing out details and fixing sizes, and his work at the shop will enable him to appreciate dimensions and proportions much better than he could hope to do without that experience.

Further, the lad who enters the works at a comparatively early age gets into closer contact with the workman, and the workman seems more willing to teach him at that stage than after the college period is passed. This close association in the works enables the student to gain the point of view of the artisan, a point of some importance to those who may subsequently be placed in charge of men. Then, again, this immersion into a commercial atmosphere immediately after leaving school comes as a pleasant break in his scholastic studies, introduces him to new interests, and enormously widens his outlook by the time he is called upon to take up his college work; and he does so with a better appreciation of the goal towards which he is tending than is possible to one without such preliminary training. It should, perhaps, be added that this early workshop experience is occasionally useful in convincing some young men who thought of taking up engineering as a profession that they have mistaken their vocation; and they have been able to select some more congenial sphere without any important loss of time. The discovery of unfitness would probably not have been made so early had the college training been taken first.

For all these reasons, then, it is considered that an introductory workshop course for those intended for the general mechanical engineering profession is of distinct importance; and it is significant that a similar course is now insisted on for German shipbuilders and engineers before taking their theoretical course at a high school, although formerly students were allowed to get their high-school training without such practical experience.

The length of training recommended by the Committee of this Institution seems adequately to meet all requirements; and it has been found that periods very materially in excess of one year, interposed between school and college, tend to make it difficult for the student to pick up again the threads of his interrupted mathematical and other theoretical studies.

Considering next the case of "civil" engineers and others not so closely associated with the design and care of machinery, one speaks here with some diffidence on account of less intimate knowledge of all the conditions; but, remembering the increasing use of plant and machinery of all kinds in all branches of engineering, it seems that in this case also a preliminary workshop training must be of very distinct use, and it will be obvious, without special reiteration,

Digitized by Google

that some of the advantages claimed above are equally relevant to the "civil" engineer. The preliminary course could be somewhat shortened, however, as compared with that for the mechanical engineer, and from six to nine months would furnish all the experience needed.

DISCUSSION.

Prof. J. M. MONCRIEFF (Newcastle-on-Tyne) said that young men had the impression that when they had completed their college career they could look forward to employment. College authorities should not allow them to have this idea. Getting a degree was not work; they must get some practical knowledge. Young fellows could not be taken into the office straight from the college. There was, so far as he was aware, no commercial feeling behind the teaching in the universities.

Mr. G. G. STONEY (Newcastle-on-Tyne) said the importance of preliminary work in the workshop was in weeding out wasters. They were not all engineers. In his mechanical and electrical works they had some 250 apprentices, and allowed as many as possible to go to college and come back. About half a dozen were away at a time. Of course, if all of them took such privilege they would not be able to allow it.

Mr. C. W. DARLEY (London) said it was a good thing for young men to get into the contractor's office as a contractor's engineer, and learn something of the practical carrying-out of large works, also of keeping accounts of the cost of works. They should have three or four years' practical training in England before going abroad.

Mr. R. J. G. READ (London) said in regard to civil engineering it was a great advantage for a boy to go into the civil engineer's office for a short time before going into the works. The boy should also have some college training before going into the office, and it would not then be necessary for him to be articled for so long as used to be the case.

The CHAIRMAN (Mr. R. Elliott-Cooper), in concluding the discussion, said if they all had to be experienced in all things life would not be long enough. However advisable it might be for a young engineer to be equipped with every possible advantage it was impossible to give him that detailed instruction and practice which some speakers had suggested. There was not time to become a mechanic if they had to work up the subjects necessary for a civil engineer. For the civil engineer who was going to devote his career to the construction of railways, harbours, docks, waterworks, municipal works and the like, mechanical knowledge only came in as an incident in the general practice. In regard to engineers going abroad, general engineering knowledge, a thorough scientific knowledge to commence with and a thorough English technical knowledge fitted a man for any work no matter in what part of the world he might be. The knowledge which an engineer got with a contractor was most valuable. In no engineer's office could be got that knowledge to deal with money and money values better than in the contractor's office. Several had spoken both for and against the sandwich system. He thought the college career ought to be taken before the practical career. It was practically impossible for a young engineer going into the civil-engineering branch of the profession so to dovetail the work from the college to the works and from the works back again to the college as really to enable him to gain any continuous knowledge either of the one or the other. The object of scientific education was to teach the natural philosophy which was to be put into practice later on in life. He did not go so far as to say that some practical training might not be sandwiched in.

The sectional meetings being concluded, the Conference then assembled in the Lecture Theatre, with the President in the chair.

Mr. A. F. YARROW said he did not propose the following as a resolution, but before the closing of the Conference he submitted that the Council might be asked, with advantage, to focus its attention upon the following points, which he had placed in the form of resolutions: (1) That the Council of the Institution be desired to use its influence in any way deemed practicable to secure a continuity of study between those public schools where the elements of science are taught and the universities and technical colleges, so that pupils leaving such public schools be suitably trained to follow at once a college course with advantage, so that, as it were, the college course may begin where the school training finished. (2) That with a view to facilitate the above, a closer connection between the masters who teach science in public schools and the Institution of Civil Engineers is desirable. (3) That the Council of the Institution should endeavour to induce the universities and technical colleges to adopt such terms of study, say, six months during the winter, so that the "sandwich system" can be adopted, if desired, which is not possible with the terms now customary. (4) That it is desirable that the Council should endeavour to produce some co-ordination between the college and the employers, by making a systematic inquiry from the employers as to the condition under which exceptional students properly qualified may be able to get practical training for a period of, say, 24 to 36 months on the "sandwich system" or not, when vacancies in such establishments occur.

Mr. ALEX. SIEMENS said that some teachers were at a loss as to what to prepare their students for. They had evidently forgotten the conference about six years ago to which the Institution had sent delegates. The conference was called by the Board of Education for the purpose of laying down the syllabus of a standard examination which should be accepted by the universities as an entrance examination, and also by the various professions. That came to nothing because the schoolmasters could not agree what the syllabus should be. He did not know whether it would not now be the time to try once more. He was encouraged in that idea because just now a conference of surveyors of the whole Empire was sitting, their object being to see whether surveyors could not be made interchangeable, as it were, between the various dominions. That conference came to the conclusion that such a complete interchange would not be quite possible, but had drawn up a syllabus of an examination showing what general education would be required for surveyors to practice anywhere in the Empire. He believed it was not impossible at the present time to draw up a syllabus for an examination showing the general education only, not specialised. A feature of their Conference was that all experienced people, teachers, employers and engineers, had warned them against specialisation. In regard to the scientific part of the education the object of that was expressed extremely well by Mr. Petavel in his second proposition. The fault of the young man who had a degree and who had come from college was that he knew everything better than the practical people to whom he came. He had to be convinced that he knew nothing, then he was of use. In closing the Conference he had great pleasure in thanking the members, and especially the friends who had come and helped them in joining in the discussions, for their presence. He also had pleasure in thanking the chairmen of the sections for the great trouble taken in conducting the meetings, and not less the honorary secretaries of the sections and those gentlemen who prepared introductory remarks for the various sections. He was perfectly certain he also spoke with their concurrence in thanking Dr. Tudsbery and the staff of the Institution.

Mr. Siemens then declared the Conference closed.

ELECTRIC DRIVING OF TEXTILE MILLS.

The receipt from the Westinghouse Company's publishing department of a little booklet on loom motors reminds us of the progress which has been made in recent years with the electric driving of textile mills.

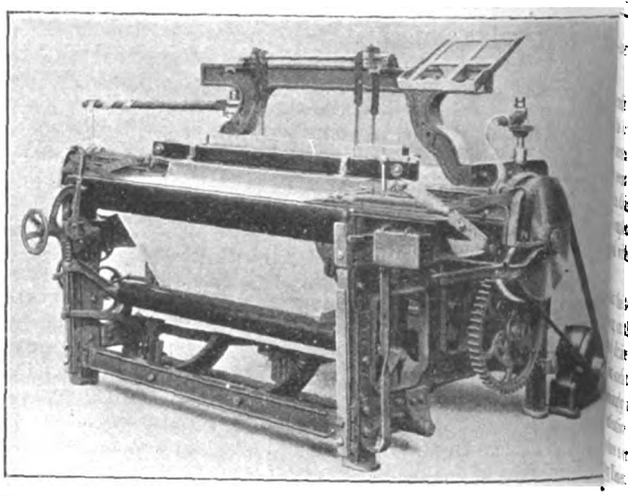

FIG. 1.—PLAIN OVERPICK LOOM FOR WEAVING SHORTING, CALICO, DOMESTICS, ETC., DRIVEN BY WESTINGHOUSE LOOM MOTOR, WITH SPRING BELT TIGHTENER AND PULLEY DRIVE.

For years electrical manufacturers tried hard to introduce the electric drive to the textile industry but without success. It was not that the textile manufacturers were ignorant of the claims put forward, or that they regarded them as chimerical. The real reasons militating against the adoption of the electric drive were quite other than these. There was first the fact that the wealth and success which were, and to some extent still are, such happy features of the industry had been built upon, and until recently were being maintained by the use of the steam drive.

The predominance held by the British textile industry, however, was threatened, on the one hand, by the appearance in the field of new competitors, and on the other hand, of old competitors equipped with the latest and best machinery. Its proud position was felt to be slowly but surely slipping away, and the familiar argument used in favour of electricity as against the mechanical form of drive—arguments hitherto unavailing—began to be effective when supplemented by the experience of American and Continental competitors who found that they were able to turn out better work and at less cost than with the old form of drive. But the application of electricity to textile manufacture in this country received an unfortunate setback at the outset of its career—a setback from which it was slow in recovering, and which had the effect of appearing to justify the more conservative manufacturers and of seriously disappointing the more advanced who had ventured to try the experiment.

When the first electric installations were put in British textile mills, a good many mistakes were made. The requirements of the industry had not been fully studied. The electrical engineers were

Digitized by Google

more or less ignorant of the peculiar conditions under which textile mills are operated, while, on the other hand, textile engineers were more or less ignorant of the capacity and peculiarities of the electric motor. For instance, it was not generally recognised in the early days that it is impossible to run medium-sized, open-type motors in the interior of textile mills unless they are specially designed, and arrangements made for ventilation by a supply of fresh pure air, or, alternatively, unless housed in a separate part of the building. Similarly the necessity of keeping cotton waste, &c., from the interior of the motor was only partially realised.

The electrical firms found it necessary to give close study to the new conditions. The field was a large one, the prospects attractive,

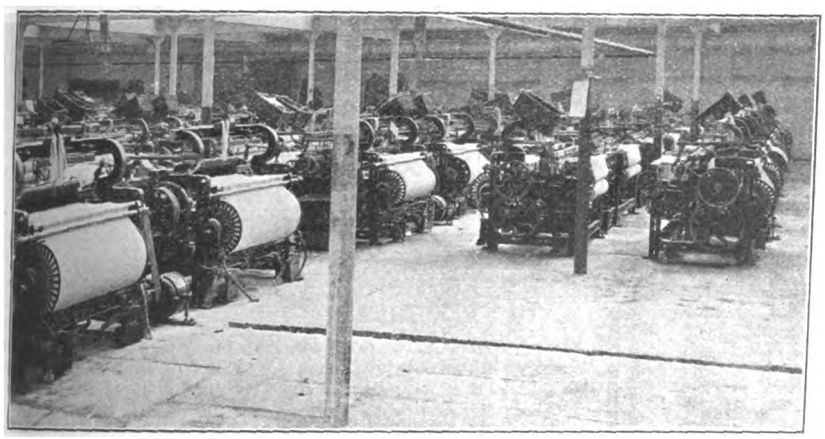

Fig. 2.—Another View of Weaving Shed showing ½-h.p. Loom Motors at Work.

and, to their credit be it said, they took it up vigorously, with the result that when the actual demands of the industry were known and catered for, success was instantaneous, and has been continuous; so that it really seems as if the resistance offered by the British textile industry to the claims of electricity, a resistance stubborn and prolonged, has completely collapsed, and one by one new mills are being equipped with, and old mills rapidly converted to, electric driving.

It is true that the textile manufacturer is very reticent to give the results following on the application of electricity; partly, no doubt, from a natural desire not to allow competitors the benefit of his experience; but such testimony as has been allowed to leak out has been overwhelmingly in its favour, and their very silence may be regarded as indicative of its efficiency, since unfavourable results would soon produce a crop of complaints.

The "Factory Times," a paper entirely devoted to the interest of the mill operatives, recently published the following note in connection with the equipment of a weaving shed belonging to Messrs. Edward Hibbert & Co., of Hyde, with individual electric drive for each loom.

"Electrically-Driven Looms."—The new shed recently built by Messrs. Edward Hibbert & Co., Greencroft Mill, is being driven by motors. The looms are running much quicker and steadier than they did under the ordinary system and the operatives are well satisfied with the alteration. The motors are so arranged as to use a short belt and the drive ensures smoothness of running and prevents slips.

Like the boy's beans in the fairy tale, electricity has extended itself immeasurably, and though the textile industry was not the first, and is hardly likely to be the last, to welcome the advance of electricity, now that its success has been fully demonstrated, and its claims carried to a triumphant vindication, there is very little doubt that the old cumbersome form of drive is doomed to displacement in favour of electricity, in the same way as the modern textile machine has displaced the primitive hand-loom, and for the same reason.

The first obvious advantage in the driving of textile factories by electric motors is naturally the elimination of the cumbersome gearing, the long lengths of shafting and heavy rope drives, and therefore the first step in advance from the old steam-driven factory was to instal motors of fairly large size driving groups of machines. This was called the "grouped drive" system. It was, however, found that for certain classes of work, notably ring spinning and weaving, it was possible to obtain far more satisfactory results by installing a separate small motor to each machine. This is called the "individual drive" system. In the case of many textile processes, some mill managers and others remain unconvinced as to the advantages of electrification, but in the case of weaving looms it is now an accepted fact that the best possible method is the individual electric drive. In the first place, it carries with it a great saving of power, since a standing loom uses no power, and everybody knows how frequently looms are standing and how the power required to run countershafting bears a very large proportion to that required to run the looms: the lighting of the shed is also greatly improved, as no overhead belts remain. Although this is the most immediate obvious advantage it is practically the least important.

When considering the individual drive as a business proposition, we can assume (although the assumption is not really in accordance with the facts) that the cost of power remains the same for the electrical and the mechanical drive; then the only way to increase the net earnings of the shed is by an improvement in the quality or in the quantity of the output, or both.

The British Westinghouse Electric & Mfg. Co., in the handy little booklet which they have issued on this subject, make the claim that the individual electric drives, properly installed, fulfils both these conditions; the motor speed is absolutely constant and thus gives that smooth and even running so much sought after by the weaving shed owner. This steady turning moment and even running is impossible of attainment with a belt drive from a countershaft, because with the latter there is always a certain amount of slip which is constantly varying, however steady the prime mover may be. To a lesser extent the same is true of the rope drive.

There is also with countershafting a certain amount of slip, dependent on the amount of power transmitted, which does not exist in the case of the electric drive. As a result, a better quality of fabric is obtained from the electrically-driven loom.

It is also pointed out that with the mechanical drive it is impossible to run the looms at the maximum speed the material would stand, because this maximum would be continually exceeded owing to the variation in the speed, thus resulting in breakages, whereas the electric drive enables a high speed to be attained and thus materially increases the output of the shed.

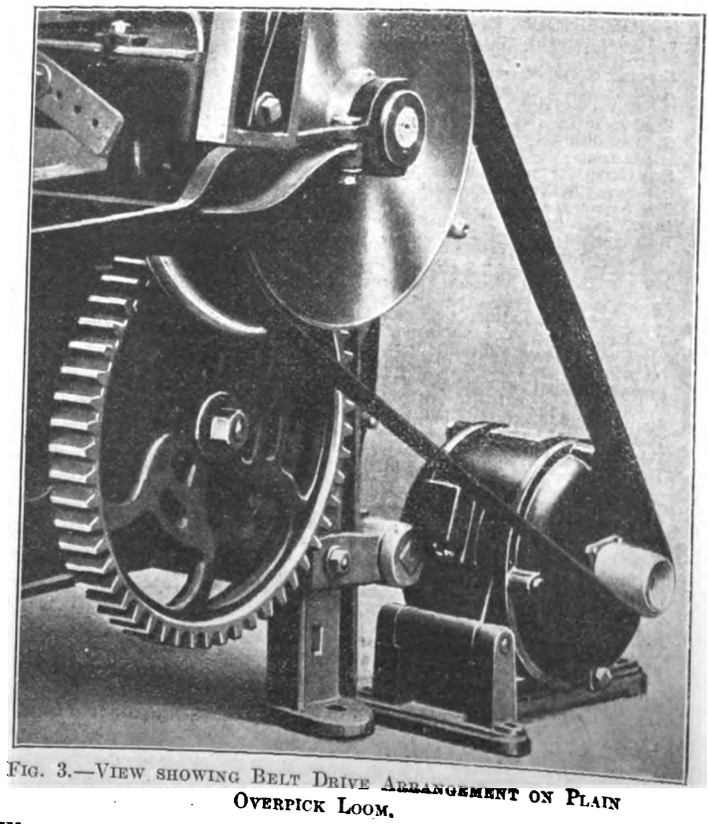

Fig. 3.—View showing Belt Drive Arrangement on Plain Overpick Loom.

We reproduce herewith three of the illustrations shown in the Westinghouse booklet, and any of our readers who are sufficiently interested can no doubt obtain a copy of this publication by applying to the British Westinghouse Electric & Mfg. Co., Trafford Park, Manchester.

The Rates for Subscription to "THE ELECTRICIAN" are as under:—

	Year.	Half-Year.	Quarter.	
United Kingdom	26s. 0d.	13s. 6d.	7s. 0d.	Post free, payable in advance.
Canada	28s. 3d.	14s. 6d.	7s. 6d.	
Postal Union ...	30s. 0d.	16s. 0d.	8s. 0d.	

New volumes of "THE ELECTRICIAN" *commence in April and October.*

(This charge includes all the numerous Supplements.)

Vols. I to LXVI. can now be supplied. Price on application.

"THE ELECTRICIAN" SERIES OF STANDARD ELECTRICAL BOOKS

can be obtained of all Booksellers at Home, in the Colonies, and Abroad.

"THE ELECTRICIAN" ELECTRICAL TRADES' DIRECTORY AND HANDBOOK. Published annually in February, corrected to mid-February. Established 1882. A very valuable advertising medium, covering the entire Industry. SUBSCRIPTION Price (which is received *in advance* up to Jan. 31st in each year for the next following edition) 8s. 6d. nett, postage 9d. extra. Published price 15s. nett, postage 9d. extra. Postage to British Colonies, 2s.; Europe, 2s.; U.S.A., 3s. 6d.; other countries, 2s. 6d. *Digest of Contents of the 1911 Edition sent free on application.*

THE PRACTICAL WIRELESS SLIDE RULE. By Dr. H. R. Belcher-Hickman. Price 2s. 6d. nett.

LIVINGSTONE'S DIAGRAM FOR THE EASY CALCULATION OF SHAFT AND BEAM DEFLECTIONS. By R. Livingstone. 2s. 6d. nett. By post in tube, 2s. 10d.

"THE ELECTRICIAN" PRIMERS (81 Primers in all, and a GLOSSARY). Single Primers 3d. each post free. *New and Enlarged Edition in One Complete Vol. or Three Separate Vols.* FULL PROSPECTUS FREE.

ELECTRIC TRACTION ON RAILWAYS. By Philip Dawson. Price 25s. nett. *Prospectus free.*

ALTERNATING-CURRENT MOTORS. By Dr. Rudolf Goldschmidt. Price 6s. 6d.

THE SHOT-FIRER'S GUIDE: A Practical Manual on Blasting and the Prevention of Blasting Accidents in Mines, Quarries, &c. By W. Maurice. Price 3s. 6d. nett.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. Wilkinson, M.I.E.E. *New Edition.* Now ready. Price 15s. nett.

ELECTRIC BLASTING APPARATUS AND EXPLOSIVES: With Special Reference to Colliery Practice. By W. Maurice. Price 8s. 6d. nett.

THE ELECTRIC FURNACE IN IRON AND STEEL PRODUCTION. By John B. C. Kershaw, F.I.C. Price 3s. 6d. nett.

BRAKES FOR TRAMWAY CARS. By H. M. Sayers. Price 3s. 6d. nett.

THE MECHANICAL DESIGN AND CONSTRUCTION OF COMMUTATORS. By R. Livingstone. Price 6s. nett.

THE ALTERNATE-CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Prof. J. A. Fleming, M.A., D.Sc., F.R.S. [abroad 13s.

VOL. I.—Price 12s. 6d. post free, abroad 13s. VOL. II.—Price 12s. 6d. post free, abroad 13s.

HANDBOOK OF THE ELECTRICAL LABORATORY AND TESTING ROOM. Very fully illustrated. By Dr. J. A. Fleming. Vol. I., 12s. 6d. nett. Vol. II., 14s. nett.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. Fleming. 6s. nett.

ELECTRICAL LABORATORY NOTES AND FORMS. Arranged by Dr. J. A. Fleming, M.A., F.R.S. Single copies 4d. nett, or in dozens at 3s. 6d. nett. Complete Sets of 50 Notes and Forms, 12s. 6d. nett, or in strong portfolio, 14s. nett; or bound in strong cloth, 15s. nett. Spare Copies of Tabular Sheets, 1s. per dozen. Portfolios, 1s. 6d. each. Sectional paper, 1s. per dozen sheets. *Complete Prospectus post free on request.*

ELECTRICITY METERS: THEIR CONSTRUCTION AND MANAGEMENT. By C. H. W. Gerhardi. Profusely illustrated. Price 9s. nett.

ELECTRICITY IN HORTICULTURE. By Prof. S. Lemstrom. Illustrated. 3s. 6d nett.

RADIO-ACTIVITY: AN ELEMENTARY TREATISE, FROM THE STANDPOINT OF THE DISINTEGRATION THEORY. By Fredk. Soddy, M.A. Fully illustrated. Price 6s. 6d. nett.

ELECTROMAGNETIC THEORY. By Oliver Heaviside. Vol. I. Price 12s. 6d. Vol. II. Price 12s. 6d. *Vol. III. in the press.*

MOTIVE POWER AND GEARING FOR ELECTRICAL MACHINERY. By E. Tremlett Carter, C.E., M.I.E.E. Revised by G. Thomas-Davies, A.M.I.E.E., F.C.S. Price 12s. 6d. nett.

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. Ewing, B.Sc., F.R.S., F.R.S.E. Price 10s. 6d.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. Kennelly and H. D. Wilkinson, M.I.E.E. Price 6s. 6d.

ELECTRIC MOTIVE POWER. By Albion T. Snell. Price 10s. 6d. nett.

A POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. Geipel and H. M. Kilgour. Price 7s. 6d. nett.

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. Elton Young. Price 10s. 6d.

STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By H. K. C. Fisher and J. C. H. Darby. Price 7s. 6d. nett.

SIGNALLING ACROSS SPACE WITHOUT WIRES: THE WORK OF HERTZ AND HIS SUCCESSORS. With new Chapter on Tuning. By Dr. Sir Oliver J. Lodge. Price 5s. nett.

THE ART OF ELECTROLYTIC SEPARATION OF METALS. By Dr. G. Gore, LL.D., F.R.S. [Price 10s. 6d.

ELECTRO-CHEMISTRY. By Dr. George Gore. Price 2s.

BEGINNER'S MANUAL OF SUBMARINE CABLE TESTING AND WORKING. By G. M. Baines. Price 7s. 6d. nett.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By Francis Jehl. Price 10s. 6d.

"THE ELECTRICIAN" WIREMAN'S POCKET BOOK. Price 5s. nett.

"THE ELECTRICIAN" HANDY WIRE TABLES FOR THE POCKET. By P. B. Down, Wh.Ex., A.M.I.Mech.E. Price 2s. 6d. nett.

THE RATING OF ELECTRIC LIGHTING, ELECTRIC TRAMWAY, AND SIMILAR UNDERTAKINGS. By W. G. Bond, M.I.E.E. Price 2s. 6d. nett.

DRUM ARMATURE WINDING AND COMMUTATORS. By F. M. Weymouth. 7s. 6d.

PRIMARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By W. R. Cooper. Price 10s. 6d. nett.

SECONDARY BATTERIES: THEIR CONSTRUCTION AND MANUFACTURE. By E. J. Wade. [Price 10s. 6d. nett.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. Price 1s. 6d.

THE LOCALISATION OF FAULTS IN ELECTRIC LIGHT CABLES. By F. C. Raphael. 7s. 6d.

THE STEAM-ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. Beaumont, M.I.C.E., M.I.M.E., &c. Price 6s. nett.

THE ELECTRIC ARC. By Mrs. Ayrton. M.I.E.E. Price 12s. 6d.

TRAMWAY TRACTIVE EFFORT AND POWER DIAGRAM. By Arnold G. Hansard, B.A., A.M.I.E.E. Price 4s. 6d. nett; in Tube, 5s.

THE BRITISH POST OFFICE TELEPHONE SERVICE. Fully Illustrated. Price 3s. 6d. nett.

INTERNATIONAL TELEGRAPH CONVENTION AND SERVICE REGULATIONS. Price 6s. nett. (LISBON REVISION, 1908.)

BOILER FEED WATER. By F. W. Anderson. Price 6s. nett.

(PRELIMINARY) WIRELESS TELEGRAPH CONFERENCE (BERLIN, 1903), PROCEEDINGS AT. Price 8s. 6d. nett.

INTERNATIONAL WIRELESS TELEGRAPH CONVENTION AND SERVICE REGULATIONS (BERLIN, 1906). With complete report of Proceedings. Price 21s. nett.

THE TWO-TONE VIBRATING TRANSMITTER AND CABLE INDUCTIVE SIGNALLING. By Edward Raymond-Barker. Price 1s. nett and post free. [Price 3s. nett.

THE CLASSIFICATION OF ALTERNATE-CURRENT MOTORS. By V. A. A. Fynn, M.I.E.E.

ELECTRIC CRANES: THEIR DESIGN, CONSTRUCTION AND APPLICATION. By H. H. Broughton. Being Vol. I. of a Complete Manual of Lifting and Hauling Machinery. *Ready shortly*, price 25s. nett.

MANUAL OF THE TELEPHONE. By W. Aitken, M.I.E.E. *Nearly ready.*

ELECTRIC MAINS AND DISTRIBUTING SYSTEMS. By J. R. Dick, B.Sc., and F. Fernie, A.M.Inst.C.E. *Nearly ready.*

ELECTRICAL MANUAL FOR MINING ENGINEERS. By H. J. S. Heather, M.I.E.E. *Ready shortly.*

THE MECHANICAL DESIGN AND CONSTRUCTION OF GENERATORS. By R. Livingstone. *In Preparation.*

STUDIES IN LIGHT PRODUCTION. By R. A. Houston, M.A., Ph.D., D.Sc. *In Preparation.*

LIGHT, RADIATION AND ILLUMINATION. From the German of Paul Hogner, by Justus Eck. *In Preparation.*

WIREMAN'S POCKET BOOK AND ELECTRICAL CONTRACTOR'S HANDBOOK. Compiled by A. W. Robinson and W. E. Warrilow. *Nearly ready.*

"THE ELECTRICIAN" INDUSTRIAL SUPPLEMENT.

With "THE ELECTRICIAN" for Sept. 14, 1906, was issued the first of a series of "Industrial Supplements," to be published from time to time with "THE ELECTRICIAN." The fifty-third issue of the Supplement published (Gratis) with the number of "THE ELECTRICIAN" for September 23, 1910, was the last of the monthly issues. "THE COMMERCIAL AND INDUSTRIAL SUPPLEMENT" to "THE ELECTRICIAN" is now issued weekly (Gratis). It will be found towards the end of the present issue.

NOW READY.

Vol. LXVI. of "THE ELECTRICIAN." Bound in Publisher's covers. Price 17s. 6d. Postage U.K. 1s. extra, abroad 2s. 6d.

Cases for binding Vol. LXVI. are now ready, price 2s.; post free, 2s. 3d.

POWER SUPPLY DEVELOPMENTS.

Electrical engineers are wont to look forward to a time when electrical power will be generated at a few mammoth generating stations—situated in this country adjacent to the larger coal fields, and in America and Africa, perhaps, near big waterfalls. Such schemes, however, up to the present time, have rarely been worked out in any detail, and when any attempt is made to draw up a definite scheme it has usually been assumed that the whole of the power required in the various industrial centres will be transmitted electrically. An interesting modification of this idea was suggested by Mr. F. DARLINGTON, of the Westinghouse Company, in a Paper, of which an abstract appears elsewhere in this issue, read a month or two ago before the National Electric Light Association.

In dealing with the power supply problem the author took, as an example, Eastern Pennsylvania, and considered that at the present time the best results—from the point of view of economy—could be obtained, not by transmitting the whole of the electrical energy required by the cities of New York and Philadelphia from the anthracite coal mines of Eastern Pennsylvania, but rather by installing overhead lines capable of transmitting only about one-third of the total demand for electric power in those towns. These lines would be used for supplying from the coal-fields the long-hour load, whilst the existing steam power stations in the cities would deal with the short hour or peak load. In this way Mr. DARLINGTON pointed out that three-quarters of the total output of units would be

Digitized by Google

generated at the coalfields, thereby rendering unnecessary the conveyance of the greater part of the coal at present required by the existing stations.

The distances involved are from 90 to 120 miles, and are similar to those separating London from the nearest coalfields of this country. Here, too, the transmission of electric energy from the coalfields to the metropolis has been suggested, but so far there has been no practical result. The difficulty is to make out a case for transmission of energy as against transport of coal. If the whole of the energy is generated at the coalfield, then there will be a loss of, say, 10 to 20 per cent. in transmission. There will also be capital charges on the line, and there will be its maintenance. These losses and charges must show an advantage over the cost of carriage in the other case in which the station is placed in the industrial centre. A large station working with a good load-factor will require 3 lb. to 4 lb. of coal per unit, or will generate, say, 650 units per ton. Thus, for every shilling per ton spent on transit, the fuel cost will be raised by nearly 0·02d. per unit. This may be somewhere in the neighbourhood of 10 per cent. of the fuel item and counterbalance a considerable part of the transmission loss when the station is placed at the coalfields. There remain, however, the charges in regard to the line, and the cost of the additional generating plant to supply the line losses.

In the suggested arrangement of a station at the coalfields to handle the steady load, working in parallel with stations in the industrial area to take the peak load, the case is slightly different. Such a main station would be working at a very high load-factor and the coal per unit might fall to half the figure just given. Consequently, the units lost in transmission would be generated very cheaply. On the other hand, the peak load stations, owing to the character of their load, would consume a much larger amount of coal per unit, and although such stations would only generate, say, a quarter of the total number of units, the resulting inefficiency could not be neglected.

Of course, something will depend upon the size of the stations and upon the character of the load. London and Birmingham, for instance, would differ largely, leaving their positions out of account. The load in London is very largely of the residential type, whereas that in Birmingham would be more industrial. Looking forward, however, to the time when electrical energy will be very much more in use than at present, and when domestic applications are much more general, the question of peak loads will not be so important, for such loads will tend to disappear, and the main differences will be between night and day, or between summer and winter. The reason for the peak load station will then no longer exist.

In fact, it is not obvious that the splitting up of a station working under good economical conditions into two stations, one working with the highest economy and the other being run under poor conditions, will give very much improved results. Apart from fuel economy, capital charges become all-important when the load consists of peaks, the running cost being but a small part of the total cost of generation in such cases. By installing the whole of the plant in the industrial centre the plant capacity is reduced to a minimum, and although the fuel conditions may not be the most economical, it is difficult to make out a clear case for transmission under these conditions.

ABNORMAL PRESSURE RISES ON H.T. ALTERNATING CIRCUITS.*

BY J. R. DICK, B.SC.

Summary.—In this article the author deals with the conditions under which "resonance" appears in cables, and shows that most disturbances on networks are due to this cause. The oscillations which occur when the current is switched on or switched off are also considered.

Mechanical Analogies.

The expressions "resonance" and "capacity effects" are popularly employed when dealing with all phenomena of this nature, although resonance often plays but little part in their production. To the mains engineer their dangers are well known, and fortunately efficient safeguards are now available by which these dangers can be minimised.

To deal first with the question of resonance, properly so-called, it may be stated that it is not, as a rule, the chief source of trouble on alternating circuits. It is, however, capable of explanation in an elementary way with greater clearness than some of the other kinds of pressure rises, and will, therefore, be first considered. Even in this case, the true physical meaning of the electrical phenomenon cannot be appreciated, unless the general principle of resonance has been studied, in relation to other forms of energy, such as mechanical vibrations and sound waves.

In an electric alternating circuit the waves of E.M.F. and current produced by the generator are obviously of the nature of forced vibrations. Now, what are the natural vibrations? These are produced by the discharge of a condenser or a circuit containing capacity, under certain conditions as to the amount of inductance and resistance associated with it. A concentric or multi-core cable system acts, of course, as a condenser, and if the resistance is small, as it usually is, this condenser will have an oscillating discharge, with a natural period depending only on its own capacity and the inductance in circuit.

The algebraic relationship is

$$2\pi n = \frac{1}{\sqrt{LK}},$$

where n is the frequency of the natural oscillation, L the inductance and K the capacity in series with it.

When capacity and inductance in series neutralise each other, giving resonance, the pressure at the condenser terminals becomes much greater than the supply pressure. Fortunately in most high-tension lines this condition does not prevail, and the pressure rise due to resonance does not reach an infinite value, which it might do, if R were infinitely small. Another reason why resonance effects are the exception is that the value of n found from the equation $2\pi n = \frac{1}{\sqrt{LK}}$, for the usual values of L and K is so high—*i.e.*, of the order 300 to 2,000 periods per second. As alternating-current supply is now mostly given at a frequency from 25 to 50, resonance with the fundamental waves of the generator is practically impossible. But the alternator may not produce waves of exact sine form, as has been assumed in the explanation given above, and the actual waves may contain harmonics or overtones.

These harmonics are little ripples on the fundamental wave, and, although of small amplitude, their frequency may be 3, 7, 13, or any odd multiple of times greater than that of the fundamental, and hence one of them may have a value which satisfies the conditions of resonance.

Even when *exact* synchronism does not exist between the fundamental waves (or one of the harmonics) and the natural waves, resonance may still occur to a greater or less extent,

depending on the nearness with which these two values approximate to synchronism. Frahm's frequency indicator illustrates this, as there are always some reeds near the one in actual synchronism, which vibrate with the same applied frequency, but to a much less extent.

The effect of load currents is to diminish the maximum values to which the voltage and current will attain under resonating conditions. This is not perhaps of great assistance to those who have to watch for possible breakdowns in the mains, as there will frequently be times of light load on certain circuits, which would offer favourable conditions for abnormal pressure rises. In a circuit feeding transformers through concentric cables, if the outer is not earthed or if the usual earth connection is accidentally broken and the switch on the outer conductor is opened, the capacity between the outer conductor and earth is then in series with the inductance of the alternator and transformer and, given appropriate values, resonance may result.

Prevention of Resonance.

The safeguards to prevent injurious pressure rises of the kind described are briefly as follows. Most of them belong more to the generating department, and are out of the control of the distribution staff :—

1. Employment of an alternator which gives practically pure sine waves and few or no harmonics.

2. Permanently earthing the outer at one or more places through a non-inductive resistance. This should be of such an amount, that the rush of current through it is just sufficient to blow the fuses or trip the circuit-breakers on the inner, when a resonance rise occurs.

3. When connecting an uncharged main to a separate generator, run up the latter to the speed of normal frequency before exciting the fields. This avoids the possibility of resonance with frequencies (or harmonics of them) less than the normal, through which the generator voltage passes in running up.

4. In connecting an uncharged main to the 'bus bars, to employ some form of charging gear such as that used at Deptford, or by gradually cutting out a non-inductive water resistance which has been first placed in series with it.

The best practical way of investigating the possibilities of the occurrence of resonance in any circuit is not to calculate the values of L and K, but to make use of the Duddell oscillograph, which will indicate for any conditions under which the mains are tested whether resonance is present in any degree, or whether it is likely to occur with any modification of the conditions.*

Pressure Rises produced on closing a Circuit containing Capacity and Inductance.

These phenomena are often loosely ascribed to resonance, which is misleading. To make use of a mechanical analogy, they are closely akin to the impact of a load on an elastic body. When a weight, w (Fig. 1), is applied gradually to the spiral spring suspended at P, it will produce an elongation equal to FA. The tension of the spring, equal to w, can then be represented by the ordinate AK, and at any other point, L, during the process of stretching the tension is given by LM. If now the weight w be *suddenly* applied its potential energy, as it falls, will be diminished proportional to $w \times$ FA at the point A, and this change of potential energy is represented by the rectangle AKEF.

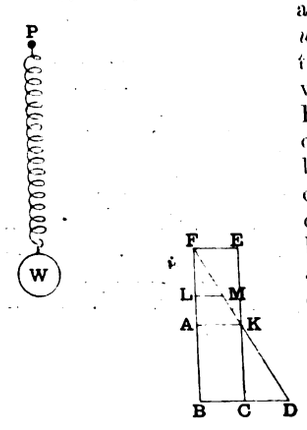

Fig. 1.

From Hooke's law the work done in stretching the spring a distance of FA is represented by the triangle AFK. There is thus a balance of the potential energy represented by FEK, which appears as kinetic energy, and if v be the velocity of the weight at the point A, this kinetic part will be $\frac{1}{2} \cdot wv^2/g$.

* The best English study of resonance from the theoretical and practical points of view is to be found in Mr. M. B. Field's Paper, "Journal" Inst. E.E., June, 1903, Vol. XXXII. (*See also* Electrician, Vol. L., p. 979).

The weight will then continue moving, but with gradually diminishing speed until it reaches B. At this point all the kinetic energy it possessed at A will have disappeared as part of the total work done in stretching the spring from A to B.

The fall of the weight from A to B is equivalent to a diminution of its potential energy of $w \times$ AB, represented by the rectangle AKCB. This is one part of the work done in stretching the spring, and the balance of the work done, shown by the triangle KCD = FEK, is supplied by the kinetic energy which the weight had stored up in it at A.

It will be seen from the diagram that the ordinate, which gives the tension of the spring at any point, is BD at B, and is equal to twice AK, which represented the normal tension due to a weight steadily hanging on the spring, and thus it can be stated generally that the tension produced by an impact or suddenly applied load is twice that due to a steady load.

In order to study the close resemblance which this mechanical example bears to the effect produced in a condenser when suddenly connected to a supply at constant potential, it is best to write down the equation representing the state of things when the weight in its fall has reached the point A. The law of conservation of energy gives at once the following relationship :—

Loss of potential energy at A = work done + kinetic energy.

Or if FA = x,

$$wx = \tfrac{1}{2}\mathrm{T}x + \frac{\frac{1}{2}wv^2}{g} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

As A is the normal position, when the weight is gradually applied T = w, and it follows that the kinetic energy, when the weight is travelling past that point, is equal to the work already done. At B the velocity $v = 0$, and, therefore, T = $2w$. The corresponding terms in the electrical analogue—*i.e.*, a circuit containing capacity and inductance suddenly connected to a source of constant E.M.F., are as follows :—

Weight, w = voltage of supply, E.
Tension, T = voltage on condenser plates, V.
Displacement, x = quantity of electricity, Q.
Velocity, v ($= dx/dt$) = current = dQ/dt = C.
Mass, w/g = inductance, L.

On application of the E.M.F., E, after a very small interval of time (so small that E may be supposed constant throughout, whatever its law of variation), the condenser will be charged to a pressure V, so that

$$\mathrm{EQ} = \tfrac{1}{2}\mathrm{VQ} + \tfrac{1}{2}\mathrm{LC}^2 \quad . \quad . \quad . \quad . \quad . \quad . \quad (2)$$

by transposition of the mechanical terms in the equation (1).

At this stage of charging, the "potential or electrostatic energy" part is equal to the "kinetic or electromagnetic energy" part, and V = E, but the charging current C, then at its maximum, cannot stop suddenly, and only dies down to zero when the pressure V across the condenser is equal to twice the supply pressure E. This can be seen from equation (2), for, when C = 0, V = 2E.

In stating this possible maximum the resistance of the circuit has been neglected, so that, in practice, a less surge of pressure than 2E is to be expected.

The rise will also be less than twice the maximum voltage when an alternating current is employed, if the phase of the voltage, at the instant of switching on, is not passing through its maximum value.

Reverting to the mechanical example, it can be verified by experiment that the weight after its displacement to B will vibrate about the mean position A until frictional losses finally bring it to rest at A.

In a similar manner the pressure in the condenser will oscillate between zero and double the normal value, until it ultimately reaches the latter. These oscillations of pressure are very rapid, and have the *natural* frequency of the circuit.

This can be proved by reference to equation (2). At the mean position $\frac{1}{2}\mathrm{QV} = \frac{1}{2}\mathrm{LC}^2$, or electrostatic = electromagnetic energy, but since Q = KV, where K is the capacity in farads,

$$\tfrac{1}{2}\mathrm{KV}^2 = \tfrac{1}{2}\mathrm{LC}^2,$$

or,

$$\mathrm{C} = \mathrm{V}\sqrt{\frac{\mathrm{K}}{\mathrm{L}}} = \mathrm{KV}\sqrt{\frac{1}{\mathrm{KL}}} \quad . \quad . \quad . \quad . \quad (3)$$

Digitized by Google

But the current C in a condenser of capacity K in a circuit whose frequency is n is

$$C = KV2\pi n. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4)$$

Thus, to satisfy (3) and (4) it is necessary that $2\pi n = \sqrt{\frac{1}{KL}}$ which has already been shown to be true of the natural frequency n.

The preventive against the injurious effects of pressure surges of this kind is to switch concentric cables into live systems, gradually, through a non-inductive resistance.

Pressure Rises on switching off Heavy Currents.

These also are frequently spoken of as being due to resonance, but although oscillations are produced when a heavy current is broken, there can be no resonance as the original forced vibration has ceased with the breaking of the current.

The mechanical analogy is not quite so simple in this case. Returning to the spiral spring and weight, suppose the latter to have a forced simple harmonic vibratory movement, so that it was doing work against an external force conforming also to the S.H. law. If this force be withdrawn, when the speed is a maximum—that is, when the weight is passing through its mean position—the kinetic energy it possesses must find an outlet in stretching the spring. The amount of stretching will depend on the mass and the speed. If T is the final tension in the spring, when the mass comes to rest after a displacement, x, the work done, $\frac{1}{2}Tx$, must equal the kinetic energy stored up in the moving mass $\frac{1}{2}mv^2$. To utilise the energy equation $\frac{1}{2}Tx = \frac{1}{2}mv^2$ for an electric circuit, consider a large alternating current C, with a frequency n, passing through a circuit containing an inductance, L, and a capacity, K, and a resistance small enough to be neglected as a first approximation. An interruption of the current C corresponds to the withdrawal of the external force in the mechanical analogy, and should the phase value of the current happen to be at its maximum the electro-kinetic or electromagnetic energy it possesses may be very large, as it is proportional to the instantaneous value of C^2. Thus, the electromagnetic energy equal to $\frac{1}{2}LC^2$ has no outlet except in charging the condenser of capacity K, formed by the concentric conductors.

The condenser will finally be charged to a potential V, when all the electromagnetic energy is converted into the electrostatic or "potential" form. Its value corresponding to $\frac{1}{2}Tx$ above will be $\frac{1}{2}QV$ (and since $Q = KV$) $= \frac{1}{2}KV^2$. The amounts of these two alternative forms of energy must be equal—*i.e.*, $\frac{1}{2}KV^2 = \frac{1}{2}LC^2$, and they will oscillate from one form to the other with a frequency which is the *natural* frequency of the circuit.

It will now be clear that the phenomenon cannot be one of resonance, as the forced oscillations cease entirely when the circuit is broken.

A happy analogy of the effect produced by the stoppage of a large alternating current is that of striking a blow on a tuning fork. A large proportion of the work done by the blow will appear as vibrations of the tuning fork, which, of course, will have their natural period. In contrast with this is the resonance phenomenon of the sympathetic vibration of two tuning-forks of the same pitch when only one of them has been set into vibration.

The relation $\frac{1}{2}KV^2 = \frac{1}{2}LC^2$ is different to that found for the case of closing a circuit, inasmuch as C is now the independent variable—that is, it may have a wide range of values depending on the external energy it had been furnishing. Whatever value C may have,

$$V^2 = C^2 \cdot \frac{L}{K} \text{ or } V = C\sqrt{\frac{L}{K}},$$

and thus V, the *additional* rise in pressure on breaking the current, C, will be proportional to its value, and will depend also on the electric constants of the line. As already shown, when $\frac{1}{2}KV^2 = \frac{1}{2}LC^2$ is the condition characteristic of the circuit

$$C = KV\sqrt{\frac{1}{KL}} = KV2\pi n,$$

or, $2\pi n = \sqrt{1/KL}$—that is to say, n is the frequency of the natural oscillations of the line. These oscillations are quickly damped down by the losses due to resistance, hysteresis and eddy currents. Pressure rises of the kind described, being directly proportional to the current broken, may reach dangerous values when the current is very heavy, such as that produced by a short-circuit. It will also be recognised from the expression $V = C\sqrt{\frac{L}{K}}$ that the pressure rise will be accentuated the more the inductance and the less the capacity in the circuit. High inductance means greater electromagnetic energy, and small capacity means a high voltage when the electrostatic energy $\frac{1}{2}KV$ becomes equal to the electromagnetic. In underground systems with high capacity the dangers from this kind of pressure rise are less than on overhead lines, with small capacity and a good deal of inductance. The safeguard in breaking ordinary load currents lies in the use of oil break switches, which have the remarkable property of interrupting the circuit exactly at the moment when the current is zero, or when the energy is entirely in the electrostatic form. A condenser connected across a switch or fuse will tend to break the arc immediately, because the condenser behaves, until charged, as a momentary short-circuit to the arc; lead-covered cables may act as condensers in this way. On some of the long transmission lines in America it is found to be easier to work with high voltages than with those relatively lower, because the current, being less with the higher pressure, the effect of breaking the circuit is not so disastrous. To guard against the effects of a short-circuit is not such an easy matter, as a pressure surge is bound to occur. In order to prevent the high pressure due to this or to resonance from damaging the insulation between the inner and the earthed conductor, possibly at a number of points, some form of lightning arrester has to be employed.

ELECTRIC PROPULSION FOR SHIPS.

The trial trip of the "Electric Arc," mentioned in our notes a few weeks ago, marks an important step in the application of electric power to the propulsion of ships. The "Electric Arc" has been

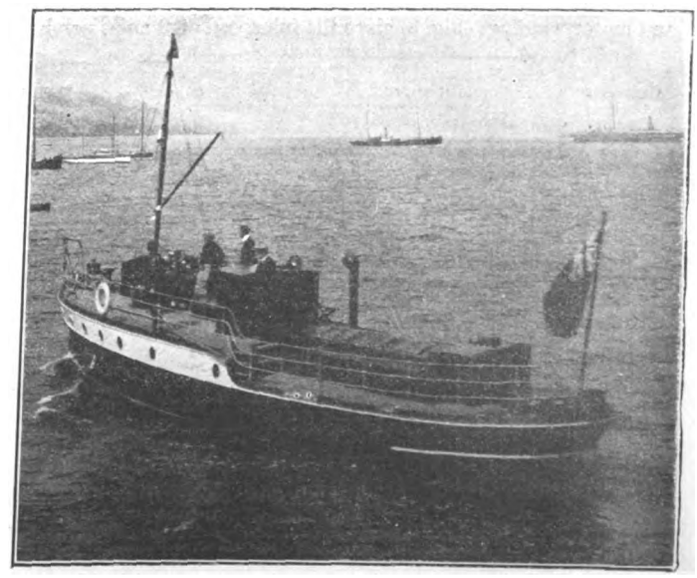

FIG 1.—THE "ELECTRIC ARC."

equipped by Messrs. Mavor & Coulson, and is fitted with alternating-current machinery, the system adopted being that devised by Mr. Mavor. The vessel, which has been constructed by Messrs. MacLaren Brothers, of Dumbarton, is shown in Figs. 1 and 2. It is 50 ft. long, its beam being 12 ft., its moulded depth 7 ft. 4 in. and its maximum draught 4 ft. 6 in.

The power equipment comprises a petrol engine of 35 B.H.P. which drives a three-phase alternator, whence current is supplied to an alternating-current motor on the propeller shaft. The vessel was

Digitized by Google

constructed and equipped so that experience might be gained in details of application and in the handling of alternating-current apparatus before proceeding to instal electric propulsion on a larger scale, the designers claiming that alternating-current motors are alone suitable for transmitting large powers at sea. It may here be mentioned that the experimental equipment in every way came up to expectations.

The "Electric Arc," being intended for short trips on coastal service, only one engine and one propeller are used, and as the vessel is equipped purely for experimental purposes, the engine room is left open, and no other use is made of the accommodation aft.

The electric motor installed has no brushes or slip-rings, and is of the "multiple wound" type, 8-pole and 12-pole windings being used.

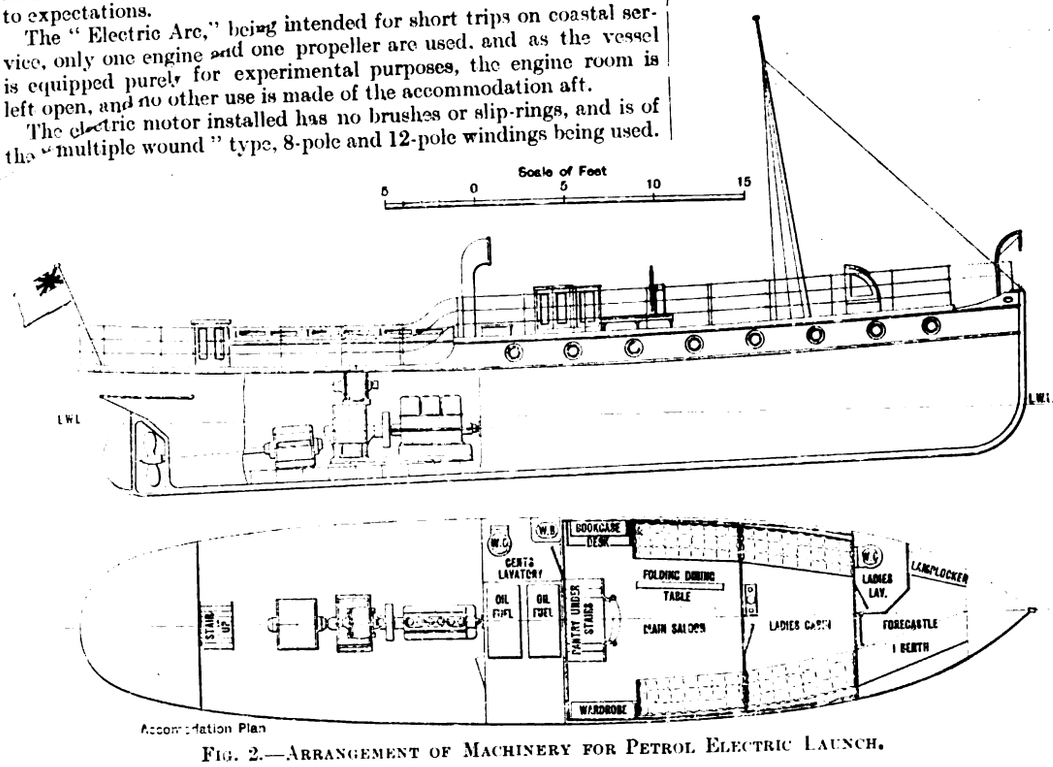

FIG. 2.—ARRANGEMENT OF MACHINERY FOR PETROL ELECTRIC LAUNCH.

The generator also has two windings (four-pole and six-pole) corresponding with those of the motor, and the various speeds are obtained by combinations of the windings (*see* article by Mr. Mavor in the Special Marine Issue of THE ELECTRICIAN). The exciter for the alternator is mounted on top of the latter, and is driven by belt from the main shaft.

The control gear is operated from the deck beside the switchgear, as well as from the engine room. The first combination of generator and motor windings (Fig. 3) gives the full speed of 8 miles per hour,

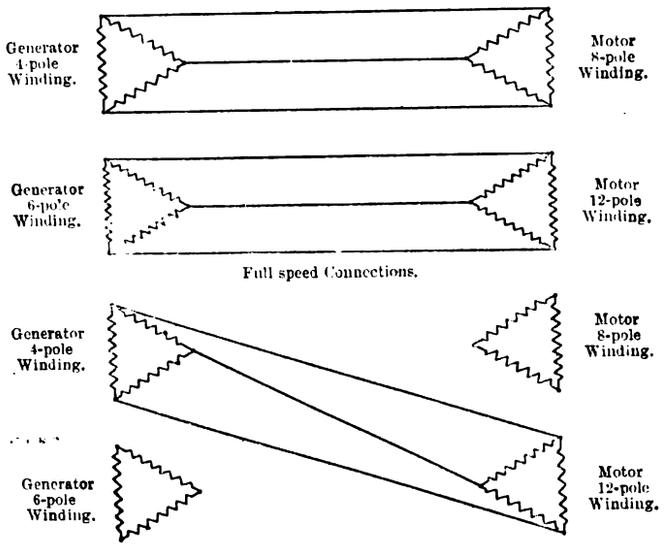

FIG. 3.—DIAGRAM OF CIRCUITS ON THE "ELECTRIC ARC."

and the second combination a speed of about 6 miles per hour. The control is by two switches, one varying the excitation of the alternator field, and the second, which is interlocked with the first mentioned, controlling the current supply to the motor windings, so as to give two speeds ahead and astern. These switches are operated directly by chain connection from the ship's telegraph on deck, so that the navigator actually performs the switching operations, the engineer merely attending to the running of the plant. An indicator is fixed in the engine room showing the position of the telegraph.

This method of control dispenses with resistances and auto-transformers for regulating the current and voltage supplied to the motor; the only resistance required is in the exciting circuit, where the current is comparatively small and the resistances are of a compact and simple character. Any exact adjustment of speed may be dealt with by controlling the speed of the engine or the exciting current.

The economy of the arrangement in the demonstration equipment was limited by the small size of the plant and by the shallow draught of the boat, necessitating a comparatively small propeller; notwithstanding those limitations, the efficiency of the electrically-driven propeller of large size and slow speed is, Messrs. Mavor & Coulson claim, such as to compensate for the loss in transmission as compared with the direct-application of the power to a high-speed propeller. In larger vessels the economy is more pronounced, and is important at full speed. At the lower speeds the economy is more conspicuous, and in cases where the ship is required to operate at widely differing speeds the economy resulting from the adjustment of the operating plant to the power required amounts to a saving in favourable cases of 50 per cent. of the fuel.

At the trial trip of the "Electric Arc" the mean speed attained for two runs over a measured mile was 8 miles per hour, and whereas the builders estimated that 45 H.P. would be necessary to drive the vessel at 8 miles per hour, the actual horse-power required from the engine was 35 B.H.P., giving 24·7 H.P. at the propeller, showing that although the loss in transmission at this low power is considerable it is more than compensated for by the saving in propeller efficiency. Stopping, starting, speed-changing and reversing were carried out very successfully, a feature being the ease and promptitude with which the vessel could be made to go ahead or astern at will, owing to the control of the machinery being in the hands of the navigator on the bridge.

Fears had been entertained that the manipulation of an additional group of machinery concerned only with transmission would complicate the engine-room operations, and consequently the time required for performing them, but, on the contrary, the operations were stated to be more simple than those at present necessary, the engineer's duties being more definite and continuous, in that his prime attention is devoted to keeping his machinery lubricated and running at a constant speed.

In the tests on the electric plant previous to its installation, when the motor was connected up to the generator, the two windings were found to divide the current between them approximately as expected —viz., four-pole 43 amps., six-pole 29 amps. The power factor as measured by wattmeter was found to be 0·79 for the 12-pole winding at about three-quarter load, and 0·88 for the eight-pole winding at about three-quarter load. The times taken to change the speed or direction of rotation of the motor were then measured, and were found to vary between 25 seconds from full speed in one direction to full speed in the opposite direction, to 8 seconds from rest to half speed, and 5 seconds from full speed to half speed in the same direction. It was found necessary to increase the exciting current from 39 amps. to 70 amps. in order to obtain these results.

Street Lighting in Chicago.—Figures given in the recent annual report of the department of electricity of Chicago show that the total number of public street lamps in service on December 31, 1910, was 37,994. Of these 12,366 were municipal arc lamps, 893 rented arc lamps, 11,990 gas-mantle lamps, 5,426 gas flat-flame lamps and 7,319 gasoline lamps. The cost of rented arc lamps is £15 a year and municipal arc lamps £12. 8s. a year

PHYSICAL SOCIETY.

At a meeting held on June 30 at the Imperial College of Science, Prof. H. L. CALLENDAR, F.R.S., President, in the Chair,

A Paper on

"The Capacity Coefficients of Spherical Electrodes"

was read by Dr. A. RUSSELL.

Formulæ have been given by Poisson, Kelvin, Kirchhoff, Clerk Maxwell and others for the capacity coefficients of spherical conductors at appreciable distances apart. With the exception of Kirchhoff's formulæ, these formulæ are rarely, if ever, used in practice. The author shows how the remainder after computing a few terms of Kirchhoff's series formulæ can be easily found. The range of their usefulness is therefore considerably extended. This extension makes it possible to simplify very appreciably the author's formulæ for the case, when the spheres are close together. Hence he shows that the numerical computation of the capacity coefficients can be easily made in all cases. Applications showing how the potentials, the capacities and the capacity currents of spherical electrodes can be calculated are given. A simple method of making a variable air condenser whose capacity in every position can be easily calculated to any desired accuracy is also given.

An Exhibition of the

Benkö Primary Battery

was given by Mr. W. R. COOPER. Several types of the Benkö battery, the invention of Mr. Stephen Benkö of Buda-Pest, were exhibited. This battery depends essentially upon the use of a porous carbon electrode in the form of a pot (open at the top) which is surrounded by a closed lead shell. The electrolyte (a bichromate solution) is fed into this shell under a suitable head to give a flow of ¼ litre, or more, per hour per cell. It passes through the carbon to the zinc, whence it is removed by an overflow pipe. Polarisation is thus reduced to a minimum and remains constant for a given current, provided the cell is not overloaded. The size of cell referred to is 9¼ in. high overall, 6¼ in. long and 1¾ in. wide; it weighs about 10 lbs., excluding the tank for electrolyte, and will give a steady current (depending upon the strength of the electrolyte and rate of flow) up to, say, 25 amps. at 1·5 volts. The internal resistance is below 0·01 ohm. There is no "mess" and no difficulty in keeping the apparatus in order. The cell is therefore very suitable for laboratory use or work where the cost is not of prime importance. Various types are being made according to the work required, and these include cells which depend for their action upon diffusion as distinct from a steady flow.

Mr. G. L. ADDENBROOKE asked whether the contact between the lead and the carbon remained satisfactory over a long time.

The AUTHOR replied in the affirmative so far as his experience (extending over 15 months) had gone.

The PRESIDENT inquired as to the maximum number of watts that might be taken from the battery continuously, and whether, weight for weight, more power could be taken from it than from accumulators.

The AUTHOR replying to the first part of the question said about 25 to 40 watts, depending on the solution, and stated that, excluding the reservoir, 3 to 4 watts per pound could be taken from the battery as compared with ½ watt (8-hour rate) up to 2½ watts (automobile cells at 5-hour rate) for accumulators.

Mr. W. DUDDELL asked how the battery would compare with accumulators for giving a steady current of the order of 5 amperes to 1 part in 100 or so. Accumulators could only be relied on to keep steady to about 1 part in 1,000.

The AUTHOR said he could not reply definitely, but he would expect better result from the Benkö battery bulk for bulk. It would be necessary to maintain a constant temperature. Replying to other speakers he further stated that the E.M.F. of a diffusion cell began to fall after hours' use, and that the electrochemical efficiency of the zinc in a diffusion cell was about the same as in an ordinary primary cell.

CORRESPONDENCE.

THE EDUCATION AND TRAINING OF ENGINEERS.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: It is not my intention to attempt to raise a controversy on the discussion of this subject just held at a Conference of the Institution of Civil Engineers. I merely wish to draw attention to a matter that seems to have been taken for granted in the discussion, but which, in actual practice, has little real existence viz., the technical training of engineers.

Now, the technical training of engineers in this country is by no means general. True, there are numerous universities and colleges with properly-qualified staffs and well-equipped laboratories for imparting technical training in all branches of engineering, but what advantage is taken of them? Consider, for example, the university colleges alone. What is the average number of students attending lectures in any one of the engineering faculties? In many of the departments scarcely a dozen students reach the course in the final year, and in many colleges this number would have to be halved. Again, of those who do successfully pass through such a course, how many are able to find work in their own faculty—so little is the demand for college-trained men.

On the other hand, think how great in proportion is the number of men—fully qualified to go through a course of study—who take up the engineering profession by entering the works directly on leaving school and never trouble in the least about a technical training, except perhaps by attending a few evening classes. Under such conditions, does it not seem ludicrous to speak of technically-trained men in engineering?

If Germany be taken as an example, it may at once be asked what schoolboy in that country ever thinks of becoming an engineer without passing through a technical university? Even foremen and artisan apprentices frequently attend full-time courses at a technical school and receive a scientific training much superior to many in England who possess both means and ability to go through an academic course.

Now in the medical or legal professions there are prescribed courses which candidates are expected to go through. The engineer, however, reaches no such status—for him a technical training or even a practical one is not obligatory, though, since the latter usually appears more promising, it is mostly adopted, whereas a lack of the former seldom afflicts disabilities, and is generally neglected.

To sum up the position of the college-trained candidate for the engineering profession in England at the present day, it is little exaggeration to say that the college man usually gets a very poor return for his outlay. In competition with the non-college man, he is frequently at a disadvantage by losing three valuable years or so, unless he is lucky enough to fall in with some enlightened employer. The college training must often be regarded as an educational luxury, sometimes fashionable, seldom necessary. An engineering degree seldom carries any advantages with it, social or otherwise, except perhaps in teaching. Even the Engineering Institutions make little of academic attainments, or distinctions, except in so far as they accept them as certain standards of knowledge.

Until the demand for technical men increases, then, it must not be wondered at that so many engineering apprentices entirely neglect the scientific side of their training and content themselves with a few evening classes or private study and experience for obtaining the minimum of technical knowledge they require.—I am, &c.,

Birmingham, July 20. STANLEY P. SMITH.

[We refer to this letter in the Editorial Notes.—ED. *E.*]

CAPE OF GOOD HOPE ELECTRICITY SUPPLY ORDINANCE.

On June 7 last the Deputy Administrator of the Cape Colony promulgated an Ordinance regarding electricity supply, of which the following is a full abstract:—

1. In this Ordinance the following terms shall, unless the contrary intention appears, have the meanings hereby respectively assigned to them:

"Local authority" shall mean: (*a*) The council or board of commissioners of any municipality, borough or corporate town. (*b*) The board of management of any locality in which the "Villages Management Act, 1881," or any amendment thereof is in operation. "Undertaker" shall mean: Any local authority, company, body, or person supplying, employing, or distributing electricity for public purposes within the area of a local authority. "Public purposes" shall mean any public scheme or system providing for: (*a*) The application of electrical energy for lighting or other purposes to or in connection with any street, place, hall, building or structure belonging to or subject to the control of a local authority. (*b*) The supply of electric light or electrical energy for private purposes to consumers generally within the area controlled by any local authority

Digitized by Google

(c) The application of electricity or electric current as a motive power for tramways, lifts, cranes and other like purposes within the area controlled by any local authority.

2. The supply and employment of electricity for public purposes shall in all respects be subject to the provisions of this ordinance and of any regulations in force hereunder.

3. Notwithstanding the provisions of any law to the contrary: (1) No undertaker shall supply or employ electricity for public purposes without the written consent of the local authority and the Administrator. (2) No local authority shall grant an electric lighting or power concession, or enter into or renew any agreement for or in connection with the supply of electricity for public purposes, without the written consent of the Administrator. (3) No posts or standards shall be erected in, nor wires laid across or under, any street whatever, within the area controlled by a local authority for the supply of electricity for public or private purposes without the consent in writing of such local authority. Provided that nothing herein contained shall affect or abridge any of the existing rights of the Government.

4. Before any proposed undertaking (or extension of or alteration to any existing undertaking) the total cost of which is estimated to exceed ½ per cent. on the total outlay on such undertaking, or where such amount is less than £100 for the supply of electricity for public purposes by an undertaker, is commenced within the area of any local authority other than the town council of Cape Town, the scheme, with proof of the consent of local authority, plans and specifications and all details of financial arrangements shall be submitted to the Administrator for his consideration and approval, and no work shall be done upon or in furtherance of any such proposed undertaking, extension or alteration until the Administrator shall have intimated in writing to the undertaker proposing such undertaking, extension or alteration, that he is satisfied that such scheme is suitable and the best practicable. The Administrator may at any time withdraw any condition imposed under the provisions of this section. If any condition imposed under the provisions of this section is not complied with, the approval of the Administrator may be withdrawn by him and any undertaker who, after notification of the withdrawal of such approval, shall wilfully perform any work in execution of such scheme, shall be deemed to be guilty of an offence against this ordinance and shall, on conviction, be punishable as hereinafter provided.

5. All charges hereinafter levied by any undertaker within the area of any local authority other than the town council of Cape Town for the supply of electric light or electrical energy for private consumers shall be in accordance with such tariffs and conditions of supply as may be approved of by the Administrator, and no charges levied under any tariff or conditions not so approved shall be recoverable. Such tariffs and conditions of supply shall be submitted for re-approval by the Administrator at intervals of not more than seven years. In respect of any building or premises owned or occupied by the Government within any area supplied by any such undertaker, the price and extent of the supply shall be subject to mutual agreement, but the rate shall not exceed the lowest charge to any private consumer within such area, or to any local authority. Provided that in considering charges, due regard shall be given by the Administrator to local conditions.

6. Subject to the provisions of this ordinance, any local authority may contract with any other local authority for a supply of electrical energy, or for public purposes, provided that when the boundaries of the contracting local authorities are not co-terminous, all work necessary to be done within the area of any intervening local authority or rural or divisional council shall be subject to any directions and conditions that may, with the approval of the Administrator, be given or imposed by such intervening local authority or rural or divisional council.

7. A local authority shall have authority, subject to the Administrator's approval, to purchase land for the purposes of providing for the supply of electricity for public purposes, and to borrow such money as may be required for the purpose of carrying out any scheme or undertaking or any alteration or extension of any existing scheme, for supplying electricity for public purposes, or for the purpose of acquiring the whole or any portion of any existing undertaking the property of another.

8. The Administrator may make, alter or repeal regulations in connection with the application by undertakers for approval of schemes for the supply or employment of electrical energy for public purposes, and the submission of schemes in connection therewith; the precautions to be taken to avoid interference with other electrical apparatus or works; and (save within Cape Town) the control of the execution and the carrying out of approved schemes by undertakers; the inspection of all works in use in connection with any undertaking for the supply of electrical energy for public purposes, and the holding of any inquiries for the purposes of this ordinance; and the conditions upon which consumers shall be entitled to a supply, and generally for the purposes of this ordinance.

9. Any local authority which is an undertaker, or in whose area an undertaker carries on operations, may make, amend or repeal regulations for the purpose of controlling within its area the distribution of electrical energy on private premises, with power to cut off the supply on failure to pay any charges due to the local authority in connection with such supply, or when such supply is no longer required, and to recover the expense of cutting off such supply, and providing for inspection; also where the local authority controls any tramway system, for the management of trams.

10. If electricity is supplied or employed for public purposes in contravention of the provisions of this ordinance, or if any act is committed in contravention of the same, any person or persons responsible for the offence shall each be individually liable to a fine not exceeding £100, and, in addition, to a penalty not exceeding £5 for each day during which the offence is continued, after notice thereof in writing has been given by the Provincial Secretary or by the local authority within whose area such undertaking is carried out. Any person who unlawfully and maliciously injures or interferes with any works connected with the supply of electricity for public purposes shall be guilty of an offence under this ordinance, and shall be liable to a fine not exceeding £100 or to be imprisoned with or without hard labour for any term not exceeding one year, or to both such fine and imprisonment. Any person who contravenes any regulations made by the Administrator or by the local authority shall be liable to a fine not exceeding £20, or, in the case of a continuing offence after due notice has been given, to a daily penalty not exceeding 40s., or where such fine is not paid to be imprisoned with or without hard labour for a period not exceeding three months, or in the case of a second or subsequent offence for a period not exceeding six months. Any person who fraudulently or maliciously abstracts, wastes or diverts, or causes to be abstracted, wasted or diverted, any electrical energy supplied for public purposes, or who consumes or uses such energy knowing the same to have been fraudulently abstracted or diverted, shall on conviction be punished in like manner as if he had been found guilty of theft.

11. In the case of existing undertakers this ordinance shall not apply until the expiration of 90 clear days from the date of promulgation, but, on the expiration of such period, all such undertakers shall become subject to the provisions of this ordinance and the regulations made by the Administrator hereunder: provided that the required consents shall be deemed to have been obtained to all schemes, contracts or agreements existing at the passing of this ordinance, but not to any renewals thereof whether contemplated in such contracts or agreements or not, and provided further that the provisions regarding the submission of schemes shall only apply to any further extension of or alteration to any existing undertaking the total cost of which is estimated to exceed one-half of 1 per cent. on the total outlay on such undertaking, or when such amount is less than £100: provided further that in the case of any agreement providing for the supply of electricity at a given price between an undertaker and a local authority, or between an undertaker and the Government, heretofore entered into, the above provisions as to charges for current shall not apply during the continuance of such agreement but shall apply to any renewals thereof whether contemplated in such agreement or not: provided lastly, the provisions of any law and of any regulations framed thereunder shall, unless amended or repealed, remain in force until the expiration of such period

12. The laws mentioned in the schedule hereto are hereby repealed, and any reference in any other law to "The Electric Lighting and Power Act 1895," or any regulations framed by the Governor thereunder, shall be deemed to be a reference to this ordinance and the regulations made by the Administrator hereunder.

13. The provisions of this ordinance shall not affect any company which has authority under any special act to work tramways by electricity within the area of a local authority: provided that if any such company desires to do anything not authorised by such act, the company may, after obtaining the consents required by this ordinance, do such thing, subject always to the provisions of this ordinance; and if the working of the undertaking of any such company shall at any time be transferred to a local authority, the special act relating to such company shall thereupon be repealed by the Administrator, and such undertaking shall thereafter be worked only under the provisions of this Ordinance and the regulations framed hereunder, without regard to any exemption granted to any local authority in the terms of this ordinance.

The following laws are hereby repealed in their entirety unless otherwise stated:—Electric Lighting and Power Act, 1895; Kimberley Borough Council Electric Lighting and Power Act, 1898; Cape Town Municipal Amendment Act, 1902 (sections 19 and 20); Green and Sea Point Municipal Amendment Act, 1902 (secs. 24 to 38 inclusive); Kalk Bay Municipal Council Electric Lighting and Power Act, 1904; Aliwal North Municipal Water and Electricity Supply Act, 1904 (sec. 29 to 41 inclusive, and sec. 6 and 7 of sec. 45); Port Elizabeth Electric Lighting and Power Private Supply Act, 1905; and Beaconsfield Electric Lighting and Power Private Supply Act, 1905.

The regulations to be made by the Administrator have not yet been published. Regulations in regard to the safety of the public will no doubt be made under this law, as the Mines Department of the Union of South Africa have decided to take charge of such matters referring to all kinds of machinery.

PARLIAMENTARY INTELLIGENCE.

GLOUCESTER CORPORATION BILL.

This bill, which contains some further provisions as to the electric supply undertaking, came before the Chairman of Committees in the House of Lords (Lord Donoughmore) on Tuesday last week. The Parliamentary agent (Mr. Browne) said that he understood their lordships were going to make an amendment to the wiring clause to secure that there should be no competition by the Corporation with local traders by the sale of wiring matters at less than cost price. The Corporation had introduced what was formerly the model clause in that respect, and the clause was agreed to in the other House as a result of opposition to the Bill. Therefore the Corporation must not be taken as assenting to any amendment their lordships made, and he asked that the clause should be allowed to stand.

His Lordship said the new model clause had been applied in several bills before that Committee this session, and no exception could be taken in respect to Gloucester. The bill, as amended, was ordered to be reported for third reading.

Digitized by Google

ROTHERHAM CORPORATION BILL.

On Monday and Tuesday this bill was before Lord Lamington's Committee of the House of Lords.

The bill is to confer further powers with regard to tramways, street widening, &c.

Opposition (by the Midland and Great Central Railway Companies) was now confined to the tramway extensions and the rail-less trolley proposals.

Ald. WINTER gave evidence in support of the bill and Mr. J. B. HAMILTON, manager of Leeds Corporation tramways, gave particulars of the Leeds rail-less trolley vehicles, which were started last month. Revenue per car-mile had averaged 10·4d. and running expenses 4·5d. He considered the Rotherham routes were suitable and that the system would be self-supporting.

Other evidence in support of the bill having been taken, the Committee adjourned.

TELEGRAPH CONSTRUCTION BILL.

On Tuesday the Select Committee of the House of Commons presided over by Mr. Herbt. Samuel (Postmaster-General) sat to consider this bill.

Sir ROBT. HUNTER, solicitor to the General Post Office, said the bill was to enable the Post Office to carry telegraph lines across railways without the consent of the railway companies. It was not proposed to make alterations in payments already made to the companies.

Petitions against the bill were put in on behalf of some of the Scottish railway companies and the Committee adjourned.

LONDON COUNTY COUNCIL TRAMWAYS BILL.

On Wednesday the Committee of the House of Commons passed the principal proposals of this Bill, but refused to sanction a loop line from Seven Sisters-road along Blackstock-road, Finsbury Park, to a new road to be made, and then rejoining Seven Sisters-road.

The bill was ordered to be reported as amended.

GREATER LONDON RAILWAY BILL.

A Select Committee of the House of Lords, under the chairmanship of Lord Newton, commenced consideration of this bill on Wednesday.

The Hon. J. D. FITZGERALD, K.C., explained the objects of the bill, and said it was believed that the necessary capital (£3,307,000, or £4,409,000 with borrowing powers) could be raised. The estimate for works and land was £2,810,000.

Amongst the opponents were Middlesex County Council and Finchley Council and the Great Eastern, L. & N.W., North London and Midland Railway companies.

Evidence in support of the bill having been given on behalf of Walthamstow, Edmonton and Tottenham Councils, and shipowners in the Australian, New Zealand and Argentine trade, the Committee adjourned.

Brighton, Hove & District Rail-less Traction Bill.—Brighton Corporation have withdrawn their opposition to this Bill, which will now go forward unopposed.

Bristol Tramways Bill.—This Bill was read a third time and passed in the House of Lords on Thursday last.

East Kent Electric Power Bill.—This Bill was read a third time and passed in the House of Lords last week.

London, Tilbury & Southend Railway Bill.—On Thursday last a Select Committee of the House of Lords passed this bill, providing for the electrical operation of the line, the acquisition of lands as sites for generating stations, the raising of £750,000 additional capital, &c.

New Pacific Cable.—In the House of Commons on Friday last the necessary financial resolution authorising expenditure out of money voted by Parliament for the construction and working of a new Pacific cable, passed through Committee and was reported to the House.

LEGAL INTELLIGENCE.

Central London Railway v. Land Tax Commissioners for the City of London.

In the Court of Appeal on Monday the Master of the Rolls and Lords Justices Farwell and Kennedy heard an appeal from the judgment of Mr. Justice Swinfen Eady, reported in THE ELECTRICIAN for March 3, p. 835. Mr. Justice Swinfen Eady had decided that where land was exonerated from land tax at a time when it was in its ordinary normal condition as mere land, it was entirely exonerated, irrespective of the use to which it might in future be put. It was otherwise, however, where the land, at the date of redemption, was not in its ordinary normal condition, and special circumstances existed from which an intention to redeem a partial interest only could be inferred, as, for example, where the surface and open mines below were in different occupations and were separately assessed to the tax, and the price of redemption was arrived at upon the basis of one such assessment only. His Lordship further held that where the land tax had been redeemed on lands or houses abutting on a public street or highway the exoneration did not extend to the middle line of such street or highway. The railway company appealed. In the result the Court (Lord Justice Farwell dissenting) allowed the appeal.

The MASTER of the ROLLS, in the course of his judgment, said the question raised by the appeal was whether land tax was payable by plaintiffs in respect of so much of their tube railway as was beneath the half of certain streets in the City of London abutting on houses the land tax on which had been redeemed, it being agreed that land tax was not payable in respect of so much of the tube as was beneath the houses. The question was both difficult and novel. Land tax is charged upon all hereditaments of whatever nature or kind, and all persons "having or holding" any such hereditaments are to be charged with as much equality as possible by a £ rate. The tenants are required to pay the sums rated and to deduct out of the rent so much as the landlord ought to pay and bear. Where the tenant holds at a rack rent, the whole sum will thus be thrown on the landlord. When the tenant does not hold at a rack rent, the ultimate burden of the tax will rest on the landlord and the tenant according to their interests. Land tax may be redeemed according to the assessment and rate for the year. I agree that the only hereditaments exonerated by redemption are the hereditaments on which the tax redeemed was assessed. In my opinion this appeal should be allowed, the costs to follow the event.

Lord Justice KENNEDY delivered judgment to the same effect.

Lord Justice FARWELL disagreed, and delivered a lengthy judgment giving the grounds upon which he considered the appeal should be dismissed.

The appeal was allowed by a majority of the Court.

West Hartlepool Tramways.

An interesting question under the Tramways Act, 1870, was raised in the case of the Hartlepool Electric Tramways Co. (Ltd.) and Others *v.* the West Hartlepool Corporation, which came before the Court of Appeal (Lords Justices Vaughan Williams, Fletcher Moulton and Buckley) on Friday. (The proceedings in the original action have been reported in THE ELECTRICIAN.) Plaintiff company and Messrs. Sellon & Ashby, the promoters of a tramway undertaking in West Hartlepool, brought the original action claiming specific performance by West Hartlepool Corporation of a purchase agreement claiming £12,963, the sum fixed by an arbitrator as the value of the undertaking. Mr. Justice Bray gave judgment for the plaintiffs, holding that the original promoters were the owners of the undertaking, and that inasmuch as the Corporation had exercised their option to purchase, with notice that the transfer to the company had not been approved by the Board of Trade, they could not now be heard to say that the promoters were not the legal owners. The Corporation now appealed.

Mr. BALFOUR BROWNE, K.C., in support of the appeal said that his submission was that, inasmuch as the tramways were not constructed by the promoters, but by a company which had no authority either to construct or to work them, the provisions of sec. 43 of the Tramways Act of 1870 had not been complied with, and therefore neither the promoters nor the company had any legal ownership in or title to the undertaking. In those circumstances it would be ultra vires of the Corporation to purchase the tramways.

Lord Justice MOULTON: Is it your case that the Corporation ought to get these tramways for nothing?—No. It is that we cannot acquire a title.

Lord Justice BUCKLEY: You want to get out of your bargain?—We want the company to get out of the streets, because they are trespassers.

Lord Justice MOULTON: Then the tramways fall to you as the highways authority.—No, the company can take their tramways away.

Lord Justice VAUGHAN WILLIAMS reminded counsel that he was appearing for a public body, whose duty it was to act reasonably in the public interest. Was it right for the Corporation to rely upon mere legal technicalities?—It was entirely because he was appearing for a public body that he felt it necessary to press the point. The Corporation could only act according to statute, and if they purchased this undertaking when they had no right to do so, individual members of the Corporation would be liable to be surcharged. If the company would apply for a provisional order, and thus clothe themselves with the right which they at present did not possess, the Corporation were quite willing to pay for the undertaking.

Lord Justice MOULTON: The Board of Trade, apparently, have not objected to the assignment to the tramway company.—The Board of Trade have not given their sanction, and, therefore, the undertaking is not transferred to the company.

Lord Justice MOULTON: Then it belongs to the promoters.

Mr. MCCARDIE argued that the Corporation were not bound to perform the agreement of purchase under the Act of 1870. Replying to Lord Justice Moulton, counsel said the Corporation did not want to take the tramways, materials or rolling stock. They wanted the undertaking conveyed to them, but they did not want to have to take over the materials, rails, &c.

Lord Justice MOULTON said that it was really scandalous to suggest that because the company had made some irregularity in the formal transfer to themselves, the Corporation should have power to take the undertaking and not pay anything for it.

Mr. MCCARDIE said he was not there to argue points of municipal etiquette. The Corporation were not bound to take anything more than the statute compelled them to take. The Corporation were

Digitized by Google

entitled to insist on their right to have transferred to them only the powers to run trams.

Mr. DANCKWERTS, K.C., for plaintiffs, submitted that the consent of the Board of Trade was not necessary, but if it were, then, in fact, it had been obtained.

The Court intimated that they had heard sufficient.

Lord Justice VAUGHAN WILLIAMS, in giving judgment, said the case for the Corporation failed for two reasons. In the first place, certain correspondence which passed between the Assistant Secretary of the Board of Trade and the company was only consistent with the recognition by the Board of Trade of the company being the transferees of this undertaking. Moreover, no written consent was necessary in respect of the powers given by the Tramways Order, and inasmuch as there was an assignment from the promoters to the tramways company, and that assignment required no written consent, the company became themselves the promoters by succession. This diplomatic action, by which the Corporation desired only to purchase a portion and not the whole of the undertaking of the company, therefore failed. He did not think that any great harm was done by the failure of the action, but rather that it would be in the public interest.

Lords Justices Buckley and Moulton concurred, and the appeal was dismissed with costs.

Thermal Synd. (Ltd.) v. Silicaware (Ltd.)

Mr. Justice Swinfen Eady continued the hearing of this case last week.

Mr. W. R. BOUSFIELD, K.C., for the defence, said the view that defendants took was that the gas pressure in connection with the working of the silica had nothing whatever to do with it, except perhaps to some slight extent to modify the shape of the cavity. It was perfectly obvious if special conditions were necessary they must be given in order that one might know what they were. If, however, the conditions came by themselves and quite unaided and could not be helped, then of course there was no invention. It was not a good specification if things material and things immaterial were so mixed up that the vital conditions could not be elucidated. So far as elucidation of conditions went under which one was able to get the result which plaintiffs called initial separation—so far as that went, where was the information? Assuming that it was the gas which gave the result, he submitted that the specification of plaintiffs wholly failed, because it did not set out any of the necessary conditions to enable one to produce the result which plaintiffs said was vital. As a matter of fact gas pressure played a very secondary part.

Mr. O. DOLLMANN, secretary to defendant company, said he remembered his firm selling silica goods to Messrs J. & G. Cox (Ltd.) The order was received about April 5 or 6, and the goods were delivered on April 25 with the exception of a crucible. There was no explanation as to why the crucible was not sent. The defendant company was incorporated on Nov. 18, 1909. Witness denied that the company was formed with the object of selling goods acquired from Beule. He could not say when they first commenced selling silica goods, but it must have been the early part of last year. They were still selling such goods, and would continue to do so unless stopped.

Is it a fact that since you commenced the sale of these goods you have continued to import silica goods, advertise and offer them for sale?—Yes.

How long did you continue to obtain supplies from Beule?—We ceased all connection shortly after July last year. A small quantity has been purchased since the issue of the writ.

Mr. SCHUEN, formerly technical director of the smelting department of the works at Beule, said he knew an attack was made in Germany by the Beule Co. on the Thermal Synd. on the ground that the gas layer was a natural phenomenon, and that the patent for blowing out could not be supported because it was a natural phenomenon.

FDK. WILHELM KUEHUÉ said he held a qualifying certificate for an officer in the German Navy. His profession was that of an engineer and he was technical director to some large electrical works in Zurich. Witness had been requested to make some experiments in connection with this action which had been carried out after the English specification. The hollow in the centre of the silica tubes was produced by natural causes and was not in any way due to gas pressure.

Mr. JAMES SWINBURNE gave evidence as to the interpretation of plaintiffs' specification. He was of opinion that the sausage shape of the fused silica was determined by capillary attraction and though the gas pressure might help, he thought it would take up the same shape without the pressure. There was no suggestion in the specification of inflating the tube by generating gas.

Witness was cross-examined as to certain experiments with silica made by the plaintiffs.

Witness was then cross-examined by Mr. Walter.

Re-examined by Mr. BOUSFIELD: The presence of gas under pressure in the actual condition of working did not affect the size of the hole inside the sausage of fused silica. Witness considered the gas pressure had nothing whatever to do with the size of the hole.

Mr. COLEFAX then addressed the Court on behalf of the defence. He pointed out that the plaintiffs had not attempted to offer any evidence at all as to whether they had endeavoured to make silica ware in a furnace such as they now knew the articles in question were manufactured in. They admitted that they had got particular conditions, but did not ever attempt to put forward any evidence as to what in fact happened if one were to work with a furnace such as the furnace in which the infringing articles were made. The two furnaces were absolutely different. He would ask his lordship to accept the evidence of fact as put forward by defendants' witnesses. He (counsel) submitted that not only did defendants not infringe but the patent was bad on account of insufficiency, and also in some respects for want of utility. There was nothing before the Court on which his lordship could find that defendants had in any way manufactured articles in accordance with the plaintiffs' specification. Their case was based on a fallacy from start to finish. In order to establish that the defendants had infringed, plaintiffs must show that in the manufacture of the alleged infringing articles, the defendants enclosed the gas that was produced so as to facilitate the separation of the carbon core from the fused mass of silica. The evidence, as a matter of fact, clearly showed that instead of retaining the gas, the defendants deliberately allowed it to escape.

Judgment was reserved.

Factory Act Prosecution.

Charges arising out of the death of Mr. Wm. Middleton, assistant works superintendent to the Newcastle & District Electric Lighting Co., were heard at Newcastle on Friday last. There were five alternative charges, and Mr. Meynell, for the company, stated that he would plead guilty to the third charge, which alleged that the company had neglected to protect certain bare conductors so as to prevent danger as far as was reasonably practicable, and that in consequence, one Thomas Cox, suffered bodily injury. On this charge a fine of £50 and costs was imposed.

Charges Nos. 1 and 5 were withdrawn.

On charges 2 and 4 fines were inflicted, 20s. and costs in each case.

Charge No. 2 was similar to No. 3, except that the name of Mr. Middleton was substituted, and in No. 4 the name of Wm. Greenwood.

Mr. MUNDAHL (for the prosecution) said the case was brought under sec. 136 of the Factory and Workshop Act. On April 6, Mr. Middleton was killed in the performance of his duties at the Close power station. A screw on the switchboard was found to be out of order, and Cox and Greenwood had gone to the board to do some repairing. Apparently the spanner was not kept straight, for in some way a cross-connection was established, and a slight flash occurred, which resulted in both men being injured. About an hour and a half later, Mr. Middleton went to examine the switchboard, and there was a loud report and a flash, and, running back to the switchboard, Cox found Mr. Middleton with his clothes on fire. He was badly hurt, and the shock proved fatal. There had apparently been a complete and extensive flash between the two faces of the metallic brackets, with the result that the edges were fused. In this case, said counsel, it was obvious that precaution was not taken, because, if the inch of space between the two brackets had been insulated, as could easily have been, with a piece of marble or slate, the accident could not have happened.

Mr. MEYNELL said the accident was one no human being could have foreseen. No one had ever suggested that the apparatus was not safe. It was not a case of economy, or a wilful breach of the regulations.

The CHAIRMAN of the magistrates said the full penalty was £100, but having regard to the fact that the company's attention had not been specifically directed to the switchboard by the Board of Trade, and the neglect was not wilful, they had decided to impose a fine of £50 and costs.

It was stated that since the accident the company had installed a new switchboard at a cost of £200.

Tramway Rating.

At the Lancashire Chancery Court on Friday, Fleetwood Urban District Council applied for the dissolution of an injunction against the Council granted by the Vice-Chancellor in Jan., 1908.

Mr. FIRTH, for the Council, said railways were only liable to be rated on one-fourth of their ratable value and tramways on the whole. The owners of the tramway in question (the Blackpool & Fleetwood Tramway Co.) had been advised to contend that it was a railway and they served notice of appeal against their assessment on the Thornton Urban Council, in whose district one-seventh of the line was situated. The Court of Quarter Sessions dismissed the appeal and a Divisional Court took the same view, but the Court of Appeal allowed the appeal, Lord Justice Kennedy dissenting. The Thornton, Bispham and Fleetwood Councils agreed to take the case to the House of Lords, but in Jan., 1908, an action was begun by the Attorney-General against Fleetwood Council to restrain them from proceeding with the agreement and expending public money upon it, and at the trial on Jan. 21, 1908, the Vice-Chancellor ordered that the Council should be restrained from carrying out their part of the agreement. An appeal was made to the House of Lords on the assessment question and the decision of the Court of Appeal was confirmed, so that the Company had to pay on one-fourth of the ratable value. The costs of Thornton Council were taxed and settled, and if the agreement were carried out, Fleetwood Council would pay £515, of which £150 had been paid, leaving £365 to be paid, if they were permitted to carry out the agreement.

The ATTORNEY-GENERAL had directed a public meeting of ratepayers which had been largely attended, and at which any opposition which there might have been to the payment of the £365 had been due to the fact that the ratepayers had not been consulted before the agreement was sealed. A resolution was finally passed at that meeting that the £365 should be paid out of the rates. Counsel therefore asked for a dissolution of the injunction. The Attorney-General was in favour of the application.

The Vice-Chancellor's deputy (Mr. Taylor) made an order that, the Attorney-General and the plaintiff consenting, the injunction should be removed, but directed that the order should not be drawn up till Sept. 1 to give any ratepayer an opportunity to intervene if he wished.

His Honour said that if there was any intervention in the meantime the order would not be drawn up.

British Westinghouse Electric Mfg. Co. (Ltd.) v. Electrical Co. (Ltd.)

On Monday this case came before Mr. Justice Swinfen Eady. It was a patent action in which plaintiffs had succeeded and defendants now applied that the judgment be varied. The judgment ordered the delivery up to plaintiffs of arc lamps or parts of lamps in their possession and defendants asked that they should have the option, instead of delivery up, of destroying the lamps in the presence of plaintiffs or their agents. It was urged for defendants that where articles were made in infringement of a patent the property in the articles did not vest in the patentee, but remained in the person who had, though unlawfully, infringed the patent.

His LORDSHIP said the Court had jurisdiction either to order the delivery up of infringing articles or to order their destruction in the presence of the plaintiffs so as to prevent their being used. He had to consider what the order was that was made at the hearing. The plaintiffs asked for delivery up and the whole order proceeded on the footing of delivery up and defendants did not then ask for the alternative that there should be a destruction of the lamps or parts of lamps. It was, in his opinion, too late to ask for relief, and the motion to vary the order must fail.

Globe Electric Co. v. A. H. Brooking & Co.

In the City of London Court last Friday, before Judge Rentoul, K.C., plaintiffs sued Messrs. A. H. Brooking & Co., of Exeter, for £12. 15s. 8d. for six arc lamps supplied. It was said the order was given on July 22 last year, marked "Urgent."

The defence was that the lamps were never accepted and did not answer the description required, burning only intermittently. Defendants kept the lamps for four months before rejecting them, but it was pointed out that defendants had no opportunity of testing the lamps until four months after delivery. Carmarthen had no electricity supply available until then, and they could not be tested.

Evidence for the defence was given, and Mr. R. WARD, manager of the Carmarthen Amusements (Ltd.), said the lamps were unsatisfactory.

Judge RENTOUL, K.C., said that keeping the lamps for four months was fatal to defendants, and he found for plaintiffs, with costs.

Electric Lamp Trade Mark.

Yesterday (Thursday) Mr. Justice Warrington heard an application by Pope's Electric Lamp Co. (Ltd.) to be allowed to register the name "Pope" in connection with their incandescent lamps. The Board of Trade referred the question to the Court.

Mr. A. J. WALTER, K.C., said there was a large body of evidence that the word "Pope" had for many years been understood to indicate the applicants' goods.

The ATTORNEY-GENERAL (for the Board of Trade) asked the Court not to allow the name of a manufacturer to be deemed a distinctive trade mark.

His LORDSHIP said if the name of a manufacturer was not in its nature adapted to distinguish his goods from those of another manufacturer it could not become adapted by any amount of user. He must refuse the application.

Rating of Urban Railways.

At the County of London Sessions recently the chairman (Mr R. Wallace, K.C.) gave judgment in the appeals of the Great Western and Metropolitan Railway Companies against the Hammersmith and City Joint Line assessment in the parishes of Kensington and Hammersmith. Judgment was entered for the companies, with costs, reducing the rateable value of the railway in Kensington from £1,950 to £60, and in Hammersmith from £4,890 to £100. It was stated that, as a result of the competition of the tube railways, tramways and motor-buses, the Hammersmith and City line had now by the usual parochial method of valuation no rateable value, but the rating authorities contended that it had a contributory value as a feeder to the Great Western and Metropolitan systems, and that that was sufficient to support the assessments appealed against. The Court declined to accept this view, but offered to state a case for the High Court.

Electrically Operated Clocks.

At Westminster (London) County Court on Monday Miss Blackwood was awarded £25 damages and costs against John Walker (Ltd.), clockmakers, late of New Bond-street, for breach of contract.

Miss Blackwood said she was a member of the congregation at St. Columba Church, Pont-street, and presented a set of clocks to the church. Messrs. John Walker (Ltd.) undertook to fix three clocks in the turret of the church, a fourth in the pulpit, and three others in other parts of the building, all to be regulated electrically. The clocks acted satisfactorily for a time and then began to behave in a very eccentric manner, the dials registering different hours, and on one occasion one of the clocks was seven hours slow. Miss Blackwood consulted Mr. Hope Jones, and he took the matter in hand, with the result that the clocks afterwards kept satisfactory time. Mr. Hope Jones's charges amounted to £41. 2s. 6d., which Miss Blackwood paid, and this was the sum now claimed from Messrs. Walker, who had guaranteed the clocks for 20 years.

The defence was that the clocks were not at fault except when the works became affected by dust created by building operations and by severe weather freezing the oil.

Municipal Electricity in Islington (London).—On Friday the Lord Chief Justice and Justices Lawrence and Avory heard an application by Mr. Cecil Walsh for a rule nisi for a mandamus, on behalf of London County Council, to Islington Borough Council calling upon them to show cause why they should not have five testing stations to their electric lighting undertaking in accordance with the County Council's Regulations. After a statement by Mr. Walsh that Islington Council had been notified of the County Council's requirements as far back as July, 1907, the rule was granted.

PATENT RECORD.

APPLICATIONS FOR PATENTS.

*NOTE.—The undermentioned Applications (except those marked †) are not open to public inspection until after acceptance of Complete Specifications. Those marked * are open for inspection 12 months after the date attached to them, if they have not been published previously in the ordinary course. Names within parentheses are those of communicators of inventions. When complete Specification accompanies application, an asterisk is affixed.*

COMMERCIAL AND INDUSTRIAL SECTION.

MUNICIPAL, FOREIGN & GENERAL NOTES.

BRITISH NOTES.

Bacup-Rochdale Tramways.—The electric tramway from Bacup to Shawforth, constructed by Bacup Corporation at a cost of £24,000, was completed on Saturday, affording facilities for a through service from Bacup to Rochdale.

Birmingham.—In presenting the report of the Tramways Committee at the City Council meeting on Tuesday the Chairman (Mr. Harrison Barrow) moved:—

That the committee be authorised to enter into an agreement with the City of Birmingham Tramways Co. (Ltd.) for the purchase for £151,500, of the whole of the interests of the company and of the British Electric Traction Co. (Ltd.) in the tramways in Aston Manor, King's Norton and Northfield and Yardley, with the rolling stock (except 21 cars), lands, buildings, generating stations, appliances and apparatus in connection therewith, including the payments due from the Corporation in respect of rolling stock, &c., in connection with the Bristol-road tramway route and from the King's Norton and Northfield Urban District Council in respect of the rolling stock, &c., in connection with the Pershore-road tramway route.

Mr. Barrow said the Council now had the opportunity of getting control of and working the whole of the tramways in the district. The trams along the Handsworth route, the Bristol-road trams in Birmingham and the Pershore-road trams in King's Norton also came into the hands of Birmingham and King's Norton and were being worked by Birmingham, by arrangement with King's Norton and Handsworth. The company were, therefore, now left with the portion of the Bristol-road route in King's Norton running to Selly Oak, the Aston trams, and the trams in Yardley along the Stratford-road and Coventry-road. King's Norton had given notice to purchase their portion of the line from the present city boundary to the end of the Selly Oak line. The company would, therefore, shortly be left with only the Yardley trams to make a profit out of, so that it was obvious there were great advantages both to the Corportation and the company for the Corporation to purchase the interests of the company. A figure had been arrived at which the committee considered fair, and which they unanimously recommended the Council to accept. The acceptance would have to be confirmed by the Greater Birmingham Council. He recommended this purchase with every confidence, and felt cetrain it would be confirmed by the Greater Birmingham Council without hesitation.

Ald. Beale said sooner or later they would have had to purchase the whole of the Yardley system on arbitration terms, under the Tramway Acts, and the whole of the King's Norton system beyond Bournbrook to Selly Oak. Each would involve the purchase of valuable power stations which they would rather be without. Ultimately it had been agreed that the round sum of £150,000 would be fair to both. What they would earn from the Yardley tramways would not pay interest and sinking fund on the money they were spending, and they were in exactly the same position in regard to King's Norton and Handsworth. But they were fortunate in getting a good deal of what, at all events, was a going concern. They were getting the Bristol-road route which was equipped, and the Stratford-road route, which were the city end of routes that might be made remunerative. There was no reason to doubt that the extension along the Stratford and Warwick-roads would bring the Yardley system into a very remunerative concern. They had to face the fact that they had locked up some capital, but it would come back to them.

The motion was carried.

The Council then considered the Tramway Committee's proposal for the extension of existing tramway routes and the linking-up of routes in the centre of the city, and also a recommendation for the promotion of a bill in Parliament to enable the committee to undertake this work.

Mr. Barrow said he believed tramway development in Birmingham was still in its infancy, although they were now taking £400,000 per annum. Liverpool was taking £600,000, Manchester £800,000, Glasgow £1,000,000, and it seemed to him that they ought not to rest content until they had approached those figures.

Ald. Sir J. Smith moved that this part of the committee's report be deferred for further consideration. He pointed out that Hill-street (in which it was proposed to construct a tramway) was only 25 ft. 6 in. wide, and the margin between the body of a tram and the kerb of the gutter was only 5 ft. 6 in. Almost all vehicles were more than 5 ft. 6 in. wide. The new scheme would make the congestion in Navigation-street worse than at present. He had submitted another route which he thought might be at any rate partially accepted.

It was agreed to adjourn the proposal for the promotion of the bill for the construction of the extensions till Oct. 7.

On the motion of Mr. Harrison Barrow the committee were authorised to proceed with the erection of a new tramway depot at Hockley Brook, at an estimated cost of £33,000; it was also decided to instruct the Finance Committee to borrow £20,110, the estimated cost of converting the cable tramway in Handsworth to electric overhead construction.

The report of the Tramways Committee, with the exception of the portion adjourned, was then approved.

Brecon.—The Council have received formal notification from Mr. J. H. Edwards that he will apply for a provisional electric lighting order.

City and Guilds (Engineering) College.—On the report of the delegacy charged with the management of the City and Guilds (Engineering) College, the Council of the City and Guilds of London Institute have awarded the diploma of "Associate of the City and Guilds of London Institute" to certain matriculated third year students of the City and Guilds College who have completed a full course of instruction as prescribed by the Council. These diplomas include 56 which have been awarded for civil and mechanical engineering, the Brammell Medal being gained by Mr. G. O. C. Reilly. Thirty-one are awarded in electrical engineering as follows:—Messrs. A. H. Barrett (Siemens Memorial Medal), W. B. Bacon, W. E. Barker, A. S. M. Best, M. de Castro, S. N. Chopra, C. A. Claremont, H. J. Eley, E. P. Elworthy, C. F. Freeborn, C. L. Hall, N. P. Hinton, T. J. Hornblower, A. N. Kingsbury, W. H. Lovell, A. A. Maytham, B. McCormick, T. E. de Morsier, W. W. P. Page, E. Potter, S. M. Rawson, A. Riddle, H. W. D. Rock, P. G. Ryder, C. W. Saunders, G. F. R. Schmidt, G. J. Scott, R. W. Shackell, W. Still, C. Vandermin, while 10 are awarded in chemistry.

Clitheroe.—Mr. J. W. Speight has notified the Council of his intention to apply for a provisional electric lighting order for Clitheroe.

Douglas (Isle of Man).—A special committee has been appointed to consider and report upon the question of electricity supply for the district.

Dover.—The Corporation on Tuesday decided by 7 votes to 5 to refer back a recommendation of the Electricity Committee that the salaries of the chief engineer of the electricity department, Mr. Woodman, be increased from £425 to £475; that of Mr. Harpur, mains superintendent, from £200 to £225; and that of Mr. E. W. Smith, works superintendent, from £200 to £225. Mr. Chitty, who moved that the recommendation be not entertained, said he did not say the officials were not deserving of the increase but he thought the salaries were so adequate that they would be wrong in increasing them.

Edinburgh.—Edinburgh Tramways Committee have decided to recommend the Council to appoint Councillors Rusk, Rawson and Stewart and the burgh engineer, Mr. Campbell, to inspect the rail-less trolley traction system at Leeds and Bradford, with a view to amplifying a report prepared by Mr. Campbell, in which he points out the economy of the system compared with ordinary electric tramways and cable tramways. He thinks the system would be applicable for use in Fountainbridge and other narrow thoroughfares in the city, and also for extensions into the country.

Grimsby.—At a meeting of the Electric Lighting Committee last week Mr. Hobbs suggested a reduction of the charge for current to private consumers from 3¾d. to 3¼d., and the electrical engineer, Mr. W. A. Vignoles, is to report on the matter.

Guisborough.—At a recent meeting of the District Council an offer of the gas company to continue to light the public lamps for one year at 39s. 6d. per lamp, or for three years at 37s. 6d., was submitted.

A petition was also received from 400 residents in favour of the adoption of electric lighting, and suggesting that current in bulk be obtained. *Adjourned.*

Hammersmith (London).—The Finance Committee of London County Council have decided to grant the loan of £24,175 asked for by the Borough Council for additional plant.

Haslingden.—The Council have received sanction to a loan of £8,188 for mains, services, motors, meters and sub-station equipment.

Hastings.—The Council last week decided, on the recommendation of the Railways and Tramways Committee, not to accede to the proposal of the local tramway company to substitute the overhead system for the surface contact system of traction on the local tramways. The Council also declined to grant the request of the company that the wayleaves be continued at £50 per mile instead of being increased to £75 per mile.

Honiton.—Last week the Council adopted a recommendation to enter into an agreement with Dr. Purves, of Exeter, for supplying electrical energy for lighting the town.

Huddersfield.—The salary of Mr. J. W. Turner, chief electrical assistant in the Corporation electricity department, has been increased from £185 to £200.

Digitized by Google

Inquest.—An inquest was held on Tuesday into the death of Arthur Street, chief assistant engineer, Corporation Electricity Works, Batley, who (as stated in another column) died on Monday from injuries received in a motor-bicycle collision at Alwoodley.

Mr. A. B. Chappell, electrical engineer, Batley, said that he and Mr. Street started together with the intention of cycling to Harrogate. At Harewood Bank witness pulled up at the back of a taxi-cab, thinking a vehicle was overtaking him. Street then ran into the back of his machine and both riders were thrown from their machines. When witness recovered he found Street lying unconscious. No one saw the accident.

Dr. Richardson, of Leeds Infirmary, said death was caused by an extensive fracture and laceration at the base of the skull.

The jury returned a verdict of accidental death.

Llandudno.—On Friday the Council decided, by the casting vote of the chairman, to reduce the flat rate for electricity supply from 5d. to 4½d. per unit.

London, Brighton & South Coast Railway Co.—Public announcement is made of this company's intention to extend the electrification of their line from Balham to Croydon, via South Norwood, within the next year.

London County Council.—At the meeting on Tuesday it was agreed, on the recommendation of the Finance Committee, to loan £5,260 to Stepney Council, repayable in 50 years, for the erection of an electricity sub-station.

Motor Vehicles for Fire Brigade.—The Fire Brigade Committee reported that they were anxious that the motor-driven fire engines and escape vans (including one electrically-driven turntable long ladder), for which the Council had invited tenders, should be ordered before the summer recess, and they asked the Council to authorise them to open and accept tenders, and the Council adopted this course.

New Tramways.—The Highways Committee submitted a report containing proposals for the construction of seven new tramways. The following are the proposed new lines: (1) Hampstead-road to King's Cross via Euston-road; (2) Charles-street to a point north of Ludgate-circus via Farringdon-road and Farringdon-street; (3) Norton Folgate to near Liverpool-street via Bishopsgate; (4) Tooley-street, from the existing terminus to near London Bridge; (5) Catford to Southend via Bromley-road; (6) Essex-road to Kingsland-road via Englefield-road and Stamford-road; and (7) Wood-lane to Harrow-road via a new road between Wood-lane and Latimer-road, thence via Walmer-road, Silchester-road, Clarendon-road, Cornwall-road, Westbourne Park-road, Porchester-road and Lord Hill's bridge. The total length of new lines proposed is 11 miles 6·4 chains, and the estimated cost of construction and equipment is £226,500. The first six new lines are to be on the conduit system and the last on the overhead.—Consideration of the report was postponed.

L.C.C. Annual Report.—The report of the London County Council for 1909-10 was issued last week.

Statistics of the various departments of the Council are given. They would be of more interest if they were issued more promptly. There were 134 miles of tramway in working order at March 31, 1910, and a good deal of reconstruction was done in the 12 months, and horse-traction lines were reduced from 42½ to 17¼ miles. The work of electrification has been continued. The number of passengers carried on the tramcars were 451,439,216 during the year, of which nearly 25 per cent. was represented by ½d. and about 47 per cent. by 1d. fares. The income of the tramways department was £2,023,003, and the working expenses were £1,233,967, leaving £789,036, but after providing for interest, repayment and income tax, the profit was £192,108, of which £132,230 was carried to renewals fund and £59,878 to reserve. The net debt outstanding on tramways account was £8,899,098.

Marylebone (London).—The rate per unit charged by the Council for current for contractors' showrooms is 2d. per unit, but in return for displaying current-consuming devices other than lamps the charge is to be reduced to 1d. per unit.

The Electricity Committee have approved suggestions by Mr. Seaton in regard to hire of wiring and inclusive charges per quarter for installation, maintenance and current. An agreement for three years is required, by which time the cost of wiring is repaid by the consumer and it becomes his property, and that this kind of wiring shall be done entirely to contractors; that with regard to the loan of apparatus to trade contractors be offered any apparatus which their customers desire to try on the same conditions as the Council's representatives loan such apparatus to consumers, and if the contractors' customer purchases the apparatus the department will sell it to him at trade price. The bonus payable to the general manager and chief officers of the department amounts to £787. 19s. 10d. for the year ended March 31 last. The conditions under which this bonus was granted were that the sales of electrical energy were to exceed those of the previous year by 500,000 units (the actual increase was 1,560,497 units), and the average price charged for both private and public supplies was to be diminished by not less than 5 per cent. on the previous year's average. The actual decrease was 0·387d. per unit, or 10·73 per cent.

Melrose (N.B.).—The Electric Supply Corpn. propose to erect an overhead electric lighting cable to Gattonside.

Millfield.—At the last meeting of the District Council Mr. Berry suggested that trackless trolley vehicles might be run in the district, the Council obtaining an Act and borrowing the necessary money. The discussion was adjourned.

Oldham.—At the meeting of the Electricity Committee last week a deputation from the Chambers of Trade attended, and complained that the Corporation electricity department were trading to private traders' detriment.

Mr. BUCKLEY (secretary of the Chamber of Trade) asked under what power the Electricity Committee were hiring out motors.

The TOWN CLERK said they only hired out motors through a contractor. The firm was not a local one, and was not on the list shown at the station.

Mr. BUCKLEY said he considered the Committee had sought to take business out of local firms' hands. Their grievance was that the Committee were supplying motors after an understanding that all orders should be referred to any members of the electrical section of the Chamber of Trade whose names were on the list. The members of the electrical section were willing to supply motors on the simple hire system as well as the purchase system.

The Committee promised the deputation that if the latter adopted the hire system and made it known the Committee would do nothing in the sale or hire of motors.

Poplar (London) Electric Showrooms.—On July 14 the Mayor of Poplar (Coun. F. Sedgwick) formally opened the Borough Council's new showrooms at 121, East India Dock-road.

Coun. H. R. BARGE, who introduced the Mayor, referred to the remarkable progress made by the electrical department under the management of the borough electrical engineer, Mr. J. Horace Bowden.

We have received a copy of a local paper which describes with unstinted praise the demonstrations (on the occasion referred to) of cheap, quick and excellent cooking, which were given by Mr. F. S. Grogan (of the Berry Construction Co.). These excellent results were the more praiseworthy because, as the local reporter remarks, "when it is remembered that he (Mr. Grogan) is entitled to place after his name the letters A.M.I.C.E. and A.M.I.E.E., one may gather that he has not had time to take cookery lessons."

Portsmouth.—The net profit on the municipal tramways department for the past year was £6,000, on the electricity supply department £4,500, and on the telephone department £500. Each undertaking has a large reserve fund, and the three together will contribute £9,500 in relief of rates. The electric light reserve fund has reached £29,000, this being equal to the limit of 10 per cent. allowed by Parliament.

Pwllheli.—It is stated that electricity works for lighting the town will be erected shortly.

Rawtenstall.—The Council have received sanction to a loan of £15,650 for their electricity department.

Rishton.—Mr. J. W. Speight has notified that he will apply for a provisional electric lighting order.

Sheffield.—A deputation asked the Tramways Committee on Tuesday to seek powers to run trackless trolley cars to Dronfield. The committee is considering the suggestion.

Stepney (London).—The Electricity Committee suggest that in future they should pay the equivalent of 0·23d. in stead of 0·4d. per unit for steam obtained from the destructor and the Works Committee have signified agreement to the reduction.

Stockton-on-Tees.—The Council decided on Friday to adopt the following scale of charges for electrical energy for power:—

Below 150 units per quarter 2d. per unit, 150 units and above 1½d., 500 and above 1¼d., 5,000 and above 1¼d. and 20,000 and above 1d., with the option of a special arrangement in the case of the larger consumers. The difference in revenue upon the present consumption would amount to £191.

Swansea.—An experiment with the restricted hour system of supply is being made by the Corporation electricity department and the electrical engineer (Mr. C. A. L. Prusmann), and the chairman and vice-chairman of the Tramways and Electric Lighting Committee will prepare a report.

The Council last week adopted a recommendation of the Tramways and Electric Lighting Committee that the profit of £8,062. 8s. 6d. on the past year's working of the undertaking be placed to reserve.

Telephone Charges.—The Association of Urban District Councils passed a resolution on Saturday to ask the Postmaster-General, in view of the favourable terms granted to agriculturists, to reduce the charge for telephones, especially in the case of subscribers resident in small urban districts, who only require a very limited number of calls annually.

Telephone Wayleaves.—In the course of correspondence on the subject, the Postmaster-General has informed the secretary of Dudley Chamber of Commerce that the rights of the Post Office as to erecting telegraph and telephone lines on or over private lands differ from those possessed by the National Telephone Co., that some of the privileges of the Post Office in this direction are conferred by special acts and some by common law, and that he con-

Digitized by Google

siders it is well known that he does not possess or exercise any powers with regard to telegraphs and telephones which are oppressive or unfair to owners or tenants of property. The withdrawal of wayleaves granted to the National Co. can but inconvenience subscribers.

Truro.—The Council are in communication with Mr. Swarbrick as to an electricity supply scheme.

Watford.—The price of electric energy for cooking purposes is to be reduced to 1½d. per unit.

The Council have decided to engage Messrs. Robert Hammond & Son to prepare a report on a scheme of extensions of the electricity works.

West Ham.—Sanction to the borrowing of £2,925 for extension of cables in connection with the tramway system has been obtained.

West Hartlepool.—The L.G. Board inquiry into the application by the Corporation for sanction to borrow £38,000 for extension of the electricity undertaking was resumed last week.

The Corporation propose to utilise exhaust steam and waste heat at the Seaton Carew Iron Co.'s blast furnaces and to erect a power station adjoining the ironworks. The company, in return for their waste steam, are to have a supply of current free. The Cleveland & Durham Electric Power Co. who, it is stated, desire to obtain the use of the waste heat from the iron company, opposed the scheme.

Capt. D. R. Sankey, for the Corporation, admitted that it would be the first Corporation to generate electricity by means of waste heat, but denied that the scheme was an experiment.

Mr. J. F. C. Snell said if the Corporation were not in a position to maintain a proper and safe supply under the Durham & Cleveland Power Co.'s Act they could fall back on that company, who would be bound to supply them.

Mr. Clode (for the Corporation) produced a letter intimating that the North Eastern Railway Co. were offering no further opposition.

On behalf of the Cleveland & Durham County Electric Power Co., Mr. C. H. Merz said he was, so far as he knew, the first to design a waste heat station. Waste heat plant was not in itself sufficient for any public supply. It should be supplemented by coal fire plant with fires always burning. A waste heat station should always have a stand-by plant to counteract irregularities, and it would be better to put down a new modern coal station than the proposed complicated system of waste heat and coal fires. He had found in working waste heat stations that the variations were such that the system would be unreliable for public supply.

Mr. T. Terrell (for the Power Co.) said the Corporation had not in their scheme any effective supervision for dealing with deficient supply. On the other hand, the Power Co. had a large number of stations all linked up together.

Mr. Clode said, assuming that there were temporary interruptions in the supply of waste heat for short periods, the combination of gas firing and coal firing was already in use, and to-day any deficiency in exhaust steam was made up by coal firing.

The inquiry then closed.

Willesden.—The Electrical Engineer has been authorised to make arrangements to supply current at a substantial rebate to contractors in the district who make a good show of apparatus belonging to the Council or who advertise the Council's electricity undertaking.

Outing.—A number of the staff and employés of Gloucester Corporation tramways department, including the general manager, Mr. L. Johnson, had their annual outing to London on Tuesday last week.

COLONIAL AND FOREIGN NOTES.

Australasia.—The "Australian Mining Standard" says North Bulli Coal Co. (Clifton, N.S.W.) are installing new machinery, including electrical plant.

Coleraine (Victoria) Butter Factory Co. propose to instal electric lighting plant at their works, and to supply current for public and private lighting. Wannon Shire Council are willing to agree to a 10 years' concession.

Temora (N.S.W.) Council recently decided to engage Mr. J. E. Donoghue (Balmain) to prepare a report and estimate of the cost of electric lighting plant.

Daylesford (Victoria) Council have decided to borrow £4,000 for establishing electricity works.

A company is being formed at Ararat (Victoria) with a capital of £6,000 to carry out an electric light and power scheme for the town. Messrs. Lincolne & MacDougall have prepared a report, and they calculate that the capital expenditure will be £5,758, annual expenditure £1,170 and annual revenue £1,340. A majority of the Council have adopted the report.

About a year ago a conference of local Councils appointed a committee to consider the question of establishing hydro-electric works to utilise water power at Wairua Falls and supply current in Whangarei. The committee obtained a report from Mr. S. Irwin Crookes, which showed that for an outlay of £50,000 the falls could be harnessed and 1,500 H.P. generated. The Government are having the falls surveyed. Mr. Laurence Birks has charge of the work.

Austria-Hungary.—Reichenberg municipal authorities have decided to construct a tramway 3½ miles in length, from Tuchplatz to Hanichen and Ober Hanichen, at a cost of £27,000. A project for a rail-less trolley system to Heimstatel (Ober Hanichen), at a cost of £14,500, is to be considered.

Brazil.—The "Financial Times" states that on June 26 the Committee of Public Works appointed by the House of Representatives to investigate the petition of the Compagnie Bresilienne d'Energie Electrique for permission to lay down underground cables for supply of electric power for public and private purposes in Rio de Janeiro, have approved the company's scheme. It is also stated that the company have signed a contract with the municipality in regard to the matter. The committee of Public Works recommend the passing of a Parliamentary Bill stipulating that the period of the concession shall be 60 years, that the supply of current for private lighting shall only be available after Sept. 15, 1915, that the charge for lighting shall not exceed 100 reis (paper) per unit, and that the concession shall grant no monopoly, the Government reserving the right to grant concessions at all times for free competition.

China.—A report from Wuchow says there is a tendency for the Chinese to organise companies to exploit the province. Schemes recently started include electric lighting at Wuchow and a telephone system at Kueilin.

Reports state that the Chenghai-Swatow tramway scheme, which was to have been carried out with Chinese capital, has been abandoned.

Imports to Tientsin in 1910 included electrical material and fittings valued at £17,511 (compared with £19,515) and machinery £11,571 (against £49,404).

A company was formed to supply electricity in Hankow, but nothing further was done until the authorities arranged that half the capital should be supplied from official funds and that the company should be administered under official supervision. The scheme now seems likely to eventuate, and some machinery has been obtained through a foreign firm in Shanghai.

Exhibition.—An international agricultural and industrial exhibition is to be held at Rostov-on-Don (Russia), from Sept. 23 to Oct. 14. The British vice-consul at Rostov suggests that power plants, turbines and hardware of all kinds might be usefully shown. The prospectus (in Russian) may be seen at 73, Basinghall-street, London, E.C.

Japan.—The Japanese National Budget for 1911-12 provides for expenditure of £7,000 for the investigation of wireless telegraph, £42,000 on the Great Exhibition, £613,000 for telephone extension and £27,000 for the investigation of hydro-electricity.

The Supplementary Budget for Korea provides for expenditure of £31,000 on telegraph and telephone construction and £868,000 for railway construction and improvement.

Madagascar.—A consular report states that the city of Antananarivo has been provided with electricity supply during 1910.

New York.—On Friday last the Board of Estimate awarded the contracts for the construction of 88 miles new underground and elevated railways in New York to Brooklyn Rapid Transit Co. The capital expenditure by the City will be $206,800,000 and by the company $71,400,000. The work is expected to begin in 30 days.

Russia.—A consular report from Moscow says there was a very considerable increase in the use of electrical energy in Russia in 1910, and in the manufacture of machinery for generating electrical energy. The greatest increase was shown in the output of Diesel engines. Owing to the increasing needs of municipalities, factories turning out cables, tramway and telegraph fittings, &c., extended their business, the spirit of activity being particularly apparent in provincial towns such as Orel, Tamboff, Kaluga, Smolensk, Minsk, Tula and Moghileff, in each of which there are important municipal projects.

The British Vice-Consul at Moscow states that on a tour of inspection towns in the west and south of the Moscow district he found that British commercial enterprise was conspicuously lacking, whereas German commercial travellers were well known visitors in the provincial towns, and German price lists, drawn up in Russian, were widely distributed. It is suggested that several non-competing firms should combine to open depôts to introduce British goods.

The Vice-Consul at Krasnoyarsk says that trade in British goods has been small, although a considerable trade might be done in tools and hardware. German firms have travellers all over Siberia, and successfully compete with British firms by doing business on local terms, giving six months' credit. Electrical and agricultural machinery and machine tools should find a good market.

The Vice-Consul at Tammerfors (Finland) says British manufactured goods would command a greater sale in the district if travellers knowing the Swedish language were sent out. There have been for many years regular imports of British machinery for textile mills.

It was decided to considerably extend the generating plant of Viipuri with a view to the supply of electricity for a proposed municipal electric tramway.

Imports at Hangö (Finland) included electrical machinery valued at £1,100.

Reports from the Batoum district state that British capitalists might find in the Caucasus an enormous field of operation for commercial exploitation. The region is rich in metals and the laws governing gra-

Digitized by Google

of concessions for prospecting and development are not irksome. Most towns require electric light, waterworks and drainage schemes, and the many existing traction and other projects give the capitalists further opportunities. The Government are considering the manufacture of ferro-manganese either by electric furnace (using water power for the generation of energy) or by the ordinary blast furnace.

Spain.—A scheme has been brought before the Cortes for the extraordinary expenditure of 60,000,000 pesetas on port works during the ensuing five years. Of this sum 800,000 pesetas (£31,667) is required for 16 electric cranes for Barcelona.

Wireless Telegraph Note.—It is announced that a project is under consideration to establish wireless telegraph communication between Paris and all French possessions in Africa.

ELECTRICITY SUPPLY AND TRAMWAY ACCOUNTS.

Bootle (Lancs.).—The report of the borough electrical engineer (Mr. T. D. Clothier) states that as a result of the working of the electricity department for the year ended March 31 there was a record surplus.

After paying all expenses, including interest and sinking fund, providing £2,300 as a contribution towards depreciation, obsolescence and renewals, £150 for accumulator repairs' account, £1,500 was voted in relief of rates. There was every indication that the set back to the output due to the introduction of metal filament lamps had disappeared, and with the increased output this year there had been an increase in the maximum demand. There was a steady demand for current. There were 755 consumers, but in many cases they were only using a partial supply. Motors of 2,533 H.P. are connected, but users of over 9,000 H.P. are being served by steam and gas engines, and most or all of these users might wish to change as their present arrangements got older. That process would take place sooner if electricity were sold at a lower price. The percentage of gross profit was 8·83 per cent., but it was 13·6 per cent. on the outstanding capital, which was now £74,254. The entire revenue only amounted to 17·8 per cent. of the capital expenditure, so that careful management was required to leave any surplus.

Bristol.—At the City Council meeting on Tuesday the Electrical Committee submitted the accounts for the year to March last.

Revenue was £84,435 and working and general expenses £36,001, leaving gross profit £48,434. Adding £85 refunded on adjustment of income tax and £172 transferred from redemption and sinking fund account, there is a total of £48,891 available for dividends on stock, interest on loans, &c., repayment of capital, reserve for renewals (£3,042), stores written down (£752), expenses re Exchange premises. A deficiency of £768. 16s. 4d. is shown, which will be met from unappropriated balance in hand (£4,042), as will other sums properly chargeable to capital account but for which loans have not been sought, after which there will remain a balance of £2,628. 7s. 9d. to carry forward. The total amount borrowed for the undertaking is £831,365, of which £209,753 has been repaid or accumulated for repayment, and there is also in the reserve fund £23,490. 5s. 11d. There are 3,586 consumers (increase 198), and the connections to the mains are equivalent to 551,991 30-watt lamps (compared with 521,124 last year). Units sold were 9,034,709 (increase 892,333).

The report of the electrical engineer, Mr. H. Faraday Proctor, states that the use of metal filament lamps is still operating to the advantage of the consumer, as shown by the revenue derived from the lighting supply during the past four years, viz., 1908, £47,447, 1909 £43,416, 1910 £40,779, 1911 £41,543. Thus, although the light supplied for the past year is enormously greater than that supplied in 1908, the consumption in units to produce this increased light diminished to such an extent that consumers in the aggregate have paid £6,000 less.

Ald. PEARSON in presenting the accounts on Tuesday said: The gross profit had increased to a greater extent than the income, and that was explained by the fact that there had been a considerable reduction in the cost of generation. They had now paid out of revenue £209,752 to the sinking fund or repayment of mortgage, so they had either mortgage or money in their pockets to that extent. They had also put aside £23,000 for renewals.

The accounts were adopted.

Broughty Ferry.—The accounts of the electricity department show capital expenditure £19,719 (increase £517), of which £16,463 remains outstanding.

Revenue was £2,353 and working and general expenses £1,122, leaving gross profit £1,231. After meeting capital charges, £104 was placed to reserve, and £52 applied to writing off suspense account balance. The units generated were 151,305 (compared with 151,359 in previous year), supplied to public lamps 16,102 (18,627), by contract 998 (1,032) and to private consumers by meter 102,077 (97,479). Total maximum demand 92 kw. (90 kw.).

Cardiff.—At the meeting of the Electric Tramways and Lighting Committee last week Mr. John Allcock (city treasurer) explained the tramway and electricity supply accounts for the year ended March last.

In the tramways department the total capital expenditure was £780,920, and £176,777 had been repaid or set aside for redemption. Traffic receipts during the year were £116,806 (against £114,306 in previous year). Revenue from advertising in cars was £2,010 (£1,879), and energy supplied to the electric lighting department produced £16,351 (£14,188), making a total income of £136,394 (increase £4,829). Working and general costs were £76,441 (increase £2,063), gross profit £58,952 (£56,187). The net revenue surplus was £12,033 (increase £1,001), of which £6,946 has been placed to depreciation and £5,087 to reserve.

Capital expenditure on the electric lighting department was £272,250 (increase £3,820), and net liability on loan account now stands at £207,866.

Income during the year was £45,455 (increase £2,259), working costs were £27,638 (decrease £470), gross profit £17,817 (increase £2,730).

Hammersmith (London).—The accounts of the electricity department for the year ended March show capital expenditure £322,269 (increase £5,643), of which £77,847 has been repaid.

Revenue was £64,376 (against £53,433 in previous year), gross profit £33,940 (£25,155) and net profit £11,997 (£3,483). The maximum load was 5,520 kw. (4,653 kw.). Units generated 10,787,120 and purchased 584,898. Units sold by meter to private consumers were 8,455,695 and to public lamps 784,317. There are 191 arcs, 61 small arcs and 5,719 incandescents for public lighting. Average price obtained for public supply was 1·24d. (against 1·50d.) per unit, and for private supply 1·61d. (1·69d.). There are 2,800 (2,577) consumers, and the motors connected are 434 (=4,901 H.P.), against 386 (=4,587 H.P.).

Maidstone.—At the Corporation meeting last week the Electricity Committee submitted a report by Mr. A. W. King on the electricity supply undertaking.

The report stated that capital expenditure during the year ended March was £1,951. 9s. 11d., revenue £13,642, gross profit £5,817. 13s. 4d., but interest and instalments of loans required £5,976. 9s., leaving a deficiency of £158. 15s. 8d., which has been charged against the unappropriated surplus from previous year, reducing this to £598. 4s. 5d. The report was adopted.

Mr. King's report on the tramways stated that £1,675 was raised during the year for capital expenditure and £1,000 was expended in connection with cars.

Revenue was £9,340. 14s. 1d., and working expenses £7,091. 9s. 5d., leaving £2,249. 5s. 8d. gross profit. Interest and loan charges were £4,932. 6s. 8d., so that there is a deficiency of £2,623. 7s. to be charged to the borough fund.

Weymouth.—The accounts of the Weymouth and Melcome Regis electricity undertaking for the year to March last show capital expenditure £54,255 (increase £2,223), of which £8,160 has been repaid or provided for repayment.

Revenue was £7,011, gross profit £3,878, net profit £376. There are 540 consumers (against 420 at March, 1909), and the equivalent 33 watt lamps connected are 33,176 (28,778). Motors aggregate 187 H.P. The maximum load was 395 kw., and the combined load factor was 12·92 per cent. (against 12·68). Units sold to private consumers for lighting were 249,164 (202,674) and for power 32,476 (33,694), public lamps 165,493 (155,951). Coal cost 0·46d. (0·45d.) per unit sold, works costs were 0·92d. (0·95d.), total costs (including management, &c.) 1·42d. (1·44d.). Redemption of capital required 0·94d. (1·04d.) and interest 0·94d. (1·09d.), and the net profit was 0·20d. (0·06d.).

TRADE NOTES AND NOTICES.

TENDERS INVITED.

Tenders are invited for the supply of telephone, telegraph and electric light material for the year 1911.12, and for the supply of a desiccating plant, to the Postmaster-General's department in NEW SOUTH WALES. Forms of tender, specifications, &c., may be obtained from the Commonwealth offices, 72, Victoria-street, London, S.W. See also advertisements.

The asylum of the Lancashire Asylums Board, WHALLEY, near Blackburn, is in course of erection, and the Committee of Visitors will shortly be prepared to let the contract for the electrical plant, &c. Contractors must send names and addresses by Aug. 7 to Mr. Harcourt E. Clare, clerk to the Committee of Visitors, County Offices, Preston. See also an advertisement.

Tenders are invited up to Sept. 5 for the supply of (*a*) 10,000 protectors and (*b*) sundries to the Postmaster-General's Department in VICTORIA. Tender forms and specifications at the Commonwealth Office, 72, Victoria-street, London, S.W. See an advertisement.

The Corporation of Dublin invite tenders for 12 months' supply of machinery oils for the electricity works, Pigeon House Fort, Dublin. Copies of specification, with conditions of contract (price 5s.), can be obtained from the town clerk, Mr. Henry Campbell, and tenders must reach his office by Aug. 2, 1911. See also an advertisement.

The Municipal Council of BUDAPEST, Hungary, require tenders for the manufacture and supply of plant for a steam-driven electrical generating station, including two groups of three-phase turbo-

Digitized by Google

generators (5,000 kw. each), 10,000 volts 50 cycles boiler equipment for mechanical output of 5,000 kw. with reserve, pipeline, central switching and accessory equipments, travelling crane for engine room and coal-conveying plant. Specifications, &c., can be obtained at the Presidial Section of the Council, 9: IV., Városház-utca 16, II. 1, Budapest. The cable lines are not included in the contract. Tenders must be delivered personally or by a commissioned person to Dr. John Buzáth, Notary of the Council, or his substitute, at the above address, by 11 a.m. Sept. 30. For further particulars see an advertisement.

Tenders are invited by the FARNHAM GAS & ELECTRICITY CO. for the supply and erection of two high-speed Diesel oil engines coupled to two 90 kw. alternators with direct-coupled exciters, piping, tanks, overhead traveller and accessories, and main high-tension switchboard. Specifications, drawings and forms of tender may be seen at, but can be obtained from, the offices of the consulting engineers (Messrs. Handcock & Dykes), 11, Victoria-street, Westminster, S.W., and copies of the specifications, drawings and form of tender may be obtained from the Secretary, to whom tenders by noon, Aug. 16.

LONDON County Council require tenders by 11 a.m. Aug. 1 for installing about 250 lamps at Great College-street elementary school, Rochester-place, N.W. Specifications, &c., from the Chief Engineer, Spring Gardens, S.W.

BRUMBY and FRODINGHAM Council require tenders by Aug. 11 for supply and erection of poles, lamps, wires, &c., for lighting the streets electrically. Specifications, &c., from the Council Offices.

BLACKBURN Guardians want tenders by 9 a.m. Aug. 5 for a 28-point fire alarm for the workhouse.

PONTYPRIDD Council want tenders by noon Aug. 1 for 1,700 ampere-hour battery with motor-driven booster and switchgear. Specification, &c., from Mr. J. E. Tessdel, Treforest.

Tonyrefail and Gilfach Goch Electric Light Co., High-street, TONYREFAIL, require tenders by Aug. 1 for supply and erection of electric lighting mains, switchgear and street lighting fittings. Specifications from Secretary.

Tenders are invited for the supply of 530 a.c. meters, 495 d.c. meters and 133 maximum demand indicators to the City of MELBOURNE, Australia. Copies of specification, conditions of contract and form of tender from the agents for the City Council (Messrs. Mellwraith, McEacharn & Co. Propy, Ltd.), Billiter-square Buildings, London, E.C., to whom tenders are to be sent by noon Wednesday, Aug. 9.

Tenders are invited up to Aug. 23 for the supply of telegraph and telephone material to the Postmaster-General's Department in SOUTH AUSTRALIA. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W.

Tenders are invited (up to Aug. 15) for the supply of (*a*) 80,000 insulators and (*b*) indiarubber covered wire to the Postmaster-General's Department in VICTORIA; up to Aug. 16 for cable, conduits, c.i. pipes, iron poles, insulators, wires, &c.; up to Aug. 23 for the supply of letter box fronts to the Postmaster-General's Department in QUEENSLAND; up to Aug. 23 for telegraph, telephone and electric lighting material to the Deputy Postmaster-General in NEW SOUTH WALES; and up to Aug. 30 for supply of porcelain insulators, copper wire, sleeves, &c., to the Postmaster-General's department in SOUTH AUSTRALIA. Specifications, &c., from the Commonwealth Offices, 72, Victoria-street, London, S.W.

The Metropolitan Water and Sewerage Board, Albert-street, BRISBANE, Queensland, want tenders by noon Jan. 30 next for supply and erection, of one, two or three complete units, each consisting of power generating plant and pump or pumps to lift not less than 6,000,000 gallons per day. Particulars from the Secretary.

MORTLAKE (Victoria) Butter & Cheese Factory Co. require tenders by noon Aug. 14 for supply of dynamo and booster, storage batteries and accessories, switchboard, cables, &c. Specifications from Messrs. F. A. McCarty & Co., 31, Queen-street, Melbourne.

WELLINGTON (N.Z.) Corporation require tenders by 4 p.m. Aug. 24 for supply of a motor power waggon and accessories for the electric tramways department. Gonville and Castlecliff Tramway Board, Ridgway-street, WANGANUI (N.Z.) require tenders by 4 p.m. Aug. 14 for supply of overhead tramway material, feeders, &c. Conditions, &c., can be seen at 73, Basinghall-street, London, E.C. Representation in New Zealand is necessary.

PENTICTON (British Columbia) Municipal Council require tenders by 8 p.m. Aug. 10 for supply and installation of two 100 k.v.a. three-phase 4,600-volt 900 revs. per min. a.c. generators, with pressure pipe line, switchboards, transformers, meters, distribution and street lighting system. Plans, &c., with Mr. F. H. Latimer, consulting engineer, Penticton.

The Generalpostsevrelsens Registratorskontor, Vasagatan, STOCKHOLM, will receive tenders until Aug. 1 for supply of 4,000 to 6,000 16-50 normal c.p. metal filament lamps for 110-250 volts.

Tenders will be received at the Town Hall, SYZRAN, Russia, on Oct. 14, for the construction of an electric tramway and the supply of electrical energy for lighting.

PHILIPPOLIS (Bulgaria) Municipality require tenders by Aug. 4 for a 50 years' concession for electric or gas lighting and for the provision of electric tramways. A deposit of £6,800 is required.

The time for the receipt of tenders by the Ministry of Public Works, Constantinople, for an electric power and tramway concession for JERUSALEM, is extended to Sept. 13. Specifications (in French) can be seen at 73, Basinghall-street, London, E.C.

Tenders will be received at the Prussian State Railway Offices, MAGDEBURG, on Aug. 10 for supply of 270,000 arc lamp carbons.

TENDERS RECEIVED AND ACCEPTED.

St. Pancras (London) Council received the following tenders for cables:—

Western Electric Co. (*accepted*)	£1,352 10 0
W. T. Henley's Telegraph Works Co.	1,383 17 6
Siemens Bros. & Co.	1,396 10 0
British Insulated & Helsby Cables	1,415 4 3
Callender's Co.	1,444 6 0

The tender of E. C. & J. Keay, for erecting boiler house roof and lengthening girders at King's-road generating station, at £261, has also been accepted by St. Pancras Council.

Stepney (London) Council have accepted the tender of the Aron Electricity Meter for supply of 10 special meters required in connection with the supply of current to the Port of London Authority at £164. 5s.

Hammersmith (London) Council have accepted the tenders of Nichols Bros. for feed pump, £190. 15s.; Lucy & Co. for lanterns for side street lighting, bracket and switch, 8s. 10d. each; and the General Electric Co. for hoods, 8s. 3d. each.

Fulham (London) Council have accepted the tender of the British Westinghouse Co. for a switchboard at £210.

Marylebone (London) Council have accepted the tender of the Electrical Co. for supply of lamps for street lighting.

Wm. Geipel & Co. have secured a contract for 68 Geipel steam traps for the new Copenhagen Hospital.

Huddersfield Corporation have accepted the tenders of the United Electric Car Co. for car bodies, and Dick, Kerr & Co. for electrical equipments, for 10 tramcars, the total cost being about £7,000.

Stoke-on-Trent Council have accepted the tenders of the Stirling Boiler Co. for three boilers and accessories, £5,044; and the Davenport Co. for a cooling tower, £1,035.

Swansea Council have accepted the tenders of the Electric and Ordnance Accessories Co. for two years' supply of motors, and H. Billings & Son, for extension of power station and new offices, £3,987. 10s.

Southend Council have accepted the tender of the Worcester Foundry Co. for 47 brackets for the electric lighting of the pier at 16s. 9d. each.

Derby Council have accepted the tenders of W. Rickard (Ltd.) for cables, £913. 13s. 6d.; British Electric Transformer Co., for transformers, £696. 10s.; and A. Reyrolle (Ltd.) for sub-station switchgear, £342.

Blackpool Corporation have accepted the tenders of Wm. Geipel & Co., for Henrion flame arc carbons, and of the Sloan Electrica Co. for Conradty open type carbons. (21 tenders were received.)

York Council are recommended to accept the tender of Callender's Co., at £2,640. 7s. 1d., for supply and laying of h.t. cable for supply to Messrs. Rowntree's works.

Wm. Geipel & Co. have for the third time secured a contract for the annual supply of Henrion open, enclosed and flame type arc lamp carbons (about 1,150,000) to the London & North Western Railway.

Ten electric tramcars made by the Brush Company for the Regina Municipal Tramways, Regina, Saskatchewan, Canada, have recently been shipped from Manchester. There are others to follow.

Sydney (N.S.W.) City Council have accepted the tenders of the Australian General Electric Co. for three transformers (3,200 kw.) £605; General Electric Co., circuit breakers, £601. 12s. 6d.; Union Electric Co., 40 8-ampere a.c. single carbon Excello type arc lamps, £256; Noyes Bros., 50 contact and suspension gears, £115.

Government Contracts.—The British Government Departments have placed orders with the following contractors during June:—

War Office.—Tudor Accumulator Co., storage batteries; Cox-Walkers, boosters, motor, &c.; Western Electric Co., chronograph cable; Mirr-

Digitized by Google

lees. Bickerton & Day, oil engines, &c.; Spagnoletti Limited and British Insulated & Helsby Cables, telephone sets, &c.; H. J. Cash & Co., installation of electric light at Sandhurst Military College.

India Office.—Pritchetts & Gold, accumulators; General Electric Co., cells; Stewarts & Lloyds, pipes; T. Piggott & Co., piping; T. Summerson & Son, switches.

Crown Agents for the Colonies.—Telegraph Construction & Maintenance Co., submarine cable; Hooper's Telegraph & India Rubber Works, river cable, &c.; Tyer & Co., electric train tablet apparatus; National Gas Engine Co., gas engines and producer plant for electric lighting; F. Smith & Co., copper wire.

General Post Office.—Peel-Conner Telephone Works, telephone condensers; British Insulated & Helsby Cables, switchboards and flexible cords; British L.M. Ericsson Mfg. Co., switchboards; Western Electric Co., loop cable; W. T. Henley's Telegraph Works Co. and Siemens Bros. & Co., paper-core cable; Bullers (Ltd.), and Taylor, Tunnicliff & Co., insulators; Edison & Swan Co., Omega Electric Lamp Co., Rugby Lamp Co., and Siemens Bros. & Co., glow lamps; Western Electric Co., telephone exchange extension, Victoria; British Insulated & Helsby Cables, local telephone exchange equipment, Attercliffe; Peel-Conner Telephone Works, local telephone exchange equipment, Bury and Doncaster.

BUSINESS NOTICES.

Mr. A. G. M. Michell, M.C.E., of 413, Collins-street, Melbourne, Victoria, informs us that he has changed his business address, and that in future his practice as consulting and designing engineer will be carried on at third floor, 450, Collins-street, Melbourne, Australia.

The works of Pope's Electric Lamp Co. (Ltd.), Hythe-road, Willesden, will be closed for the summer holidays from Aug. 7 to 12, but a small staff will attend to see to urgent matters.

The partnership between Chas. Wm. Stanley and Joseph Wm. Simpson, electricians, &c., 9, Fort-road, and 5, King-street, Margate, has been dissolved. Debts by Mr. Simpson, who continues.

The offices and works of the British Prometheus Co., Highgate, Birmingham, will be closed on Aug. 2 for the annual holidays, and re-open on Aug. 14. A small staff will be in attendance.

The Dublin branch of the General Electric Co. has been removed to more commodious premises at 13, Trinity-street. (Telephone, "3,300 Dublin"; two lines.)

Frank Saunders (Ltd.) has been registered in New South Wales as a limited liability company. The company acquires the Sydney business of Saunders & Stuart, electrical engineers. The address of the company is 178, Clarence-street, Sydney.

The telephone number of the new offices and showrooms of the Benjamin Electric (Ltd.), at 117, Victoria-street, London, S.W., is 1297 Victoria.

Mr. H. B. Tilley, manager in the Manchester district for Bruce Peebles & Co., has left for a business tour in Canada on behalf of the firm. He expects to be away for fully a year.

Messrs. Newtons (Ltd.), Taunton, notify that the fire which occured in their main foundry on 19th inst. did no serious damage, and they are able to give their usual deliveries, the damage having been promptly repaired.

Patent Development.—The proprietor of patent No. 29,363/1904, for "Improvements in and relating to electrical measuring instruments" desires to enter into arrangements by way of licence and otherwise for ensuring the development and practical working of same in this country. Apply to Messrs. Haseltine, Lake & Co., Chartered Patent Agents and Consulting Engineers, 7 and 8, Southampton-buildings, Chancery-lane, London, W.C.

On the East Coast.—This is the title of an interesting book published by the Great Eastern Railway Co., of which we have to acknowledge the receipt of a copy of the edition de luxe. Prominence is given to some of the less known districts in East Anglia and to the country between the Cromer and Hunstanton coasts and the Norfolk broads. Illustrations are a feature of the book and show some interesting beauty spots on the G. E. system. A copy of the ordinary edition of this publication can be obtained free from the superintendent of the line, Liverpool-street Station, London, E.C.

BANKRUPTCIES, LIQUIDATIONS, &c.

The examination of Chas. Francis, electrical engineer, 66, Liverpool-road, Stoke-on-Trent, took place last week.

Debtor stated that at the date of the receiving order his liabilities were £512. 19s. 11d., and assets estimated at £11. In May, 1904, he commenced business as an electrical engineer in Liverpool-road, Stoke, his capital being £400, money borrowed from his wife. He had never been in a position to pay the money back, and she was scheduled as a creditor for £469. On Sept. 29, 1905, he entered into a partnership agreement with two others to carry on business in co-partnership. They carried on business at a loss until Feb., 1906, when, under a deed of assignment, the effects were realised and a dividend of 1s. was paid, the liabilities amounting to £1,243. From Sept., 1908, to Dec., 1910, he worked for employers. In Dec., 1910, with capital under £10, he again started to trade as an electrical engineer at Liverpool-road, and this business he had carried on up to the receiving order. Failure attributed to household and personal expenses in excess of income.

Examination adjourned to Aug. 15.

The public examination of Cuthbert Fenton Lindop, electrician, 62, Dale-street, Liverpool, was opened at Liverpool on Monday. The statement of affairs showed liabilities £902, assets nil. Debtor stated that he commenced business as an electrical engineer in Oct., 1909, at 62, Dale-street, Liverpool. He had £200 borrowed capital, which he mainly applied towards exploiting an electrical patent advertising sign of his own invention. It had so far proved a failure. He attributed his failure to this and to losses on contracts. Being in financial difficulties, he went, early in the present year, to a solicitor, but saw a clerk. The clerk advised him to form his business into a limited company, and promised to find him working capital. A company was registered on March 18, and on April 26 a debenture purported to have been issued by the company for £100, of which he received £73, the balance being applied in payment of costs of registering the company. He had to get the signatures of two gentlemen as directors, in connection with the issue of the debenture, which was in favour of a gentleman introduced by the clerk. It was a fact, he believed, that, although the articles of association of the company provided for not less than two or more than four directors, with a qualification of 100 shares, no directors, as far as he knew, had been appointed, nor had any shares been allotted. He was to receive 1,250 fully-paid £1 shares in the company. Shortly before June 29, the date of the receiving order, a debenture holder's action was commenced against the company, and the Chancery Court appointed a receiver on behalf of the debenture holders. His brother also signed the debenture referred to, as secretary to the company.

Examination adjourned to Sept. 18.

Emanuel Ristori, civil engineer, 54, Parliament-street, London, S.W., has been adjudicated bankrupt.

In the bankruptcy of Wm. Hy. Ridpath, electrical engineer, 20, Bath-street, Ilkeston, first meeting of creditors on July 31 at 5, Victoria-buildings, London-road, Derby, and public examination on Aug. 2 at 20, St. Peter's Churchyard, Derby.

A dividend is to be paid to creditors of Chas. Hellyer Pearson, electrical engineer, &c., 51A, Mosley-street, and Stockton-street, Manchester, and 4, Manchester-road, Hyde. Claims to Mr. A. Yearsley, 27, Brazennose-street, Manchester, by Aug. 4

The Batley Electric Carbonising Co. (Ltd.) is being wound up voluntarily. Mr. H. Appleyard, Prudential Buildings, Market-place, Dewsbury, is liquidator.

A dividend is to be paid to creditors of Wm. Hy. Illingworth, electrical engineer, &c., 30, Pellon-lane, Halifax. Claims to Mr. W. Durrance, 12, Duke-street, Bradford, by Aug. 2.

A first and final dividend of 8¼d. is payable at 68A, Castle-street, Canterbury, to creditors of Alphonse C. A. Wampach, electrical engineer, Formby Lodge, Seabrook-road, Hythe.

Claims against the Aluminium Corpn. (Ltd.) (which was incorporated in 1907 and went into voluntary liquidation Dec. 9, 1908), by Sept. 1 to Mr. R. Lawson, 60, London-wall, London, E.C. (This notice does not refer to the Aluminium Corpn. (Ltd.), which was incorporated Dec. 17, 1909.)

The discharge of Geo. Montague Sellick, electrical accessories manufacturer, 464, Romford-road, Forest Gate, London, E., is suspended for two years ending June 27, 1913.

COMPANIES' MEETINGS AND REPORTS.

City & South London Railway Co.

The fifty-fourth ordinary general meeting was held on Tuesday, the Right Hon. C. B. STUART-WORTLEY, K.C., M.P., in the chair.

The SECRETARY (Mr. W. F. Knight) having read the notice convening the meeting,

The CHAIRMAN said: We meet you after a record half-year, in which we have carried more passengers than ever and more passengers per train (126·6). Against the first half of 1910 we show increased receipts per train (17s. 11·4d. against 17s. 4·2d.), also increased receipts per train mile 2s. 5·41d., against 2s. 4·37d.), and decreased percentage of working expenses to receipts (45·52 against 47·52). The principal fact that emerges from the accounts is that we have for distribution in dividends a sum increased by £5,663 over last year. This would have enabled us to pay a dividend at the rate of not merely 1¾ per cent., but even at the rate of 2 per cent., and still to carry forward more by £113 than we did this time last year. At the end of the last week before the Coronation we had recorded an increased passenger traffic of £2,363. The two weeks which comprised the Coronation and all the sights and ceremonies that went before and after it brought us increases in traffics of £1,400. We made, moreover, about £600 by letting spaces for the erection of stands. You see, therefore, that these two non-recurring items of profit just about correspond in amount with the £1,850

Digitized by Google

that it would have cost to give you a dividend for the half-year at the rate of 2 per cent. instead of 1¾. The Coronation period, and the exceptionally heavy traffic that it brought us, brought also special responsibilities to our staff, and demanded from them extraordinary exertion during critical periods. We repeated on this occasion the policy that we followed in 1902, of marking the Coronation day by the concession of a day's holiday, or in lieu therefor, a day's extra pay to all ranks and classes of our staff. Of the manner in which their duty was done I cannot use terms of higher praise than to repeat the simple statement made in our report that all ranks worked with such goodwill together that the whole of this extraordinary number of sightseers were brought in and carried back on each of the three days without a single mishap or delay of any kind whatsoever. The new high level subway at the Bank station has now been open for nearly three months, and affords safe and convenient access between our own Bank station and those of the Central London and the Waterloo & City railways. You will approve of our having placed the remainder of our 1903 preference stock. We may have to pay a fractionally higher rate of interest for the money thus realised, but we have got rid of a large debt to the bank, always demandable at short notice. Since our last meeting we have lost, in the late Mr. Ranking, a valued colleague and friend. We have been fortunate in securing for the vacant place on the Board the services of a former general manager and a present director of two great English railways. Mr. Gooday is present with us to-day, and has already given proof of his readiness to give to the service of this company its full share of the skill and energy that have gained him so much distinction in the railway world. When I last addressed you I referred to the speed of our trains. We are advised that without incurring such expense as would involve an application to Parliament, it may be possible so to improve our existing locomotives as to reduce by five or six minutes the time taken in each journey from one end of our system to the other. We have sanctioned the expenditure needful for a practical experiment in this direction. I now move the adoption of the report and accounts.

Mr. CHARLES SEYMOUR GRENFELL seconded the resolution, which was carried unanimously.

A resolution approving the dividends was also carried, and a hearty vote of thanks to the chairman and directors concluded the meeting.

National Telephone Co.

The forty-eighth ordinary general meeting was held yesterday, Mr. GEORGE FRANKLIN presiding.

The SECRETARY (Mr. Albert Anns) read the notice convening the meeting.

The CHAIRMAN said that during the past half-year there had been added to their system 15,675 stations, making the total number of stations on June 30, 549,928. The net result of the half-year's working was a profit balance of £576,277, an increase of £31,761, and out of the available balance of £436,886, the Board recommended the declaration of the usual dividends on the preference shares and of a dividend on the deferred stock at the rate of 6 per cent. per annum. They also proposed to transfer £200,000 to the reserve fund account. During the six months under review upwards of £200,000 was expended on construction of exchange and private stations. The Company's reserve fund totalled £4,059,123, and shareholders were constantly asking him where this sum was. To the extent of £1,839,800 it was represented by solid cash, and by freehold and leasehold properties. As to the balance he could say with some confidence that it would be found in the assets of the Company when these came to be distributed. In the absence of any agreement with the Postmaster-General as to the value of the Company's assets, such value had to be determined by arbitration, and it had appeared to the Board necessary to enter upon the preparation in detail of an inventory of the Company's plant and apparatus, upon which its claims for money compensation must be founded. This task of enumerating and checking the inventory commenced last October. It was occupying the constant time and attention of about 500 employés, and was, of course, a great expense alike to the Postmaster-General and to the Company. The Board anticipated that by the end of the current year this inventory would be completed, and it would be possible then, if necessary, to obtain the decision of the arbitrators as to the purchase price of the various assets to be transferred to the Postmaster-General. Under the provisions of the purchase agreement, they had received notices from the Postmaster-General of objections to purchase a quantity of its plant, land and buildings in what were known as competitive areas, as well as a general notice relating to plant not constructed in accordance with the specification comprised in the purchase agreement. The Board entirely dissented from the Postmaster-General's view, and proceedings were begun before the Railway and Canal Commission. Certain questions of law were decided, generally speaking, in the Company's favour, but that decision was unfortunately reversed by the Court of Appeal, from which Court there was no other appeal. Thereupon the proceedings were resumed before the Railway and Canal Commission, and an arrangement was effected between the Postmaster-General and the Company by which practically the whole of the plant objected to was to be taken over and purchased by the Postmaster-General, certain deductions from the ultimate purchase price of portions of the plant objected to having been agreed to be made by the Company. (Cheers.) He did not wish to say much about that settlement, but it was one which the Directors cordially approved. As to the notices of objection to the character of the plant, he said that the importance of these had been greatly diminished as the result of explanation given to the Court by the Law Officers of the Crown. On the introduction of the Telephone Transfer Bill, they found it necessary to raise objections to certain clauses, which in their view varied the purchase agreement. It was but right to say that, in response to representations made to the Postmaster-General by the Company, certain alterations had been approved which, while preserving to the Postmaster-General the necessary powers required, would at the same time remove the Company's objections to the Bill as at first presented. The difficulties were perhaps serious, and one felt that the Postmaster-General, on his attention having been immediately directed to the question, had met it in a fair, full and frank manner, and the Company had now no cause for complaint. (Cheers.) The Bill also made provision for the Company's staff, and it was due to the Postmaster-General to express satisfaction at the fair and reasonable provision which he offered to make in this regard. He hoped that an application of the same spirit to the case of the principal officers, and others, whose claims were now under consideration, might remove all difficulties, and secure for the Postmaster-General a continuance of the same loyal and devoted service which it had been the good fortune of this Company to enjoy. (Cheers.) He then moved the adoption of the report.

Mr. SAMUEL H. SANDS (the vice-president) seconded the resolution.

The CHAIRMAN, in reply to a question, said the purchase agreement provided for the transfer either on December 31 next or on some day or days to be fixed by the Postmaster-General during 1912. The main question was, of course, the purchase price, and this was still under consideration, and could not be discussed that day, but upon the solution of that question depended in a large measure the date when the actual transfer of the business should take place.

The resolution was passed unanimously.

The retiring Directors (Mr. C. S. Agnew, Lord Harris and Sir Albert Rollit) were then re-elected, and the proceedings terminated with a vote of thanks to the Chairman.

Electric & General Investment Co. (Ltd.)

The twenty-second ordinary general meeting was held yesterday, Mr. J. B. BRAITHWAITE presiding.

The SECRETARY (Mr. S. R. Shaw) read the notice convening the meeting.

The CHAIRMAN read the auditors' report and said: The past year has been an uneventful one. The net result is that we have earned £11,848, as compared with £13,086 in the previous year, or about £1,300 less. That enables us to pay the dividend on the preference shares, distribute the same dividend as last year on the ordinary shares—6 per cent.—and to add a further £2,975 to the contingencies fund, raising it to close upon £79,000. In the balance-sheet one or two changes have taken place of a favourable character. The item Loans against security £19,513 has disappeared, and investments have increased from £244,619 to £250,154. Sundry debtors have increased from £2,714 to £9,208; cash at bankers and in hand from £1,211 to £14,000. On the other side loans from bankers and others have decreased from £48,000 to £45,000. Sundry creditors and open accounts have increased from £22,899 to £28,269. The net result is to strengthen the balance-sheet materially. You may naturally wish to know how the depreciation on our investments is getting on. There, again, I am glad to say the progress made last year in the right direction is still being continued. Last year I said there was an improvement of about £7,000 in the depreciation, and this year, I am glad to say, the improvement is £13,652, so that in the two years there has been an improvement of over £20,000. As I pointed out last year, we have a large interest in the British Electric Traction Co., and you have, no doubt, been glad to notice the improved position of that concern as disclosed in the recent report and balance-sheet, and to see continual improvement in the traffic receipts of their various associated companies which has been steadily going on for a considerable period and recently has assumed very considerable dimensions. The other companies in which we are interested are the City of London Electric Lighting and the County of London Electric Supply, both of which are making very excellent progress. I now move the adoption of the report and accounts.

Mr. EMILE GARCKE seconded the resolution and said it afforded him pleasure to be able to confirm what the Chairman had made note of with regard to the British Electric Traction Co., of which he could speak with intimate knowledge.

In proposing the resolutions approving the dividends, the CHAIRMAN said: As I pointed out to the shareholders last year, the 6 per cent., together with the 6d. per share we are again proposing to distribute out of the reserve fund, gives the ordinary shareholders a return of 8½ per cent., which is not unsatisfactory I think, taking everything into consideration and in view of the sums we have had to put aside to the contingencies fund.

Mr. CECIL J. BULL seconded the resolution, which was approved, and the retiring director, Mr. J. B. Braithwaite, having been re-elected and the retiring auditors re-appointed,

The CHAIRMAN proceeded to set out the Directors' proposals as to the extinguishing of the founders' shares, and submitted a resolution for the adoption of the Board's scheme, which, after a brief discussion, was approved, and this concluded the ordinary meeting.

At an extraordinary meeting which followed of the preference, ordinary and founders' shareholders, resolutions were submitted and approved. Then followed an extraordinary meeting of all classes of shareholders, when the resolutions which had been previously approved were presented and agreed to, and the proceedings terminated with a vote of thanks to the Chairman and Directors.

ANGLO-AMERICAN TELEGRAPH CO. (LTD.)—The report of the directors for the half year to June 30 states that the total receipts from Jan. 1 to June 30, including balance £2,609. 0s. 5d. brought forward, were £191,455. 0s. 11d. The traffic receipts show a decrease of £37,794, compared with the half-year ended June 30, 1910. Working expenses of the half-year were £76,980. 13s. 1d., an increase of £1,328. 2s. 3d. compared with the corresponding period of 1910. In addition there are the expenses of the negotiations with the Western Union Telegraph Co., for which £3,500 has been set aside. The agreement with the Western Union Telegraph Co. is settled in principle and in detail, but is not yet exchanged. It provides for a guarantee of £262,500 a year, payable quarterly (equal to 3½ per cent. on the ordinary, 6 per cent. on the preferred and 1½ per cent. on the deferred stock). In these circumstances the board has decided to place £5,000 only to the renewal fund for the half-year and to credit the interest on sundry securities to revenue account, thus leaving a balance of £105,974. 7s. 10d. Quarterly interim dividends of 15s. per cent. on the ordinarys and £1. 10s. per cent. on the preferred stock were paid on May 1 last, absorbing £52,500. and second quarterly interim dividends of 15s. per cent. on the ordinary and £1. 10s. per cent. on the preferred stock, amounting to £52,500, will be paid on Aug. 1. The balance, £974. 7s. 10d., will be carried forward.

BOMBAY ELECTRIC SUPPLY & TRAMWAYS CO. (LTD.)—At the meeting last week Sir Charles Ollivant, said that in spite of the continuous depression in the mill industry and its adverse effect on the company's traffic receipts further improved results from the working of the tramways had been achieved and was being maintained. The directors had further augmented the rolling-stock by adding 12 more cars. In the electric supply section of the business, for an increased expenditure of about £2,960 the company had obtained an increased revenue of over £9,300. 410 new consumers—increase 38 per cent.—had been secured. The fact that the increase in the revenue was only 16 per cent. was accounted for by the wider introduction into India of metal filament lamps. The new tariff of flat rates came into operation on Dec. 1. This method of charging was more popular than the maximum demand system. The average rate per unit sold to domestic consumers was 4·06d., a shade better than previously. Capital expenditure during the year was £129,882. 4s. 8d. Of this £115,817. 11s. 3d. was expenditure in the electric supply branch, chiefly for the construction of the new power-house at Kussara and new mains. He thought the report gave facts which encouraged the hope that their position by the time they next met might be such as to justify the payment of an ordinary dividend, if only on a modest scale.

CROMPTON & CO. (LTD.)—The report of the directors for the year ended March 31 states that the result of the year's trading, after the usual provision for depreciation, shows a loss of £14,195. 10s. 7d., compared with £20,493. 2s. 10d. for the previous year. After providing for debenture interest and other charges the balance to debit of net revenue account is increased to £48,271. 11s. 11d. The margin of profit obtainable during the financial year on the sale of goods of the company's manufacture has been small, but the demand is steadily improving, and an increase in the turnover is all that is required to enable the company to earn satisfactory profits. Pending the realisation of certain retention monies and other items which tended to lock up the working capital of the company, and which might otherwise have been used to develop the output at the company's works, the directors did not feel that they were warranted in permitting the works to hold so large a stock as in past years, and this reduction has adversely affected the output and the company's profits. The amount of capital so tied up is being gradually reduced, and it is anticipated that further sums will shortly be realised which will be employed for the benefit of the company's business, and this should materially improve the position. The structural alterations at the company's works, to accommodate the head quarters of the sales department, were completed in December last, and the past year's accounts, which had to bear the cost of removal, benefit but little by the saving in expense now being effected.

DUBLIN UNITED TRAMWAYS CO. (1896) (LTD.)—The directors' report for the half-year ended June 30 states that the amount available for division is £51,159. 4s. 8d., and it is recommended that dividends be paid for the half-year at the rate of 6 per cent., less tax, on both preference and ordinary shares; that £4,000 be set aside towards renewal of cars, and £2,000 towards accident insurance reserve, leaving £9,564. 4s. 8d. to be carried forward.

EAST LONDON RAILWAY CO.—At the meeting on Tuesday Lord CLAUD HAMILTON, M.P., said shareholders would have noticed in the report an expression of regret that no definite statement on the subject of the electrification of the line could be made. He was very glad he was now able to make a statement on the matter. The steps he had taken to get the six lessee companies into line in regard to the electrification had resulted the previous day in a special meeting of the Joint Committee when a resolution was passed practically ensuring the immediate electrification of the company's lines. The cost was estimated by the engineers, allowing for contingencies, not to exceed £65,000. Their solicitors advised that one of the lessee companies, if they thought fit to do so, should incorporate clauses in their next Bill taking steps to raise the money and ensuring the due payment of the interest of 4 per cent. by the other lessee companies or by the East London Company itself. It was believed that the extra working expenses incidental to the electrification of the line would be £3,000 a year, and that the lessee companies expressed their willingness to bear. He had always gone into this question of electrification with a very confident spirit that, having regard to the results of the electrification of the Metropolitan and District, and especially the Brighton line, the traffic receipts under a system of electrification would increase to an extent far in excess of their anticipations. He therefore did not think there was the slightest danger in agreeing to pay £2,600 a year interest on the necessary outlay for the electrification of the line. The District Co. were prepared to supply current from Lots-road, and the Metropolitan Co. felt that they could supply the necessary rolling stock.

FRENCH WESTINGHOUSE CO. (SOC. ANONYME WESTINGHOUSE).—The report for 1910 states that the result shown by the establishments at Freinville was a debit balance for the year of 131,534fr. (£5,261), due to the poor financial return made by the electrical departments. It is proposed to reduce the capital from 20,000,000 to 14,000,000fr.

LANARKSHIRE TRAMWAYS CO.—The directors' report for the half-year to June 30 shows that the result of the half-year's working is a revenue of £36,532. 9s. 5d., against expenses £19,359. 15s. 2d., leaving £17,172.14s.3d. Contributions payable to local authorities and interest amount to £2,166. 10s. 1d., leaving a balance of £15,006. 4s. 2d., or with £1,499.9s.10d. forward, £16,505. 14s. Dividend at the rate of 5½ per cent. for the half-year on the issued share capital requires £9,432. 10s., and £7,073. 4s. is transferred to revenue account. The traffic receipts show an increase of of £320 and the expenses a decrease of £1,240 compared with the corresponding half-year of 1910. The new Stevenston extension will be completed and opened for traffic early in August. Four additional cars have been ordered, and will be put into service shortly. The directors will, as usual, provide for depreciation when the final accounts are made up at the end of the year.

LIVERPOOL OVERHEAD RAILWAY CO.—The accounts for the past half-year show an available balance of £10,841. 6s. 1d., and the directors have resolved to recommend payment of dividends at the rate of 5 per cent. on the preference, and 1 per cent. on the ordinary shares, leaving £4,665 9s.1d. to be carried forward.

LONDON, BRIGHTON & SOUTH COAST RAILWAY CO.—The report of the directors for the half-year ended June 30 states that the gross revenue was £1,662,068, against £1,607,947 for the corresponding half of last year. Working expenses were £1,029,135, against £1,008,465. The increase of revenue arises almost entirely from passenger traffic, which has advanced both in numbers and money, and the electrical services have contributed materially towards this result.
